APPLES

Do well in

**BUTTE VALLEY
CALIFORNIA**

and

**ROGUE RIVER VALLEY
OREGON**

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

COLONIZATION AGENT

Union Pacific Railroad

OMAHA, NEBR.

ARE YOU GOING TO

California

Washington, Oregon

Idaho

Or Any Other Point?

Take the

Union Pacific Railroad

Daily Tourist Car Line

BETWEEN

Chicago, Missouri River, Colorado,
Idaho, Oregon, Washington and
California Points.

TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

Be sure to buy your ticket over

The Union Pacific Railroad

known as the Overland Route, and is the only direct line from Chicago and the Missouri River to all principal points West. Business men and others can save many hours via this line.

Here's Your Chance for News

FROM

BUTTE VALLEY

Mr. E. T. Merritt, who so successfully colonized Green River, Utah, with first-class farmers from the East, expects to return to Butte Valley in January with a large party of Eastern farmers, whom he is interesting in the choice lands north of town. He has already sent in Mr. A. W. Stow, who expects to contract for 80 acres on which to start a dairy farm from which to supply the residents of Macdoel with milk and butter. Mr. Stow is very enthusiastic as to the future of Butte Valley.

Mr. Isaac C. Root, the father of D. J. Root, arrived from Oklahoma, Thursday, and told his son on arrival that he is very much pleased with Butte Valley.

Mr. F. J. Higdon from Vancouver, Washington, who is a cousin of D. J. Root, also came in on Thursday, and was very enthusiastic in his expression during a drive over the Valley.

Mr. D. C. Campbell and Mr. Geo. L. McDonald, Colonization Agents of the Union Pacific Railroad, visiting their many friends in the Valley, are showing photographs of an exhibit at the International Livestock Exposition held in Chicago the early part of this month, which shows a very creditable exhibit of Butte Valley products which they say was admired by several citizens of Yreka who visited the exposition.

Mr. Ford of Newcastle, Cal., is now in the Valley looking up a location for a number of friends from that section who wish to locate in Butte Valley.

Mr. E. E. Hunt of Le Grand, Cal., who expressed himself so well pleased with Butte Valley when he was here recently, writes that he hopes that he and his mother will be living in Butte Valley in the near future.

Mr. Alva Sword and wife, and Mr. Collin Puterbaugh and wife of Lanark, Ill., who purchased land in Butte Valley in August of last year, were driving over the Valley Tuesday and Wednesday of this week and stated that they considered Butte Valley lands a good investment, which is not surprising as they can double their money now, but still they are not willing to sell at present prices.

Mr. Ezra Ewing and wife of Lanark, Ill., were with the party and were pleased with the surroundings here.

Mr. Charles Bigham, formerly of Colfax, Ind., and Miss Elva Lizer, formerly of Mt. Morris, Ill., were married on Christmas Eve.

Mr. D. B. George and wife from Champaign, Ill., are expected here next week. This will be Mr. George's first visit to the Valley, although he has owned land here for some time.

Mr. David Plum of Polo, Ill., purchased another half section of Butte Valley land last week. Butte Valley could not have a stronger endorsement as to the value of her lands than the fact that this is the third purchase made by Mr. Plum in the Valley. Mr. Plum is recognized as an expert farmer who knows good land when he sees it. He has expressed his intention of putting these lands in cultivation, thus realizing on his investment as well as enhancing the value of the land.

The citizens of the Valley are much gratified to learn that Mr. D. C. Campbell of Colfax, Ind., and Mr. Isaiah Wheeler of Cerro Gordo, Illinois, are arranging to bring an excursion party to Butte Valley, leaving Chicago, Tuesday Jan. 14 and Omaha, Wednesday Jan. 15, and are advising their friends to correspond with these gentlemen so as to secure berths in sleeping cars on this excursion, so as to avoid all changes of cars from Chicago to Butte Valley.

TWO EXCELLENT LITTLE VOLUMES

BOOK OF PRAYER FOR EVERY-
BODY AND ALL OCCASIONS.

A manual of everyday prayers carefully selected from many sources for those who desire greater unction and more freedom in prayer in public. It contains a large variety of prayers for church service, family worship, prayer meeting, Sunday school, etc. You are sure to receive much benefit from this little volume.

Handy pocket size. Price in red morocco binding,35 cents

THE DAILY ALTAR.

By J. H. Jowett.

This is a new book just out and promises to be a valuable one. A brief suggestive prayer for each day of the year. To follow these throughout the year as a morning meditation, for a few moments along with your regular scripture reading cannot help but be productive of good. 32mo. Cloth bound.

Price, each,25 cents

Brethren Publishing House,
Elgin, Ill.

Eternal Verities

By D. L. Miller

NOT A DRY PAGE

A welcome volume to Christian Apologetics on the lines of Pierson's "Many Infallible Proofs," Gladstone's "Impregnable Rock of Holy Scripture," Sayce's "Fresh Lights from Ancient Monuments."

The author's considerable travels in Palestine have been a great help to him in the preparation of this book which is marked throughout by a manly tone born of convictions formed with full knowledge of opposing theories. There is not a dry page, nor a dull paragraph in the book. The numerous illustrations are drawn with accuracy and high finish.

RAISIN CITY COLONY

Owned and Controlled by BRETHREN

Twelve ministers have purchased land at RAISIN CITY. Regular services are held every Sunday.

POSTOFFICE

is now established with A. W. Vaniman Postmaster. The Hotel is now completed and doing a prosperous business. Rasin City Lumber Company has a large stock of Lumber and is doing a flourishing business.

RAISIN CITY is located on the Southern Pacific Railroad, 14 miles from Fresno, a city of 25,000.

DAIRYING AND STOCK RAISING.

This land is especially adapted to dairying and stock raising as it is the home of the alfalfa.

RAISINS, PEACHES AND FIGS.

Fresno County, in which RAISIN CITY is located is the greatest fruit producing county in the world, 80,000 acres in grapes.

SOIL AND WATER.

The soil is a rich, sandy loam; the land is generally level and ready for the plow; and abundance of good water.

PRICES AND TERMS.

We are selling the land at from \$25 to \$50 per acre on 4 years time at 6 per cent.

LOS ANGELES, CALIFORNIA

WASHINGTON

I have decided to drop my Dakota farm, to make more room for Washington. The farm is a good one, and can be bought at a bargain if taken soon. Write me for circulars describing it.

In my last letter I was telling about the big yields and how land values have advanced. Now I want to tell you a little about how we irrigate in the Columbia and Wenatchee Valleys. We are in a mountainous country where rivers usually have lots of fall.

The water is taken out of these rivers by means of large canals, and carried for miles, allowing just enough fall to give the water the desired speed in running. Here the High Line Canal (as we call it) will be thirty miles long when completed. In this distance we get the water (by taking up the fall) at a good height. From this main canal the water is taken out in smaller ditches, called laterals, and conveyed to the land. Then where the land is level, the water is run across the one end of the land to be irrigated, in a small ditch, or in a box flume, and from these into little ditches (or furrows as we call them), made with the shovel plow, or a shovel attached to your cultivator. When the water is turned into these little furrows, we follow up with a hoe, and see that the little ditches are clean, so that the water can run to the other end of the ditch, otherwise it would spread out over the land. For fruit trees we should make from three to five applications in the season, and for berries and vegetables once a week is better. Some seasons it requires much less water than others, owing to the amount of snow and rain in winter and spring. Now after all this is arranged, it requires very little attention. The water is most generally let run from one to two days. Then as soon as it is dry enough, follow up with the cultivator to keep the moisture in the ground.

Now the most of you know that if you have rain in proper season and proper amount, (other conditions favorable) you are most sure to get a crop. We have these conditions, then we need not worry about drouth, or too much rain. We fear no hail, this gives us satisfaction of mind, makes crop failures unknown, (crop failure is unknown here). By having irrigation we are not only assured of a crop, but large crops. You plant your potatoes in the dry ground, and it remains dry till they set on. Very few will set on, that is a fact, and if you can give them moisture just at the time they need it you have a crop, if you have moisture to follow with, as they need it. Here is the secret of success. By having moisture at the proper time, our crops mature large yields and larger fruit, hence high prices.

When we tell the eastern men that we are getting more for a 48-pound box of apples than New York and Michigan or other eastern apples will bring per barrel, they stare at us. Again, we tell them we get from \$1.25 to \$3.25 per box of apples then they wonder. Then we tell them trees from six to ten years old will yield 8 to 12 boxes to the tree, and full-grown trees 20 to 60 boxes to the tree, they doubt this, but these are facts.

We do not wonder at it. I was born and reared in Indiana, and I know the conditions of fruit growing there. I was so prejudiced against fruit raising that when people got to telling us about the Wenatchee Valley orchards, I gave it no thought, I would not consider it. While they were telling their story, my mind would wander elsewhere, but finally here comes a report, saying that Charles Cooper last year got \$2,000 worth of Wine Sap apples per acre, and now he is riding in his automobile. "Well," says I to myself, "that sounds pretty good, that is like selling a farm each year." (Mr. Cooper got \$13,000 from his orchard this year.) "Old Boy, you must wake up, that beats raising wheat here in North Dakota. Better look after this matter; you might be surprised." Now in my next I will tell you why we get the large yields, high prices, for land and fruit, rapid increase in value, such fine fruit, how we spray, etc. I will give you a few statements, from others, please read them. If you have money you want to invest, write me. If you are in search of business location, write me. If you want to engage in manufacturing, write me. Later I will try to devote a little space to telling you about East Wenatchee.

Be sure to write me for printed matter.

Daniel Gensinger,

Wenatchee, Wash.

Possibilities of IDAHO

Unlimited

Many Brethren are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for Brethren and others of small means to get good comfortable homes with a splendid income.

Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

Realize \$1,000.00 Per Acre

Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

HOMESEEKERS' ROUND TRIP TICKETS

No. 1.

THE UNITED STATES NAVY

I. Effectiveness of Battleships.

It is a difficult matter to find a basis of comparison of the strength of the world's navies which will give satisfactory results. A mere statement of the total number of ships in each navy will not suffice, since these ships vary in size, speed, armor, and armament. It has been claimed that a comparison based on the total number and weight of guns carried would suffice; but the value of a gun depends greatly upon the character of the ship which carries it, the kind of mount upon which it is placed, the degree of armor protection, and so forth. Because of these modifying conditions, a 12-inch gun in one ship may expect to have two or three times the battle-life and efficiency of a 12-inch gun in some other ship. Nor will a comparison on the basis of armor protection suffice; for a fleet which is powerful only in its defensive qualities, and in which the area and thickness of its armor plating has been increased at the expense of the armament and the speed, would be wanting in that mobility and power to swiftly concentrate and deliver a telling blow

A Submarine Vessel Preparing to Dive.

at the critical moment, upon which the success of a naval campaign so greatly depends.

Then, lastly, and perhaps most important of all, there is the question of age. We do not recall any product of human industry which, as the years go by, depreciates so rapidly in value as the warship; and the most elaborate estimate of the relative value of the fleets of the world is not worth the paper it is written on, unless the question of the age of the ships be most carefully considered. Warships built today have at least twice the value of those built ten years ago, and from four to six times the value of those built twenty years ago. Great Britain awoke to this fact and swept over one hundred warships off the list, and placed them under the auctioneer's hammer.

If the present popular theories are correct, the navy which can place on the shortest battle line the largest number of 12-inch, or other heavy pieces of modern design, is certain to win the fight.

The battleship of the future will be of great size; displacement will be not less than 20,000 tons; and this will increase so rapidly that a 30,000-ton ship will probably be afloat before the close of the next decade. The main armament will consist exclusively of heavy guns of not less than 12 inches caliber; and, if the difficulty of erosion can be

The Octopus Arising from a Dive. 24 Hours Under Water.

overcome, the 12-inch will give place to a 13-inch and, possibly, to a 14-inch piece. Future engagements will be fought at an extreme range, the extent of which will be limited only by the ability of the fire-control officer to see the fall of the shots. The determination of the range at which an engagement shall be fought will lie with the fleet which possesses the fastest speed.

Unquestionably, the victory in future engagements will lie with the fleet which is able to concentrate the largest number of heavy guns within the shortest line of battle. Hence the certainty that the navies of the world have been forced into a contest of size, the end of which no one can foretell.

projectiles, it is now generally conceded that the greater destructive effects and the greater certainty of hitting of the 12-inch overbalances the advantages of greater rapidity of fire of the lighter guns.

The method now adopted to find the range of a target is to have a "fire-control station" in some lofty position on the ship, and find the range by trial shots. The observing officer notes the splash of the shell and telephones the result to the gun, and the elevation is changed until a hit is made. Now, when three or four calibers of guns are firing indiscriminately, it becomes difficult to distinguish the splash of one caliber of shell from that of another. With one type of gun on the ship, there can be no error

The Krupp Cannon Works, Germany. 20,000 Men are Employed Here. Many of our Large Cannons and Armor Plate for Battleships are Made Here.

In the Japanese war the range was about 5,000 yards, and in future wars will probably be 7,000 and over. But at long ranges it is only the larger guns that can do effective work against an armored ship; and it has come to be pretty generally conceded that for this purpose the 12-inch piece is the most satisfactory. It is true that the 50-caliber, 9.2-inch gun, and long-caliber pieces of 10-inch and 11-inch caliber, are also armor-piercers at this range; but it takes the 12-inch gun to get through belt, barrette, and turret armor, and the destructive effect of the heavier projectiles is enormously greater. Furthermore, the flatter trajectory, or curve of flight, of the larger gun means a much wider danger space; that is to say, the 12-inch piece can hit a ship with a much wider margin of error in elevation than a 9.2-inch or 10-inch gun; and, although the smaller gun will deliver more

of this kind, and the fire can be directed with great accuracy. For this reason future battleships will have only one size gun.

As to the size of the future gun, there are indications that it will steadily increase. Already, Great Britain is manufacturing a new and extremely powerful 13½-inch piece for her new twelve-gun ships. The advantage of size is not only that the bigger gun is more accurate, but that it holds its velocity longer, and its striking energy is therefore proportionately greater at the longer ranges.

II. The Growth of the United States Navy.

At the close of the Spanish war the United States navy included but four first-class battleships; and these have been so far outbuilt that today they are relegated to the class of coast defense vessels. These

were the "Oregon," "Indiana," "Massachusetts," and "Idaho." The first battleships to go into commission after the close of the war were the "Kearsarge" and "Kentucky," built at Newport News.

The next addition of battleships to our navy consisted of the three vessels of the "Alabama" class, namely, the "Alabama," "Wisconsin," and "Illinois."

On May 4, 1898, Congress authorized the construction of three battleships, the plans of which very close-

for an increase in the motive power. The "Alabama" class are 368 feet between perpendiculars, and the "Maine" class 388 feet, the other dimensions of the hull being identical throughout. The additional 20 feet of length raised the displacement from 11,552 tons in the "Alabama" to 12,500 tons in the "Maine"; and enabled the horse-power to be increased from about 11,000 to 15,603, with the result that on trial the "Maine" accomplished 18 knots. The "Maine"

was built at Cramps, the "Missouri" at Newport News, and the "Ohio" at San Francisco. The additional length made it possible to mount an extra pair of 6-inch guns in the central battery, and the 35-caliber 13-inch gun of 2,100 foot-seconds velocity, gave place to the new 40-caliber 12-inch piece of 2,700 foot-seconds velocity. This resulted in a saving of 40 tons in the weight of the four guns, and a gain in penetration of from 12.5 inches at 3,000 yards for the 13-inch to 16.3 inches at the same distance for the 12-inch piece.

Copyright, 1907, by Funk & Wagnall Company, New York

"ALABAMA" "MISSOURI" "KANSAS" "RHODE ISLAND" "LOUISIANA" "GEORGIA" "KENTUCKY" "ILLINOIS" "NEW JERSEY" "VIRGINIA" "MAINE" "DESTRUCTOR" "KLEARSARGE" "OHIO" "MINNESOTA" "CONNECTICUT" "VERMONT"

The Atlantic Fleet Now on its Way to the Pacific. Enough More Battleships are Under Construction to Duplicate the Above Fleet in the Near Future.

ly followed those of the "Alabama" class, the idea being to have a homogeneous squadron of six identical vessels. When it was learned, however, that the contract speed of these ships was to be only 16 knots, which was about two knots slower than the speed of many foreign battleships, which were under construction at that date, there was a strong agitation in favor of the modification of these ships, which led to a revision of the plans to the extent of lengthening them by 20 feet, in order to provide the necessary space

battleships had all been protected with Harvey-ized armor; but in the "Maine" class, for the first time, the Krupp armor was employed, and it has been used in all subsequent battleships. Because of its higher resisting qualities, it was possible to reduce the thickness of the armor all around, the belt being 11 inches and the turrets 12 inches in thickness as against 16½ inches and 14 inches respectively in the "Alabama" class. The bow 12-inch guns are carried at a height of 26½ feet above the water, the

after 12-inch at a height of 19 feet. All four 12-inch can be loaded in any position, and both the hoisting of the ammunition and the maneuvering of the guns are done electrically.

The Congress of 1899 authorized the construction of three, and the Congress of 1900 of two first-class battleships, which today constitute what is known as the "Georgia" class. These ships are the "Georgia," "Nebraska," "New Jersey," "Virginia," and "Rhode Island." These ships represent a great advance in size, speed, and power over the "Maine"

power, and speed. The first six vessels form, like the ships of the "Georgia" class, a homogeneous squadron.

In the "Connecticut," as compared with the "Georgia," the length was increased by 15 feet, the beam by 7½ inches, and the draft by 9 inches, the displacement being raised from 14,948 tons to 16,000 tons. The battery, however, is greatly increased in power, the latest pattern of 45-caliber 12-inch gun being mounted in these ships for the first time in our navy. The fire in any direction from these ships is heavy,

consisting of two 12's, four 8's, and two 7's ahead and astern, and four 12's, four 8's, and six 7's on the broadside. They are provided with four submerged torpedo tubes for the new turbine torpedo, and they have the large coal supply of 2,200 tons. Both the "Connecticut" and "Louisiana" exceeded their high contract speed of 18 knots with 16,500 horse-power. The "Connecticut" is particularly interesting, at the present time, as having been selected as the flagship of the Pacific fleet, special accommodations for this purpose having been provided when the ship was under construction. It is also to be remembered that the "Connecticut" was built entirely at a government navy yard, contemporaneously with the construction of the "Louisiana" at a private yard. The high character of work on the "Connecticut," and the fact that she was built in the

The Navies of the World Compared on Number of Men Enlisted. The United States is Second in Battleships, but Fifth in Enlisted Force.

class. The length is increased to 450 feet, and the beam to 76 feet 10 inches. The displacement is increased from 12,500 in the "Maine" to nearly 15,000 in the "Georgia," and the speed is 19 knots. In these ships was mounted, for the first time, the new powerful turbine-driven 21-inch torpedo, for the firing of which each ship carries four submerged torpedo tubes.

Following the "Georgia" class came the authorization in 1902 of the "Connecticut" and "Louisiana," and in the following two years of the "Kansas," "Minnesota," "Vermont," and "New Hampshire." In the same year also were authorized two battleships, the "Idaho" and "Mississippi," of less size,

same time as the "Louisiana," and that her extra cost, in view of the higher pay and shorter hours of government employees, was less than was expected, has established, conclusively, the ability of the government to do the very highest character of work at a reasonable cost in its own yards.

By far the most important ships building for our navy today are the two big battleships "North Dakota," under construction at the Fore River yard, and "Delaware," now building at Newport News, Va. These ships, to use the current phrase are the "answer" of the United States to the battleships of the "Dreadnought" type, which are being constructed for

other navies. The speed has been raised to 21 knots, and the bunker capacity is also very large. The system of mounting all guns on the center line of the ship, adopted in the "South Carolina" and "Michigan," has been followed, with the result that their broadside fire is twenty-five per cent greater than that of the "Dreadnought," and will probably equal that of any battleship afloat at the time they will go into commission. The ships will be 510 feet on the waterline, 85 feet 25/8 inches in maximum breadth, and will displace on trial 20,000 tons on a mean draft of 26 feet 10 3/4 inches. On trial they must carry 1,000 tons of coal in bunkers whose total capacity is 2,500 tons, and the speed must be 21 knots.

Four of the guns have a command of 24 feet, four of 30 feet, and one pair, the second pair from the bow, is carried at a height of about 36 feet above the water. The battery of fourteen 5-inch guns for repelling torpedo-boat attack is mounted in broadside; two of the guns forward in the bow in sponsons, so arranged that each has a slight arc of fire across the axis of the ship. The armor protection is unusually complete, superior even to that of the "South Carolina" and "Michigan." The belt is 11 inches thick by 8 feet in width, and above it the side of the ship is protected by a secondary belt 7 feet 3 inches wide and 10 inches thick.

Constitution of Admiral Evans' Fleet.

First Squadron.

Grand Totals—Ships, 35; guns, 1,011; officers and men, 14,338.

Note—Destroyers and most of fleet auxiliaries preceded sailing of battleships.

In addition to the above fleet the United States has already built since the war with Spain or has under contract 9 battleships and 31 cruisers, and fifty smaller war vessels. Our naval expense is nearing \$200,000,000 annually and the beginning is only made.

Cruisers and Submarines.

During the Spanish war, the armored cruiser gave such clear demonstration of its value, that it was not long before Congress had authorized the construction of a powerful class of five of these ships, to embody the latest ideas for this type. The class includes the "California" and "South Dakota," built at San Francisco; the "Colorado" and "Pennsylvania," built by Cramps; and the "Maryland" and "West Virginia," built by the Newport News Shipbuilding Company. These ships are 502 feet long, 69 feet 6 1/2 inches beam, and 24 feet 1 inch draft, on which draft they displace 13,680 tons. The protection consists of a continuous belt from 6 to 3 1/2 inches in thickness, associated with a deck having a thickness of 4 inches on the slopes, and 1 1/2 inches on the flat. The main battery of four 8-inch guns is carried in two turrets forward and aft, and the fourteen 6-inch guns are mounted in a central broadside battery and in casemates, ten of the guns on the gun deck and four on the main deck.

The ships were designed to make 22 knots with 22,000 horse-power, but this was in every case exceeded, the "Pennsylvania" making 22 1/2 knots. The ships carry a maximum supply of 2,000 tons of coal, and each is fitted with two 18-inch submerged torpedo tubes. Subsequently, four cruisers were authorized, which are nearly 1,000 tons larger than the "California" class, and embody improvements in the armament and armor plan. These are the "Washington," built by the New York Shipbuilding Company; the "Tennessee," built at Cramps; and the "Montana" and "North Carolina," now building at Newport News.

Although the ships of this class are the equal of those armored cruisers of foreign navies designed at the same date, they are entirely outclassed by the later armored cruisers of other navies, such as the Japanese "Tsukuba," with its four 12's, twelve 6's, and twelve 4.7's, and the British "Invincible" class, carrying eight 12's and sixteen 4-inch guns.

We have recently added to the navy three protected cruisers which, in view of developments since the Japanese war, are of doubtful value. These are the

"Charleston," built at Newport News; the "Milwaukee," built at San Francisco; and the "St. Louis," built by Neafie & Levy, of Philadelphia. In view of the size of these ships, 9,700 tons, it is unfortunate that they should be so poorly protected. Their armor plans show a protective deck only 2 to 3 inches in thickness, and a partial belt of 4-inch armor, with 4-inch armor for the protection of the central battery. The fighting value of these ships is small; though they are no worse than the contemporary British ships of the "County" class, several of which have visited our eastern harbors in recent years. They will be useful for scouting purposes; but could engage only ships as poorly protected as themselves.

mentation and practice, is 54 feet in length over all, of 10 feet 3 inches beam, and of 74 tons displacement when submerged. She is driven on the surface by gasoline engines of 45 horse-power, and when submerged by an electric motor of 50 horse-power. She carries one torpedo tube. The other seven submarines are enlarged and improved "Hollands," 63 feet 10 inches in length, 11 feet 10½ inches in diameter, and of 122½ tons displacement submerged. The motive power consists of a 160-horse-power gasoline engine, which drives them at about 8½ knots on the surface, and a 70-horse-power electric motor which gives them, when submerged, a speed of about 7½ knots. In 1904 Congress authorized the construction of four

Where Big Guns are Tested. See Armor Plate in Background at Which Shots are Fired.

The Congress of 1899 authorized the construction of six small unarmored cruisers, which are known as the "Chattanooga," "Cleveland," "Denver," "Des Moines," "Galveston," and "Tacoma." These vessels were designed to serve as "station ships;" that is to say, their duty, in times of peace, is mainly to cruise on foreign stations, and in time of war perform various naval duties which would not call for vessels of either great speed or serious fighting power.

The fleet of twelve submarines of the United States navy has been created entirely since the war, with one exception, the "Holland" being constructed several years prior to that time. In the following year seven additional submarines, known as the "Adder," "Grampus," "Moccasin," "Pike," "Porpoise," "Shark," and "Plunger," were authorized and subsequently built at Elizabethport, N. J. The "Holland," which was purchased for purposes of experi-

additional submarines of much greater size and efficiency. Three of these, known as the "Cuttlefish," "Tarantula," and "Viper," are of one type, the "Octopus" being larger than the others. Although they follow broadly the general design of the earlier boats, they are much more powerful, have a wider radius of action, are of greater structural strength, of higher speed, and possess superior maneuvering qualities. The three submarines of the "Cuttlefish" type are about 80 feet long over all, 12½ feet in diameter, and displace 175 tons. On the surface they are driven by gasoline engines at a speed of 10 knots, and in the submerged condition the electric motors have driven them over the mile course at a speed of 9 knots. They are supplied with a submarine bell signal system for communication with the surface. They submerge by filling various ballast tanks distributed throughout the boat. The reserve of buoyancy when in div-

ing trim is from 500 to 1,000 pounds. To navigate the boat submerged the propellers are started, and by means of the diving rudders, which are turned downward, the axis of the vessel is inclined by the bow from 5 to 10 degrees. To maintain submergence after reaching the desired depth the diving rudders are shifted and the boat is thus held at the required depth. The process of diving is as follows: Water is admitted to the ballast tanks until buoyancy is reduced to the desired degree, which is generally between 500 and 1,000 pounds. The propellers are started and the diving rudders put down, the vessel descending on a downward incline.

In the test of the automatic devices for blowing the ballast in order to allow the Octopus to come to the

close ranges at which the running fight was carried on, the number of hits, as determined by a careful subsequent investigation by our naval officers, was only two out of every hundred shots fired. Since the close of the war, our Naval Bureau of Ordnance has developed a powder which is giving high velocities, with a relatively small amount of erosion. The bureau early became satisfied that, if erosion was to be kept within reasonable bounds, it was necessary to eliminate the powerful but erosive nitroglycerin, and develop, if possible, an all-nitrocellulose powder.

The velocity of the guns used in the Spanish war was only about 2,000 to 2,100 feet per second, the velocity in our present guns is from 2,700 to 2,800 feet per second.

Over 60 Feet Long; Not Used on Vessels but in Harbor Defense. It is so Mounted that it Can be Raised Above the Breastworks When Ready to Fire and Then Lowered to Reload.

surface in case of accident, she rose from a depth of 40 feet in 43 seconds. In the twenty-four hours' submergence test in 30 feet of water, she carried down a crew of sixteen men, and came to the surface next day with the men in good condition. The "Octopus" has been tested as to strength and water-tightness by actual submergence to a depth of 200 feet.

III. Guns and Armor.

If the primary function of a warship is to give and take hard knocks, it is not stretching the point too far to say that the greatest development in our navy during the past ten years has been in the matter of guns and armor.

At the battle of Santiago our ships were at times absolutely enveloped in dense billows of the smoke of their own guns; and, in spite of the comparatively

That the remarkable increase in the fighting power of the ships of the Pacific fleet is due to the improved guns and powder, is well shown in the accompanying tabular comparison of the total energy of fire in five minutes of the battleship "Oregon" of Sampson's fleet at Santiago and the battleship "Rhode Island" of the Pacific fleet. The total energy of all guns firing at their maximum rate of speed, with carefully aimed shots, was for the "Oregon" 819,456 foot-tons; whereas the total energy of all guns during the same time on the "Rhode Island" would be 3,927,172. The increase in efficiency of the modern gun is largely due, moreover, to the greatly accelerated rate of fire; and this has been rendered possible by improvements in the mounting of the gun and in the breech mechanism and loading arrangements.

Undoubtedly the most interesting gun carried in Admiral Evans' fleet is the new 45-caliber piece, which weighs 53 tons and is 46 feet in length. It fires a projectile weighing 870 pounds with a charge of smokeless powder weighing 335 pounds. The projectile leaves the muzzle with a velocity of 2,700 feet per second, and a corresponding muzzle energy of 44,025 foot-tons; or sufficient to lift the "Lusitania" bodily out of the water.

Comparison of Total Energy of Gunfire in Five Minutes of Battleships "Oregon" (1897) and "Rhode Island" (1907).*

Oregon in 1897.			Rhode Island in 1907.		
Guns	Muzzle Energy, Ft.-Tons	Muzzle Energy in Five Minutes Firing, Ft.-Tons	Guns	Muzzle Energy, Ft.-Tons	Muzzle Energy in Five Minutes Firing, Ft.-Tons
4 13-inch	33,627	269,016	4 12-inch	44,025	726,412
8 8-inch	8,011	320,440	8 8-inch	18,647	1,091,780
4 6-inch	2,980	119,600	12 6-inch	5,714	1,714,200
20 6-pdrs	138	110,400	12 3-inch	658	394,800
Total energy all guns in five minutes		819,456	Total energy all guns in five minutes		3,927,172

IV. Warship Tonnage of the Principal Naval Powers.

On a given amount of displacement, two competent naval architects will produce two ships which, while they may differ very widely in details, are apt to represent about the same amount of military efficiency in the total. What one gains in gun power, the other will exhibit in superior armor protection. Where one excels in speed the other will show great endurance or cruising radius, and so on. And if in estimating the strength of two navies by displacement a proper deduction be made of obsolete ships, and only those be included in the comparison which have real fighting value, a fairly accurate rough-and-ready estimate of relative power may be obtained. This is the principle of comparison which has been followed by the Office of Naval Intelligence of the Navy Department in a table which they have just issued showing the comparative warship tonnage of the principal naval powers. The vessels excluded from this comparison are as follows: Those over twenty years old unless they have been reconstructed and rearmed since 1900; transports, colliers, repair ships, torpedo-depot ships, converted merchant vessels or yachts; vessels of less than 1,000 tons, except torpedo craft of less than 50 tons. With reference to the table summarizing the number of ships of each class possessed by the navy, it should be noted that battleships of the first class are those of about 10,000 tons or more displacement; that under the head of cruisers are included all unarmored cruising vessels above 1,000 tons displacement; and that under coast-defense vessels are included the small battleships and monitors, regarding

which it should be noted that no more vessels of this class are being proposed or built by the great powers.

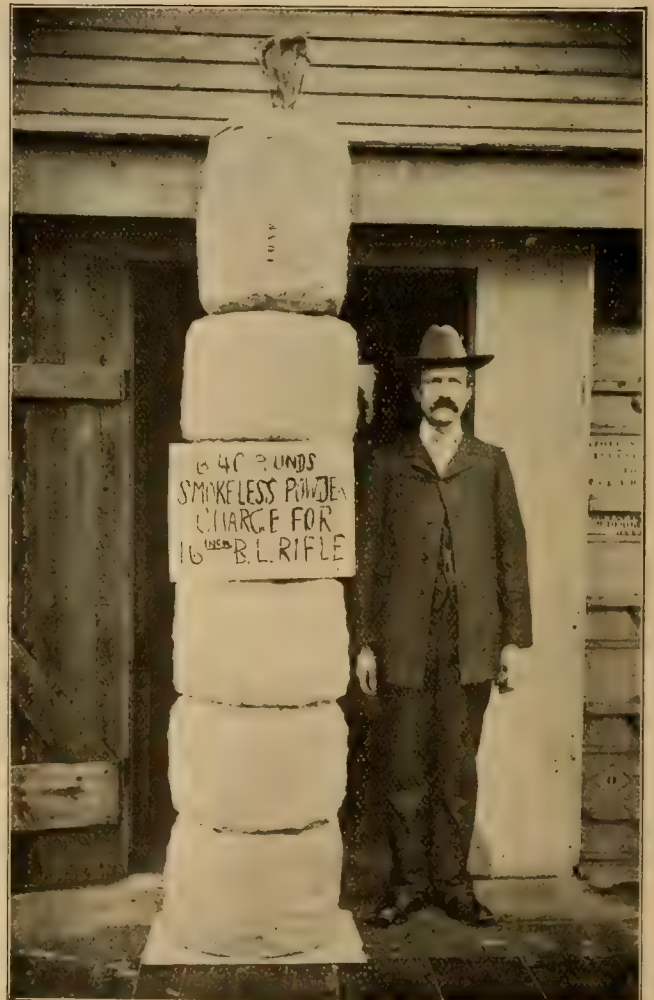

Vessels Built June 1, 1907.

	Battleships.*	Armored Cruisers.	Cruisers.†	Destroyers.	Torpedo Boats.	Submarines.	Coast Defense Vessels.‡
England	52	32	90	142	47	39	0
France	19	19	28	35	257	41	12
United States ...	22	10	41	16	32	12	11
Germany	22	8	38	60	48	1	8
Japan	11	11	19	54	77	7	3
Russia	5	4	15	93	57	25	4
Italy	10	6	11	13	66	3	0
Austria	3	3	5	4	36	0	0

* Battleships, first-class, are those of (about) 10,000 tons or more displacement.

† Includes all unarmored cruising vessels above 1,000 tons displacement.

‡ Includes smaller battleships and monitors. No more vessels of this class are being proposed or built by the great powers.

In England, Germany, and Japan, the battleships and armored cruisers are completed in from two to three years; in the United States, from three to four

years; and in France, Italy, and Russia, not less than four years are required.

It will be seen from the diagram that Great Britain continues to hold her commanding lead among the naval powers, with a total tonnage of 1,633,116, which is two and two-thirds as much as that of the second power, which is the United States with 611,616 tons. France comes third with 609,079 tons, Germany fourth with 529,032 tons, and Japan fifth with 374,701 tons. If all the vessels at present building were completed, France and the United States would change places, the position of the other powers remaining the same. Great Britain would have 1,821,610 tons, France 836,112 tons, the United States 771,758 tons, Germany 680,602 tons, and Japan 451,320 tons.

Modern wars have shown that, in the wear and tear of a bitterly-fought conflict, there is nothing that calls for a larger reserve than the personnel, both officers and men. Hence, the great significance of the comparison of the personnel shown on the ac-

V. Weights and Energy of Cannon.

Caliber of Gun.	Weight of Gun in Tons.	Total Length in Inches.	Approximate Charge of Smokeless Powder.	Weight of Projectile, Pounds.	Muzzle Velocity, Foot-Seconds.	Muzzle Energy, Foot-Tons.	Perforation at 3,000 Yards, Krupp Armor.
3-inch,	1.0	159.35	4	13	2,700	658	1.1
4-inch,	2.9	206.53	12	33	2,800	1,796	2.5
5-inch,	4.8	255.65	20	60	2,700	3,036	3.4
6-inch,	8.6	300.20	38	105	2,800	5,714	5.1

Naval Marksmanship.

If the results recently obtained in target practice by Admiral Evans' flagship, the "Connecticut," may be taken as representing the average skill of the gunners on the sixteen battleships of the Pacific fleet, the

companying diagram. The results are striking, and certainly, for the United States, very disconcerting. Although in the number and displacement of our ships we stand second on the list, in the number of enlisted men we stand last; far below Japan, whose total tonnage is not more than about sixty per cent of our own. With a total tonnage of 611,616 against Japan's tonnage of 374,701, we have only 18 flag officers against Japan's 55; 182 captains and commanders, against Japan's 245; 751 other line officers and engineers, against Japan's 1,751; and 34,062 enlisted men, against Japan's 41,070, Germany's 42,400, France's 51,926, and England's 98,973 enlisted men.

fighting value of the fleet is established beyond all question. Two targets, each measuring 30 feet high by 50 feet long, were used, the fire during the earlier part of the run being directed at the first target, and the later shots being aimed at the second target. The "Connecticut," steaming at 10 knots an hour, opened fire at four and a half miles. She continued firing for eight minutes; and, at the command to cease fire, she was five and a half miles from the second target. In that time she had put through the target four 12-inch, nine 8-inch, and seventeen 7-inch shells. Considering the great range and that the target was only one-eighth as long as a modern battleship, this was phenomenally good shooting.

The Secretary of the Navy has asked Congress to authorize the building of the following war vessels at once.

Number and Class—	Total cost.
Four battleships,	\$38,000,000
Four scout cruisers,	10,000,000
Ten destroyers,	8,500,000
Four submarines,	1,520,000
One ammunition-ship,	1,750,000
One repair-ship,	2,000,000
Two mine laying ships,	500,000
Four fleet colliers,	7,000,000
Totals,	\$69,270,000

The present effectiveness of the principal naval powers of the world is as follows, according to his report:

Nation—	Tonnage.
Great Britain,	1,633,116
United States,	611,616
France,	609,079
Germany,	529,032
Japan,	374,701
Russia,	232,943
Italy,	207,623
Austria,	113,235

But if the warships under construction in these same countries were completed the standing would be:

Nation—	Tonnage.
Great Britain,	1,821,610
France,	836,112
United States,	771,758
Germany,	680,602
Japan,	451,320
Russia,	320,040
Italy,	288,433
Austria,	116,235

Big Additions During Year.

The Secretary then gives the new vessels actually added to the United States navy and assigned to fleets since his last annual report as follows:

Name—	Battleships.	Tons.	Knots.
Georgia,	14,948	19.26	
New Jersey,	14,948	19.18	
Rhode Island,	14,948	19.01	
Virginia,	14,948	19.01	
Connecticut,	16,000	18.78	
Louisiana,	16,000	...	
Kansas,	16,000	18.09	
Minnesota,	16,000	18.85	
Vermont,	16,000	18.33	
	Armored Cruisers.		
Tennessee,	14,500	22.16	
Washington,	14,500	22.27	
St. Louis,	9,700	22.13	
Milwaukee,	9,700	22.22	

CURRENT COMMENTS

PRACTICAL CHARITY.

Many thousands of the needy poor were fed by the Salvation Army in New York and other cities on Thanksgiving day, and Christmas. While the zeal of these charitable workers is to be commended, one cannot but realize how ineffectual are their efforts to relieve the misery of the yearly increasing army of the financially submerged

and the unemployed. This stuffing these poor wretches on two days in the year, while allowing them to starve during the remaining three hundred and sixty-three, is well intended but ineffectual charity, and accomplishes about as much as washing one's face twice a year makes toward personal cleanliness, which latter effort is commendable so far as it goes, but equally unproductive of results.

Real charity does not consist in giving a crust to a hungry beggar, which but alleviates, for the time being, the pangs of hunger and continues him in his dependent state. The only form of charity which accomplishes lasting benefit, is that which furnishes employment for the worker, enabling him to help himself and thus maintain his self-respect. Be it said to the credit of the Salvation Army that they are accomplishing such results in a limited way, with their wood-yards and other industries in some of the larger cities.

How much more potent for the accomplishment of good would be the millions of a Rockefeller or a Carnegie, if, rather than employed in the foundation of libraries and universities for the poor who never patronize them, such wealth were devoted to the establishment of profit-sharing industries for the uplift of the **worthy unemployed**. Such would be practical charity, as every poor wretch thus enabled to assist himself would lessen by one the sum total of human misery, while alms or Christmas dinners bestowed upon the wayside beggar are but palliative at best in their result.

THE POLICY OF THE RUSSIAN GOVERNMENT.

In the Duma's address to the throne the word, "autocrat," as the Czar's title, was omitted through the votes of the Octobrists and Constitutional Democrats. Premier Stolypin's answer to the omission was to take occasion in his ministerial declaration to lay great emphasis on the idea of the autocratic power and unfettered will of the Czar. He denounced the radical parties, whose agitation, he said, had "degenerated into open brigandage." He further declared that the government had decided to make use of all measures possible to strengthen judicial procedure and hasten its operations; and in general gave the Duma to understand that it was expected to carry out the program submitted to it, whether it liked or not. The temper of his address may be judged by his conclusion:

"The historic autocratic power and the unhampered will of the monarch shine out as the dearest possessions of the Russian royal family. Solely by this power and this will, which were created to defend existing institutions, can Russia be saved in an era of danger and demoralization and brought to the path of order and historical truth."

Premier Stolypin's remarks about radical parties were generally understood to imply that the government disapproves of the working alliance between the Octobrists and the Constitutional Democrats. The reactionary Right applauded the address frequently. The Octobrists were cast down by it. In regard to the agrarian problem, the settlement of which is the first need of the country, the Premier recommended the inviolability of private property and the allotment of certain lands to small proprietors. The government program includes the reform of the remstvos (provincial assemblies), the extension of the remstvos system to Poland and other border lands, reforms of the courts, legislation favorable to the Orthodox church and the clergy, and measures for the development of the army and navy. The first business of the Duma will be to consider the budget.

OUR RELATIONS WITH JAPAN.

Mr. Aoki, Japanese Ambassador to the United States, has been rather unceremoniously recalled for some reason. Some interpret the action to reflect Japan's insulted feeling at having one of our fleets visit in her territory. Others say that the recall just now is only a diplomatic blunder. There is no evident alarm over the situation. The feeling between Japan and the United States is not strained half as much as some sensationalists claim. Indeed the two governments are on friendly terms. Japan consented to Uncle's Sam's exclusion act recently and is now asking for a fuller and more definite understanding about emigrating of her subjects to this country. Japan is shrewd and strategic, to be sure, and may cause us trouble some time, but not now. Her resources were

wasted in the war with Russia and besides this, questions of state between us have all been amicably settled. Newspapers have caused all the war rumors of past months.

The latest solution to our difficulty with Japanese emigrants is a proposal to open the Philippines to the surplus population of Japan, and allow free trade between those two countries. Nature has made these people neighbors and Uncle Sam may give his consent for them to become political friends.

LONDON "OUTLOOK" ON THE AMERICAN SITUATION.

"There seems to be no greater American need than the evolution of a higher code of business, financial, and corporate honor. The revelations of the last few years have made it more than ever a grave and vital question whether Americans are morally capable of conducting great business enterprises. That they are technically capable goes for the most part without saying. Where they fail, it is, as a rule, because they have not yet developed an adequate sense of responsibility—of responsibilities, we mean, to the public, to the State, to some ethical standard higher than that of Wall Street and the countinghouse. The insurance scandals were one instance of the length to which their commercialized morality will carry them; the Chicago meat packers supplied another; a third has since then sprung from the always fertile soil of American railway management. The investigators of the Standard Oil Company are at this moment disclosing irregularities and juggleries of a kind that could only be practiced by men who had begun by deliberately excluding the moral sense from their business relations. The inquiry which is now being prosecuted against the operators who have brought one of the richest of the New York traction companies to bankruptcy has revealed an appalling system of organized plunder; and we notice, as a significant fact, that on the very eve of its crash the Knickerbocker Trust Company found it necessary to part company with its president.

"In all these cases, and in many more that might be mentioned, the true source of rottenness has been the dimming of the fiduciary sense—the amazing failure of men, who are strictly honorable in all the private relations of life, to realize that in their public capacity, as the trustees or directors of great commercial and financial corporations, their own private and pecuniary interests should have the last claim upon their consideration. When we see the presidents of insurance companies using the premiums of policy-holders as so many chips in the game of Wall Street finance; railway presidents neglecting the work of railway administration to become gamblers in the stocks of the companies they control; and bank managers employing the deposits of their clients to form political and financial connections for their private profit, we realize how much remains to be done before the standards of personal and corporate honesty in America can be brought to a reasonable approximation."

FINANCIAL IDEAS IN CONGRESS.

Financial legislation bids fair to be a leading feature of the present Congress. Senator Aldrich and Senator Allison have been notified that whatever financial legislation is enacted at this session must originate in the Senate. This is the dictum of Speaker Cannon and Representatives Dalzell and Payne, of the Committee on Rules.

The bill which the House leaders are now considering will provide for the issuance of Treasury certificates based upon securities other than Government bonds deposited with the Secretary of the Treasury.

Senator Hansbrough has introduced his bill to create a central bank of issue. The bill provides for the establishment of the "Central National Bank of the United States," to be located at Chicago, with a capital not to exceed 10 per cent of the aggregate capital of all the national banks, the stocks to be held by national banks and to be non-transferable and non-assignable.

The bank is to be under the direction of a general council of twenty-one members, sixteen of them to be selected by districts organized in proportion to population, one to be chosen at large, and four officers of the Treasury Department to be ex-officio members. The general council each week is to fix the rate of discount for the bank and its branches. National banks subscribing to the

stock may deposit the stock as a part of their legal reserve. Should the maximum amount of stock be subscribed there will be liberated and put into circulation by this provision something like \$90,000,000. National banks may keep one-half of their lawful reserve in the Central Bank, which is forbidden to pay interest except upon Government deposits.

Fifteen members of the general council may authorize the issuance of \$300,000,000 of Central Bank notes, secured by the bills receivable and the bonds owned by the bank. The notes are redeemable on demand in lawful money, and when redeemed shall be destroyed. In case of unusual emergency excess issues of notes, fully covered by gold are permitted. A tax of one-eighth of one per cent per annum shall be paid to the Government on the bank's notes during the time they are in use.

Mr. Roberts recently pointed out that within the last few months we have had the spectacle of the United States Treasury with over \$200,000,000 scattered in 250 banks and the Secretary of the Treasury in need of money and afraid to draw upon the deposits lest he might complicate an already dangerous situation. The whole system, he averred, of wide-spread distribution is impracticable, and a system which subjects the Treasury Department to such importunity and criticism is utterly bad and ought to be abolished.

"One by one every other important commercial nation in the world except the United States has adopted the central bank idea," continued Mr. Roberts, "England, France, Germany, Holland, etc. The Japanese are the most alert, thoroughly up-to-date people in the world. They have made a discriminating study of monetary systems and of administrative methods in every country of the world, and adopted what they concluded the best where they found it. Some thirty-five years ago they adopted a system of national banks modeled after the national banks of the United States, but more recently they have created a central bank, modeled after the Imperial bank of Germany, and turned the function of note issue entirely over to it."

Secretary Cortelyou must furnish the Senate finance committee with full details and information regarding his recent action in taking steps to relieve the monetary crisis.

Senator Aldrich reported from the finance committee a composite resolution covering all the information requested in resolutions heretofore introduced by Senators Clay, Culberson and Tillman, all of which were referred to the committee of which Mr. Aldrich is chairman.

In averting an untimely discussion for the Republicans, Mr. Aldrich promised to secure all the information sought by any senator. This is covered by the following resolution, reported and adopted without debate:

"Resolved, That the Secretary of the Treasury be, and he is hereby, directed to transmit to the Senate the following information:

"1. A statement, giving names and location, classified by states, of all United States depositories, and the amount of public money on deposit daily in each, from Oct. 1, 1907, to Dec. 3, 1907, with amount and character of securities therefor; and an explanation of important changes made in either amount or location of said deposits.

"2. A statement showing in detail the condition of the national banks on Aug. 22, 1907, and Dec. 3, 1907, and the amount of national bank notes outstanding from time to time during such period.

"3. An abstract of the proposals received by the Secretary of the Treasury for the purchase of the Panama bonds and 3 per centum certificates of indebtedness, authorized by the treasury circular of Nov. 18, 1907; the amount of such bonds and certificates issued, to whom awarded, and the reasons for their issues.

"4. A detailed statement of any information he may have as to the amount of clearing house certificates issued by the clearing house associations of the principal cities from Oct. 25, 1907, to Dec. 3, 1907; the character of such certificates, and the purposes for which they were used.

"5. Any information in his possession as to the movement of currency between different sections of the country during the period from Oct. 1, 1907, and Dec. 3, 1907, compared with previous years, and especially of shipments by the treasury, or otherwise, from New York and Washington to points South and West.

"6. A statement showing the amount of gold imports and exports from Oct. 1, 1907, to Dec. 3, 1907."

THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

THE NEXT REFORM.

BOTH the need for, and the methods of temperance reform are settled issues. The churches, railroads, athletes, doctors, explorers, inventors, and every vocation where man's highest skill is required have placed their highest offices in the hands of total abstainers, and have placed such a discount on intemperance that the evil of whiskey is practically settled from a physical and mental standpoint as well as from a moral basis.

The next reform that is needed in the United States is along the line of corrupt literature. It is bad to take rotten whiskey into the stomach, but it is many times worse to fill the mind with licentious thoughts, and thereby poison the soul. Whiskey strikes the body directly and the soul indirectly, while bad literature corrupts the soul directly. A man with infidelic and immoral doctrines is more dangerous to society than the man who debases his body with whiskey.

Mrs. L. H. Harris speaks her mind on bad literature thus in the *Independent*:

"Every novelist should be required to hold a license certifying to the decency of his imagination and to his sense of moral responsibility to society before allowing his books to be sold. Some very distinguished writers of fiction, beyond reproach as to their own characters, are utterly lacking in this kind of integrity. We protect the wrong things, we insure the author's interests with a copyright, and place no tariff at all upon the corruption which his books may contain. It is time to copyright the virtues in our young people at least by protecting them against the bad effects of some popular novels.

"A license is required of every saloonkeeper, yet is there a saloon that is likely to exert a more degrading influence this year than a certain novel mentioned as one of the 'six best selling books' in England? Everybody knows definitely what a saloon is and may

keep out if he chooses, but this novel is heralded in the *London Times*, for example, as a 'dainty romance.' And the author is praised for having surpassed all former achievements in 'poetic sentiment' and 'admirable descriptive power.' A saint might buy it upon such a recommendation. As a matter of fact, 'Sappho' is an innocent pastoral by the side of it, although far superior to it in literary merit. The 'daintiness' of the romance consists in the silk-fine, flesh-colored, skin-tight terms the author uses to present her characters to the reader. The 'poetic sentiment' refers to an exchange of feelings between a married woman, who happens to be an 'Excellency,' and an unmarried man whom she corrupts with that singularly good conscience which a certain class of women maintain at the very nadir of their moral natures. The 'admirable descriptive powers' are employed in the laying of questionable scenes with sumptuous splendor."

An increasing number of ministers are calling attention to the need of suppressing the floods of bad literature being circulated over the country. The postal authorities are working hard to bar questionable books and pamphlets out of the mail, and a number of journalists are saying something along this line, so that we believe the times for a literary reform are in sight.

It would be far more beneficial if the nation would appoint qualified persons to go into publishing houses and book stores and scan the kind of books they have for sale, than it is to have pure food officials to test milk, vinegar, pepper, etc.

This reform may not be very far away either, for some English writers are very much dissatisfied with the grade of literature which some novelists are giving to the public. A literary censorship is already talked of in England and there are those in this country who are ready to advocate the same thing.

A HISTORICAL QUIZ.

1. Who was the first Protestant missionary in India?
2. When and by whom was the Bible first translated into Chinese?
3. Who discovered the Philippine Islands, and who named them?
4. When was the city of Manila captured by the English?
5. What is the oldest institution of learning in the British Empire?
6. When and where did the Cubans make their first declaration of independence?
7. When, where and by whom was the British ship "Victoria" sunk?
8. When was the battle of Shipka Pass fought?
9. What navigators first reached Australia?
10. Whom did Napoleon defeat at Austerlitz?

11. When was Queen Victoria named Empress of India?

12. How was the independence of Switzerland guaranteed?

13. Who founded Cape Town, and when?

14. When did Mexico become independent of Spain?

15. Who discovered and named Cape of Good Hope?

Do not send any answers to the Editor.

WHERE IS THE REAL POWER?

Congressman W. Bourke Cockran, of New York, recently said: "During the last ten years, the entire control of productive agencies has passed into the hands of less than half a dozen men. Frankly, if you ask me to give the names of those who completely dominate the entire industrial field, I could not mention more than four to save my life. I am quite satisfied that you will all realize that their combination is stronger than any government that ever existed.

"I think we will take the names of Rockefeller, Morgan, Harriman and Hill, and for a fifth we will say Armour, and you have all that practically control the important industries and agencies of transportation. By the influence which this control gives them they have come to dominate our financial institutions, our great insurance companies, our leading banks and trust companies. What then does it signify that they control not merely the agencies of production and exchange, but they control the agencies of credit, that means the entire industrial life of a community.

"In the last twenty years I do not think a single act has passed Congress which had its origin within limits; every one was imposed upon it from outside. I do not know of an important bill that has passed Congress except under the whip and spur of Executive influence.

"If you want to strike an illustration of how absolutely contemptible the legislative power has become you have to consider the recent events in our own State. You remember the two-cent rate law passed last winter that was vetoed by Gov. Hughes. Has he any right to veto any measure? Do you remember his ground for his veto? He vetoed it on the ground that the members of the legislature did not possess sufficient information to legislate upon the subject intelligently. That, I believe, is a fair statement of that veto message. I am quite sure that Gov. Hughes would not dispute the accuracy of it. He said they had no inquiry, and therefore they did not possess the necessary information to exercise that power conferred upon them effectively or even intelligently."

In speaking of the putative powers of the National Government as compared to what Mr. Cockran styled the "real government," he cited the recent financial panic and said this peril was the greatest that had ever faced the country and had been dealt with, not by agents of the Government, but by forces outside. The eyes of the country, he said, had not been turned upon the Executive at Washington for relief, but to the library of a prominent citizen in New York, where a secret conclave was held. The result of this conclave, he said, was the adoption of measures upon which the whole country is now stalling its financial policy.

"It is a portentous fact," resumed Mr. Cockran, "that the greatest problem which has risen in this country in recent years has been treated not by an agency of the Government, but by an individual whose identity is unknown. This certainly indicates a profound revolution in our political system."

EXECUTIVE'S VIEWS ON LEGISLATION.

President Roosevelt was called to task by the Senate because of the action of the members of his Cabinet in sending recommendations direct to Congress without having them go through the regular channel. In the future the Senate will force the President to approve or disapprove over his own signature all legislation recommended by his official advisers. One of the hardest blows against so-called "executive usurpation" was struck when

Senator Aldrich, the leader of the Senate, had all the communications from the executive branch of the government referred to the rules committee to be scrutinized before any action is taken on them.

A resolution also will be adopted requiring the President to personally supervise all the proposed legislation. This will curtail his action, as in the future he will be compelled to show his hand. In the past many recommendations have been sent to Congress which were favored by the President, but to which he did not commit himself.

FAVORS POSTAL SAVINGS BANKS.

The Postmaster-General recently said: "I am heartily in favor of the establishment of postal savings banks, and will urge upon Congress the enactment of such laws as will enable the people to turn over to the government for safe keeping their savings. I know there is opposition in certain quarters to the proposition, but I do not expect it to encounter as much as my other suggestion for the improvement of our parcels post system. I am looking to the West for sterling support in both.

"When the question is viewed calmly there is not much in it to excite opposition. My plan is to allow interest upon all deposits, say at the rate of two per cent per annum. Private savings banks offering three and four per cent interest on deposits cannot, with reason, object to this lower rate.

"What we want now is to secure the passage of a law which will launch here a system that has been conducted with so much success abroad. Whether a special issue of stamps should be provided to be sold the public to be placed in books to be issued by postal savings banks is another question which can well be disposed of when the law is being framed. My idea is that it might be stipulated that amounts from twenty-five cents upward should be accepted by postmasters, and that no account should be permitted to exceed \$250. I think it well to place a maximum upon the total of the savings to be cared for by the government. After the depositor has accumulated \$250 or \$300 the savings habit will be upon him and he can then be prevailed upon to withdraw the amount for deposit in some private or national institution and begin again with his small savings."

EXPRESS COMPANIES AND LIQUOR.

Senator Tillman has introduced in the Senate the following resolution:

"That the committee on interstate commerce be instructed to consider and report, by bill or otherwise, what legislation is desirable or necessary to enable the states, in the exercise of their police powers, to control the commerce of liquors and all alcoholic beverages within their borders, so as to aid the cause of temperance and to prevent the encouragement by the United States government of illicit dealing in the same."

Mr. Tillman holds the express companies responsible for the evasion of the state laws regarding whiskey. He says they are flooding the local option part of South Carolina and other local option Southern states with whiskey which is sent in from other states "C. O. D." The Supreme Court of the United States has held that such traffic cannot be interfered with because of its interstate character.

Senator Knox considered it unfortunate that the decision of the Supreme Court of the United States had maintained that the "arrival" of the goods should make their delivery to the consignee.

The resolution was referred to the committee on judiciary.

OKLAHOMA'S ADVANCED IDEAS.

1. Strict Prohibition; 560 saloons quit business when the last hour was up.

2. Curbing of Corporation corruption. Waters-Pierce Oil Co. was prohibited from piping oil out of state to other refineries.

3. Mutual State Banks. The stability of one state bank is guaranteed by all the state banks.

Oklahoma has made a remarkable record in her constitutional ideals.

My Boy's Treat

Adaline Hohf Beery

Down the long avenue whistles my boy,—
Mother's own confidant, helper, and joy;
Bundle of cheerfulness, honor, and grit,
Soul for promotion and leadership fit.

Dim in perspective, my boy waves good-bye;
All day I'm seeing the laugh in his eye;
Toil I can bear, and the clock chirps away,
White wings come down through the lone time to stay.

* * * * *

How could I tell what might happen by noon?
How could the dagger be whetted so soon?
Coaxed round the corner, to ruin next door,
Clinched is my boy by iniquity hoar!

Fun-loving fellows just offered him drink;
"Come, Jack, we'll pay for it, quick as a wink!"
Smiling and beckoning in the bright glass,
Red wine has conquered my darling, alas!

Weak, trembling target for joke and hurrah,
How rough the current, just turned by a straw!
Flushed and abashed when the night brings him back,
Never the same soul of virtue, my Jack!

Curse on the demon who over him gloats,
Set on a throne by American votes!
If at the judgment my boy should be lost,
The open saloon shall be charged with his cost!
Huntingdon, Pa.

Special Medical Advice Concerning The Baby

Dr. B.

[About twenty articles on Health for the Home follow this present article.]

NATURE has constituted the baby to be a government unto itself, whose ways can be known only by the personal study of each little individual. They are a vital bunch of soft and elastic probabilities, whose early care is just as important for their future as is their minute and delicate construction.

Much could be said for the benefit of the baby, but in this article remarks will be limited to the early feeding of the infant.

It is a mistake to feed the baby solid food too young. Soon after birth the stomach is almost vertical and is but a little more than the expansion of the bowel. The muscular construction is very weak and the digestive power is yet incomplete. There is an absence of saliva during the first months to say nothing of the lack of teeth, and of certain glands of the intestines which are yet undeveloped.

The stomach capacity of an infant at birth is from two to two and a half tablespoonfuls; at one month of age it is about four tablespoonfuls, and at three months of age about four times the size at birth, or four and a half ounces.

From this age the stomach grows in size at a much slower rate of development.

From the first week an infant should be given small quantities of water daily, which will add to its comfort and strength, and will also avoid constipation. Their feeding must be adapted to each individual child, but in all cases their food should create comfort and growth. Should there be any vomiting or colicky pains, together with mucus or green stools, the food is either given in too great quantities, taken too rapidly, or the food is of inferior quality not adapted to the child. Such conditions should be corrected or digestive disturbances and malnutrition will follow. When the child is properly nourished its growth will be from six to eight ounces per week, and when there is no reasonable increase in growth the condition demands proper study and correction.

The best nourishment is that provided by nature, and the best artificial food is cow's milk. Always secure milk from the same cow, well observing all sanitary conditions, and in the hot summer months know that the cow is nourished on dry feed.

Cow's milk should be given raw, that is, not heat the milk to more than a temperature of one hundred degrees F., and should either be weakened with water, or given full strength according to the strength of the child.

It is a known fact that the prolonged use of sterilized cow's milk will bring on scurvy, and to avoid this the milk should be given as above directed. During the wakeful hours of an infant they should not receive nourishment closer than every two hours, and in health they should sleep from four to eight hours at a time.

The child's stools should be from two to three in twenty-four hours, and if constipated one teaspoonful of glycerine and same quantity of warm water mixed together, placed in a small glass or hard rubber nozzle and flushed into the bowels will give immediate temporary relief.

When there is sour vomiting after feeding, first reduce the quantity of food and add a little lime water, and also, when the stool is green reduce the quantity and add a little water and the white of one egg with a very little salt for one or two feedings a day.

The feeding of a child is its sole comfort, and every care should be observed in artificial foods, as many thousands of little lives are extinguished simply from improper feeding and nourishment.

RAGS AND RICHES RUB ELBOWS IN DAILY LIFE.

RICHARD SEIDEL.

NEW YORK is a city of human contrasts, where the extremes of life rub elbows and where there are to be seen impressive pictures that combine the high lights of a Turner and the deep shadows of a Rembrandt. These pictures are flashed daily on the watchful eye of the careful observer, and are full of deep human interest to the thoughtful man. Here are four seen in one day early last week:

There stood at the window of a Thirty-fourth Street dry goods store a woman, with a small dirty shawl for a head covering and wearing a soiled, ragged calico dress that was rather low on the top and short in the skirt, showing a thin, wrinkled, corded neck, and feet in torn runover shoes that were not mates. She was an incarnation of poverty as she stood with clasped hands, looking into the window at a woman's gown made of rich material and trimmed with costly lace.

Another woman dismounted from a carriage at the curb as her driver restrained two prancing horses. Her footman assisted her from the door, holding her velvet skirt so that it might not touch the wheel, steps or pavement, then he stood at respectful attention as she entered the store, almost touching the other woman. Her feet were incased in low patent leather shoes that showed the open work of silk stockings and where her dress dropped at the neck there was to be seen a wealth of jewels.

Another picture of human interest whose figures were children just entering the path that promised to lead to the scene of the other was observed in Fifty-

seventh Street. A little boy, with bare feet, had turned from Second Avenue and had gone nearly to Fifth Avenue, drawing an improvised cart made of a box and supported on two wheels of a baby carriage in which was seated a dirty-faced girl of about ten years old, who had neglected to put a dress waist above her skirt. As a large, red automobile drew up to the sidewalk and its chauffeur got out the cart stopped, and while the boy was looking at the machine, the girl's attention was on a little miss about her age coming from a house and dressed in a short flaring pink silk frock with stockings to match. She was carrying a miniature parasol of lace. The chauffeur helped the dainty girl into the automobile and, taking his seat rushed away while the other two proceeded on their slow pace with eyes on the departing machine, as long as it was in sight.

There was another sort of picture seen down in Worth Street. As a policeman picked his way through a mass of dry goods boxes that made the sidewalk almost useless as a thoroughfare, in front of the great stores that represent millions of dollars in capital, he pushed from the corner a Greek peddler who with a stock of fruit worth three or four dollars, was offering his wares for sale.

"Move on out of this," said the policeman, "and do not be blocking the street." The peddler obeyed in silence and as he did so was nearly run down by a swift moving automobile that went at a speed beyond the legal limit. The policeman saluted the occupant of the machine, who perhaps was a member of the city street-cleaning department.

Last of the pictures in this little gallery of four was one seen at midnight in front of a fashionable restaurant in Fifth Avenue, where shaded candles on linen cloths made bright with silver brought out a scene of festivity that could be viewed below the fringed curtains. Standing looking below this fringe was a ragged beggar, a man as forlorn as a mortal could be in appearance, who apparently all the evening through had been unsuccessfully soliciting alms with which to buy himself food and a place to sleep.

WHEN THE ROBIN SANG ALL DAY.

. MARVIN MANOM SHERRICK.

There must have been three little birds all new,
Or four, now who can say?
In the cosy nest on the poplar tree,
When Robin sang all day.

There must have been love in the poplar tree
Where Mistress Bird dreamed away;
But with eyes awake, and wings outspread,
While Robin sang all day.

I know that the sunshine was bright and fair
And found in one heart its way;
For the tune in the heart was the robin's tune,
And the Robin sang all day.

Mt. Morris, Illinois.

Some Cuban Fruits

Grant Mahan

Of course oranges, lemons, grape fruit, pineapples, cocoanuts and bananas grow here; and they certainly are very good. And then there are other fruits, such as we knew nothing about in the homeland. Some of them we like, and some of them we have not yet learned to like; but they say we will like them all in time.

One of the fruits to which we did not take at all is the mango. The season for it was about over when we came, and we had not time to learn to like it—and I am inclined to think I never shall. First of all, the taste of it is not pleasant to me; secondly, the seed is large and the meat is bound to it by fibers which are quite troublesome when one is eating the fruit. But some families eat two or three bushels a week during the season. If we are ever here during a whole season we shall be better able to tell about learning to like the fruit. Though originally introduced here, the mango tree grows practically wild in Cuba. In shape it is one of the most beautiful trees we have, reminding me, in its symmetrical growth, more of the hard maple in the States than any other tree. It is very prolific and if not cut back will grow to be fifty or sixty feet in height.

The aguacate is another fruit new to us. We had

A Bunch of Mangoes.
Courtesy of the Cuban Review and Bulletin,
New York City.

our introduction to it in the hotel at Havana. After supper a gentleman said when fixed up it is delicious; and we immediately wished to know how to fix it. And it must be said that what we were inclined to dislike is now eaten with relish. One must taste this and other fruits to know what they are like, for the taste cannot well be described.

The guanabana, or sour-sop, is not a native of the island, but is said to respond to proper handling as quickly as any of the native fruits. The guanabana makes delicious ices. It often grows to large size and is of a very delicate flavor. It is difficult to ship, but will surely always be an important fruit in the home market.

The mamoncilla is sometimes called the Cuban grape, as it bears a close resemblance. The pulp is acid sweet incased in a thin shell. These seeds are a solid white meat, and are often eaten after being roasted like chestnuts. Selection and cultivation will no doubt make this a most desirable fruit.

There are many more fruits growing here than one would undertake to enumerate and describe. It is said that there are about a hundred and sixty of them. Whether any one man is familiar with all of them is more than I can tell. We know but a few of them,

Harvest Home with Pineapples.
Courtesy of the Cuban Review and Bulletin, New York City.

and of four or five of these a little will be said. One wishing to know more about the fruits will do well to investigate for himself.

The anon, or custard apple, is called the queen of Cuban fruits. The picture gives a very good idea of its appearance, except that it is larger than one might suppose, its size being more like that of the apple than of the berry which it somewhat resembles. Its color is a pear green with white markings, and when ripe it is of a pinkish tint in the creases. Even a newcomer does not find it hard to like this fruit.

Lime trees are found all through the woods in our section of Cuba. Usually they are small but sometimes almost as large as lemons. The trees bear well, and the fruit is said to be much better than the lemon, for shipping. Cubans bring limes to your

house for five cents a dozen, or three dozen for ten cents. The trees are transplanted by many persons. This is about the only way to save them, for when the timber is cut and burned—which must be done before the ground is ready for planting—the trees would be destroyed if left standing. We hope to have some of them for ourselves.

Then there are the pineapples. Many are grown now, but a great many more will be in the next few years, for almost everybody is setting out plants, which come into bearing in about a year and a half. It is with the pineapples as with most other fruits, one gets the best where it is grown. And then there is a great deal of satisfaction in gathering the fruit for oneself. But of course it is better to have fruit which you like after it has been shipped a long distance than not to have it at all.

A Bunch of Limes from a Native Tree.

Grape Fruit Ready for Packing. The Basket Shows the Size.
Courtesy of the Cuban Review and Bulletin, New York City.

And the cocoanut palm is found all along the line. Not many of them, comparatively, are allowed to ripen: they are picked green, cut open, and the milk taken out, then the shells are thrown away. When cold and sweetened this milk is very good. We do not get that kind in the States. We have some trees growing, and if we are here, or make another visit we hope to enjoy the fruit of them.

It would be interesting to have pictures and give descriptions of some of the fruits peculiar to Cuba, which are not known in the home-land; but we do not have the pictures at hand, and so have said little about any but the more common fruits. As time passes we hope to have several of the most desirable of Cuban fruits grown on our little place; and if our friends from the north want to get away from frost and snow and ice for a winter, we shall be glad to share with them when we are here. We find it difficult to realize that it is midwinter, for every day we have fresh vegetables from the garden and fresh fruit from the trees but of course not everything is as we should like to have it. The good things are told; the bad we are allowed to find out for ourselves. Maybe this is because people like to talk about good rather than the bad.

Omaja, Cuba.

THE ABSENT-MINDED HUSBAND.

IDA DONNALLY PETERS.

MARGERY sighed unconsciously as she slowly made her way from the small rustic station toward her old home. The country through which she was passing was the same she had gone over, a happy bride, a few short months before; then a roseate hue seemed to cover the wind-swept ridges, and the limbs of the bare trees stretched out over the blissful pair as if in a sweet, solemn benediction; now these same ridges were grass covered and the trees were clothed with beautiful foliage, yet, to Margery, despite the sunshine of the early June morning, there was a dull, leaden hue over everything.

At the top of the hill which looked down upon her old home she paused, and the influence of the familiar

scene and the sights and sounds of the early summer morning, together with the sure knowledge of the hearty welcome awaiting her, considerably lightened her heavy heart, and, when a gay, joyous voice shouting, "Katherine, Katherine, as I live there stands Margery!" broke the stillness of the quiet country morning, only a close observer could detect anything unusual in the expression of her face.

"What a happy thought to surprise us!" cried Betty Gladden breathlessly, as she hurried up the hill and into Margery's arms.

The Anon or Custard Apple.

Courtesy of the Cuban Review and Bulletin, New York City.

"Why didn't you let us know you were coming?" continued Betty as she made way for Katherine who held her young sister close and looked deep into her brown eyes, where it was plain to her keen, sisterly regard there dwelt a slight shadow.

"Where is John? Isn't he coming?" asked Betty, whose nimble tongue was never long silent.

"No, John is not coming, he is too busy at home: I ran over to spend only a few days and to see what you girls were doing," answered Margery.

"I am very, very glad that you came, Margery dear, in fact there was never a sight so welcome to cousinly eyes, as you are to me on this occasion," said Betty as they sauntered down the hill. "Your coming always fills us with joy, but today you bring hope as well, for you come in time to aid the almost vanquished."

"For heaven sake, Betty, do not begin that nonsense again. It doesn't sound well at all," admonished

Katherine, as they seated themselves on the steps of the porch.

"Why so much mystery? Have you added another to the victims of your merciless toils, oh, faithless Betty?" asked Margery.

"Alas, no, there is no question of a victim, Margery dear," declared Betty. "But if you have tears prepare to shed them now, for this is a tale that will wring your tender heart. See yon bungalow, perched beside the lake and flooded in sunshine! In that bungalow dwells a man, young, handsome, rich, eligible, yet carrying within his breast a marble heart."

"Can it be! A man to resist the charms of the redoubtable Betty! But methinks," continued Margery, "that the silent Katherine should be heard upon the subject. Have you anything to say in excuse for this recalcitrant knight, oh, defender of the absent?"

"Betty has some sort of an absurd bet with Herbert that she will meet this Mr. St. Claire; and Margery, I wish you would dissuade her from it. He, like your husband, is a scientist and does not want to be bothered by silly girls."

Katherine arose. "Margery, you shall have your favorite berry roll for luncheon," she said as she disappeared within the house.

"Is it true, is it really, really true that a young and handsome man has lived next door to Betty Gladden for weeks and weeks, and is yet without consciousness of her existence? Oh, what a falling off is here!" sighed Margery.

"Now, Margery, don't tease. It means more to me than you and Katherine think. Suppose Herbert should find out that any man can resist my well-known charms. It would be enough to make him forswear his allegiance forever. Besides I must win that bet."

"I have a suspicion that the bet is at the root of the matter," said Margery.

"At any rate I must meet him and you must help me to do so," answered Betty.

"I help you, what do you mean, Betty Gladden!" exclaimed Margery.

"I mean simply this, that you must help me, and you will, too, as soon as you hear my beautiful plan." And with many a glance around to see if Katherine, the careful, were within hearing, Betty in excited whispers unfolded her scheme.

"That is easy enough to do, Betty dear, but why not take the leading part yourself?" asked Margery.

"I should love to do it, but if he recognizes me as his frivolous neighbor, I am afraid he would see through the trick," answered Betty.

"I shall do as you wish, but I assure you that the plan will fail," said Margery.

A couple of hours after luncheon Margery slipped out of the house unobserved, and made her way to the

lake. Seated there alone with bowed head, and occasionally pressing her handkerchief to her eyes, she presented a very mournful picture. The plan was that she should keep this pose until the unimpressible St. Claire saw her, and was moved by her distress to come and offer her his assistance, when she was to be reading a sorrowful story which was to account for her emotions. Explanations and apologies would ensue, of course, an acquaintance would be begun which was all that was necessary, according to Betty's opinion, to give Mr. St. Claire a desire to become all that she wished—a pleasant summer friend.

After a few moments Margery became engrossed in her own thoughts and forgot all about the cherished plot.

She was the six months bride of a man, who, though a devoted husband, was also an enthusiastic scientist. He had gained his wife, she was already his, but science, his mistress, was unattained and was wooed with unfailing ardor. And poor Margery, who, before her marriage, was the center of the life and gayety of the town in which she lived, now sat alone evening after evening looking from the window into the streets at the happy crowds passing to and fro. But the summit of her disappointment was reached the evening before.

That day had been her birthday and she had ordered a delicious dinner and had planned that they should spend a happy evening together. That afternoon Moreland attended a meeting of scientists, after which he and his friend, St. Claire, went to a near-by laboratory where some experiments were tried which lasted until after midnight. Moreland forgot his engagement with his wife, and in fact his wife herself until next morning when he found a pathetic little note on his plate, which read:

"I am lonely, and shall leave this morning for a little visit to father and Katherine.

"Affectionately,

"Margery."

Then he remembered the engagement for her birthday and, to his credit be it said, felt heartily ashamed of himself. He hurried to the station to take the first train for Pelham, and there found St. Claire who was also bound for the same quiet little village.

When the two men came in sight of Margery she was sitting by the lake feeling very forlorn indeed and her drooping figure looked very pathetic.

"Isn't that a girl sitting there? She seems to be in trouble," added Moreland as they came in sight of the weeping woman.

"Good heavens, is she going to drown herself?" exclaimed St. Claire.

Margery had arisen and was walking toward the lake slowly, it is true, but with purpose expressed in every line of her graceful figure.

"My God, it is Margery!" And away flew More-

land, plunging headlong through the hedges and scrambling over stones and through brambles, across a field which was the nearest way to the lake. He was all unconscious of losing his hat, tearing his hands, face and clothing, for love and fear lent wings to this stiff-jointed scientist; and too, then and there, he began to realize that with Margery gone life would be empty indeed, and even his beloved science would have no further charms for him.

Margery had reached that deep, dark, sinister looking pool and kneeling beside it paused a moment, then with hands outstretched she leaned over it, when Moreland with a last desperate sprint reached her side just in time to prevent her—bathing her eyes in its cooling waters.

SHREWS AND MOLES.

JOHN H. NOWLAN.

Not all of our insect foes are to be found in the air or on the surface of the ground. Many of them spend at least a part of their time beneath the surface of the earth where they are safe from birds or their insect foes.

Here comes in another of man's allies in the form of a small grub-eating mammal. The shrew is the smallest mammal known, being smaller than the mouse. By some it is mistaken for a young mole, but the front feet of a mole are broad, even in babyhood, while the shrew has feet similar to those of a mouse. Its fur is soft and fine, but it has well developed eyes and lives above ground. With its long flexible nose it roots in the ground and searches in the grass for grubs.

Dogs and rats sometimes kill them mistaking them for mice, but do not eat them because of the disagree-

able odor. And he dies game. The only thing that prevents him being a formidable antagonist is his size, or rather lack of size.

The Shrew.

When frightened he voluntarily emits the odor, which, though disagreeable, is not nauseating like that of the skunk.

His home is in a hollow tree, under a root, or in a hole in a bank. Here he makes a soft nest of grass and rears his little family.

As to his neighbor and co-laborer, the mole, I cannot speak with such positive assurance. He cannot see, and his hearing is imperfect, but his sense of touch and smell are wonderful.

Place one on the ground and he at once begins to dig, and in a minute may be out of sight.

His keen nose scents the grubs and his flexible

tongue does not let them escape. His fur is erect, so it always "lays" well, no matter in what direction it is stroked. This enables him to keep his coat clean while passing through his burrows.

His digestion is very rapid and he will starve if deprived of food for twenty-four hours.

In hunting for grubs he sometimes takes the grain also, and often leaves the soil around the roots of the grass and vegetables so loose that the dry weather kills them. Naturalists say he is beneficial and they may be correct, but many people think otherwise.

Mulberry Grove, Ill.

THE OLD YEAR.

RICHARD SEIDEL.

Now the dear Old Year is ended,
Joy and sorrow both have blended
In its passing days.
And 'twas best so, both were given
By our Father, wise, in heaven;
Render we sweet praise.

Backward as the leaves we're turning,
Precious lessons we are learning,
Ne'er to be forgotten.
Here are words unkindly spoken
There are obligations broken,
All for want of thought.

Sad the hours we thus have squandered,
As from duty we have wandered,
In forbidden ways.
Yet the heavens bear us witness,
How we've yearned for angel fitness,
'Mid these trying days.

Yearned for faith that is abiding;
For a trust always confiding,
In our God above,
Who will give when earth shall fail us,
And when inward foes assail us,
His protecting love.

Gracious Father, we surrender
All to thee, our sure defender,
Whatsoever betide.
Where thou leadest we will follow,
Each today and each tomorrow,
And thy wisdom bide.

Cover in thy loving kindness
Missteps taken in our blindness;
Often do we stray.
Yet we seek thy kingdom, holy,
Though we make the journey slowly,
Lengthen out our day.

Counting up our gains and losses,
Merged in love are all the crosses,
Of the good Old Year.
Canceling all claims and debts,
As friends, we part without regret,
Faithful, good Old Year.

CREAM OF MAGAZINES

PARCELS POST.

If there is anything indicative in what the press and common people of the country are saying the 60th congress will have to consider very carefully before it absolutely refuses the recommendations of Postmaster-General Meyer that a parcels post be established in the United States, the limit in weight to be 11 pounds to the package and the rate to be 12 cents a pound. With a large part of the people the plan is a popular one, for it would mean much less expense in shipping parcels than is now met with when those parcels must go by express.

To a limited extent we already have a parcels post between the states, but the trouble with it is that the rate is 16 cents a pound and the limit four pounds; whereas by the parcels post which we have established with certain other countries 11 pounds can be sent at the rate of 12 cents a pound. The situation has been clearly pointed out by the postmaster-general who says: "Any individual entering the postoffice in Boston or any other city or town in the country, with two parcels, each weighing four pounds, can send one parcel to New York for 64 cents, while for the other parcel, which is addressed to someone in a foreign land and goes via New York, he will have to pay but 48 cents for the reason that the rate to foreign countries is 12 cents a pound, while the rate to our own people is 16 cents a pound. Should the packages weigh four and one-half pounds each, the one addressed to the friend in New York would have to be refused by the postmaster, while the one addressed to the person in a foreign land and which would be accepted would be forwarded to New York and then on to its destination. The parcel for the foreign country would be received in most instances even if it weighed as much as 11 pounds and forwarded to any one of 22 foreign countries."

Two interests oppose the parcels post,—the express companies and the country retail merchants; the first know that they will have to bring their high rates down to meet the federal competitor, and the second fear that the mail-order houses will get their trade. The postmaster-general has a plan to help the country merchants. "If my recommendations are adopted," he says, "it will cost 12 cents a pound for the mail-order house to send parcels to the rural delivery patron from any city postoffice while for delivery to a patron from the distributing office of the rural route, or if mailed by a patron of any route for delivery to a patron on the same route or at the distributing postoffice of said route, the charge will be but five cents for the first pound and two cents for each additional pound up to 11 pounds, or 25 cents for a package weighing 11 pounds."

The European countries have long been using the parcels post to advantage. In England an 11-pound parcel is carried for 22 cents. So prompt is the government in handling the parcels that the retail houses and laundries in the cities find it cheaper to deliver by parcels post than by delivery wagon. By paying a small fee extra immediate delivery is secured, as the special delivery of a letter is secured in this country. Besides this, up to a certain amount, practically all the goods sent by parcels post are insured. In Germany an 11-pound parcel can be sent for 12 cents and those weighing as much as 110 pounds may be sent for a little over 60 cents. Even such things as trees are sent by parcels post over there.—Pathfinder.

SOUL-MEASURING MACHINES.

Suppose for a moment that you were a criminal, had committed some heinous crime, but had so carefully covered up your tracks that, despite the fact that you were suspected, you felt sure the law could not fasten the guilt upon you; then suppose you sat in a prison cell with an officer who fired a battery of words or questions at you

and you knew that a few doors away in a room as dark as a bottomless pit a jury was sitting watching a thin thread of light which, like a ghost from the other world, was telling on a graduated scale exactly what your emotions with regard to this terrible secret were. It would be worse than in the days of the Spanish inquisition, wouldn't it? You would dread it more than you would the thumb-screws, the wheel, or the rack.

Well, let's take it for granted that you never are going to be a criminal and will thus be spared such torture; but it is a fact that some day such a mechanism may be employed in criminal cases. The instrument is the invention of an American and a Swiss scientist and is called the psychometer, a word which is derived from two Greek words and means "soul-measurer"; it measures the emotions of the soul; tells whether certain suggestions excite the soul or not. Now technical explanations are always tiresome, but that you may understand this wonderful machine let us as briefly as possible take a look at it and then pass on to the eerie results that come from its operations. Suppose we step into the scientist's office in New York where the psychometer is kept. There it is on that table over there. It has two parts; the first of which looks very much like an ordinary galvanic battery; it is here that the electric current is generated. The second part is the one that does the mysterious work. It is simple, though, being merely a galvanic mirror with a thin thread of light thrown upon it and this thread of light reflected upon a scale that looks something like a foot rule in its graduations. The first and second parts are connected with wires; the current is on, and if you take the two poles of the battery in your hands you will get a demonstration of the psychometer. The room is darkened so you can see the thread of light reflected upon the scale; it is resting at the zero mark. Now let us suppose that you were recently in a train wreck and barely escaped being killed. A friend mentions a number of words which call up ideas in your mind and you watch that mysterious little thread of light upon the scale. Your friend mentions "water," "food," etc., but the light remains stationary or moves very little; but unexpectedly he says "railroad." Instantly the thread of light goes dancing up the scale. You have thought of the wreck, your emotions of fear were aroused and the light indicated it. Further than this, a little device, called a "kymograph," had been tracing a line on a strip of paper all this time; the line ran along straight until "railroad" was mentioned, and then it began to go up and down. There is a written record of your emotions.

Of course you know the principle of the galvanometer—the mirror vacillates in proportion as the electrical current in the battery increases or diminishes. In the present case the current passes from the battery through you to the galvanic mirror, and if anything happens within you to check or facilitate the flow of electricity, the result is projected on the scale and recorded on the strip of paper. "But," you say, "how can an emotion, which is psychical affect an electric current?" The "why" of the matter remains yet to be fully and incontrovertibly explained. The scientists who are at work on the psychometer say that the most probable theory is that the cause is due to a variation in resistance to the electric current depending upon changes in the amount of secretion in the sweat glands. They deem that our emotions are carried from the soul to the skin—by the nerves perhaps—and there cause such minute changes that only a delicate instrument can indicate them. The skin's condition governs the degree of resistance to the current; changes of resistance are recorded by the mirror and the pencil.

Some very interesting experiments have been performed by the scientists, and in each case the result was the same. The emotion aroused caused a deflection in the ray of light and produced a wavy line upon the strip of paper. One of the experiments performed will suffice. They got

hold of a man who had tried to commit suicide, but who had no idea that the scientists knew of it. Test words to suit his case were given. The majority of words used had no significance whatever, but here and there a word was used which, it was thought, would suggest his attempt at suicide, which was by drowning. The man was asked to tell the scientists what was the first thought that came into his mind after hearing some word which they would pronounce. "Head" was the first, and immediately the man replied "hair," a very natural suggestion. "Green" suggested "meadow"; "stick" suggested "knife." All this time the answers were made unhesitatingly and the thread of light remained stationary. But when "water" was given, the thread of light leaped above the zero and kept jumping up and down. Five seconds elapsed before any reply came and then the man said "deep." He seemed to have thought of his desperate undertaking. The light grew steady again and insignificant words were given, with no effect. But "ship" and "lake" produced more waverings of the light and the replies did not come so quickly.

It is thought by some scientists that the psychometer may come to be used in criminal cases. If necessary, the criminal could be in one room holding the electrodes and the indicator could be in another. A good deal is staked on the fact that emotions cannot be stimulated as an act or thought. One way to confuse the inquisitors, however, would seem to be for the criminal, realizing that he was being tested, voluntarily to think of something that would arouse his emotions at the time when an insignificant word was put to him. Whether or not the psychometer will ever be of more practical use remains for the future to say. At any rate it is a most interesting invention, if only from a scientific point of view.—Pathfinder.

HOW GERMANY MAKES THE WORLD'S TOYS.

The doll-manufacturing industry did not begin to assume conspicuous proportions until 1850. Before that time only wood and leather were used in this trade. At the time of the first London World's Fair a Sonneberg doll manufacturer brought home and improved a Chinese doll, made of heavy colored paper, and with movable head and limbs. Next came hairless wax heads. To begin with, the wax and varnish were put on the prepared head with a brush in a more or less crude or uneven manner, whereby the face was left expressionless. A thimble, so the story goes, one day fell into a dish of fluid wax. When its owner drew it forth it was found to be beautifully covered with a uniform coating of wax. The manufacturer caught the idea and established a factory for wax papier-maché dolls prepared by the dipping process. By giving the papier-maché a flesh tint and through the use of wheat powder, he attained a very good imitation of the human skin. Painting completed the process of facial expression. Next came the setting of artificial eyes, which are principally made in the little town of Laucha. These eyes soon were made movable, and the result was a sleeping doll. But the hairless head had to be improved. Human hair was originally used, but the discovery of mohair wigs opened up large possibilities in this line, as the fine, glossy hair of the Angora goat was found to be unsurpassable for this purpose. When mohair grew more expensive wool was added. In rapid succession there followed further inventions and discoveries until the modern, life-like, jointed, speaking doll was the result.

At the head of this industry are the large exporting houses, both German and foreign, doing business directly with merchants in all quarters of the globe. They correspond in all modern languages, and are organized on the most approved, modern style. Some of them do a commission business almost exclusively, gathering up the toys in small lots, packing and shipping them, and doing little or no manufacturing business themselves.

Next in rank are found smaller exporters and manufacturers doing some foreign business directly, and delivering also to the great exporting houses. These vary from large and wealthy establishments to lesser factories handling but small quantities. They are of course houses which confine themselves exclusively to manufacturing. The output of many of the factories is entirely or in large part controlled by some of the big exporters.

The annual export trade has grouped itself in three seasons: Christmas, Easter, and Hallow'en. Originally the Christmas season alone occupied prominence, because

Easter and Hallow'en goods were called for in but small quantities. Later the Easter trade developed, and within the last few years the demand for Hallow'en goods in America has developed so tremendously as to create an entirely new line of business. Every country has its own shipping season for toys, according as its distance from Sonneberg is greater or less than that of another. Thus Christmas toys intended for Australia are shipped much sooner than those for the United States, while toys for America are shipped earlier than those going to England, and those for England sooner than those intended for the German market itself. The result of all this is that the great exporters are kept busy all the year around, though a noticeable concentration occurs in July, September, and even in the early part of October, when the main exports of Christmas toys are made to the United States. The toy industry in Sonneberg has received quite a boom by the craze for Teddy bears, over 10,000 going every week to the United States and also to England and France. Numerous Caruso monkeys also found a ready market in America.—American Review of Reviews.

NEW YEAR IN THE FAR NORTH.

It is left to the Eskimo to perform the most curious of all the many ceremonies with which the New Year is ushered in. In that far land of ice and snow a few moments before the old year's departure, from each little hut a couple comes forth, a man and a woman; in turn every igloo of the hamlet is visited and in solemn silence the hearth fire is put out. At the stroke of 12 all the fires are rekindled and the New Year is started with a bright new blaze. Mysterious ceremonies accompany this queer custom, and for a brief moment once a year our neighbors in the frozen North are without a spark of fire.

In Russia, on the eve of Dec. 31, the unmarried persons send their servants or go themselves out into the street to see what men or women they will meet, for the first person will be the future life companion. Russians lads and lassies often make most skillful plans to see that the right individual is on hand.

When the hour strikes midnight, each member of the family is saluted by a kiss, and with solemn words good wishes and blessings are given. If "Happy New Year's" cannot be exchanged by word of mouth, the sentiments the persons wish to convey are published in the newspapers, and the journals on Jan. 1 are eagerly read for these messages.

Norway and Sweden are hospitable countries, and a bountiful feast is spread in Stockholm at the exchange. The king is usually present, and always meets his people in the most democratic manner.

In Denmark the New Year comes in with full military honors. The booming of cannon is deafening, and the most delicate compliment to be shown to a friend is to fire guns and pistols under the window as the old year vanishes.

Every monarch in Europe, save the King of the Belgians, recognizes the advent of another year by some sort of a religious observance in which the divine blessing is invoked and strength and wisdom implored in guiding the state, but his majesty of Belgium goes on his erratic way, regardless of God or man.

Echoes from Everywhere

FOREIGN.

The persistent rumors that have been current to the effect that Ambassador Bryce was to be called home, have been officially denied. America would be sorry to lose James Bryce.

Germany expelled a good number of Mormon missionaries a month or two ago. Now Switzerland is preparing to follow the example of her bigger neighbor. The Swiss authorities recently arrested a party of Mormon elders, for carrying on the propaganda among young Swiss women.

The brother-in-law of Maxim Gorky, one Ivan Rukawishuikow, has come to America from Eastern Siberia. He will write for the papers and magazines of New York's East Side, but he can scarcely feel the need of making a name for himself.

A new development in maps which will follow the introduction of aerial navigation will be the charting of airship harbors. Taking a lesson from the gale which recently brought disaster to the Nulli Secundus, the first British military airship, officers of the balloon corps at Aldershot set to work to discover suitable natural shelters in various parts of the country, such as hollows in woods, protected places at the foot of hillsides, and deep gravel pits, where an airship may descend in case of emergency and lie safely during a gale.

The Japanese are fighting the savage head hunters of Formosa with electricity. These Formosans who indulge in war for the sake of accumulating a collection of the heads of the men they kill number about one hundred thousand, infesting the eastern coast of the island. Since their recent massacre of three hundred Japanese and Chinese, the soldiers, when they have located a party of them, surround the place with a wire fence, which they charge with electricity. Then the soldiers begin to shoot; the savages stampede, and the deadly wires get those that the bullets miss.

History is made fast nowadays. In spite of the fact that the automobile business is so young that it does not seem as if it were time to begin to commemorate its heroes by public monuments a statue to an automobilist, Mr. Levassor, has just been erected at the Port Mail lot, in the heart of the Paris automobile district. Mr. Levassor was the pioneer in the automobile industry, and more than that, his death was caused by an accident which occurred in one of the first automobile races. We may next look for a monument to the man who invented ping-pong.

The only seven-masted schooner in the world, the Thomas W. Lawson, was wrecked recently in the Sicily Islands. Fifteen of the crew of eighteen were lost. The immense schooner, the largest sailing vessel in the world, was launched five years ago from the Fore River shipyards in Massachusetts, and had been engaged in the coastwise and Atlantic trade. She was 375 feet long and fifty feet wide. The value put on her was \$300,000 and she was not insured.

GENERAL.

More than 40,000 men who have been idle for several weeks will return to work. Other mills in the district will also resume in full shortly after the first of the year,

practically doubling the number of workmen employed within fifty miles of Pittsburg during the past few weeks.

Oklahoma is going to make its state banks guarantee each other's deposits. Persons interested in the banking and currency question will watch the results, even though it may take years to try out the law. If the Oklahoma bankers have to dig down into their pockets to pay the depositors of some imprudent fellow banker, they will either make a vigorous effort to secure the repeal of the law or else they will unite for self-protection and insist on such mutual control of each other's business as will nip all threatening evils in the bud. However, not only does a successful mutual guarantee of asset note issues exist among the Canadian banks but Comptroller of the Currency Ridgely in his annual report spoke of such a project for deposits as one which was at least possible of serious consideration. Oklahoma's free gift of practical experience is, therefore, to be welcomed.

Nine hundred and thirty-eight indictments were returned by the county grand jury, in Kansas City, Mo., principally for violation of the Sunday closing law. Of this number sixty-five indictments were against the managers and employes of theaters, for specific violations of the law last Sunday; several hundred were against pool hall and cigar store owners, and twenty against negroes for selling, or bootlegging, whiskey on Sunday. In the two months this grand jury has been in session it has returned a total of 2,039 indictments, more than six hundred of which have been against actors, actresses, and theatrical managers and attachés. This all is a result of the Sunday closing crusade started by Judge William H. Wallace of the Criminal Court.

Manufacturing interests are moving Southward. The Piedmont region, that district in and near Charlotte, N. C., is becoming the greatest textile center in the world. There capital and engineering skill are harnessing enormous water power. It is estimated that over two million horse-power can be developed from the streams in this one section alone, and this represents the labor of six million human beings. Indeed, today, without one-quarter of the accessible power being used, more electricity is generated in this section than in all New England. One plant at Great Falls, on the Catawba River, already supplies more power than is produced in Holyoke and Lowell combined. The Southern Power Company will soon have at Great Falls the largest electrical plant in the world. With the increasing development of her limitless natural resources, and with the strong stand in prohibition which she has taken, the economic power of the South in the future seems to be a thing of enormous possibilities.

While Fairman in Paris is flying better and better on his aeroplane, Professor Alexander Bell, the inventor of the telephone is perfecting his kite, the Cygnet, which he expects will solve the problem of aerial flight. The Cygnet is made of a great number of tetrahedral cells, that is, little, four-sided pyramids which are very buoyant. Lieutenant Selfridge, of the United States Army, ascended in the kite a few weeks ago, when it was launched in Nova Scotia. As soon as it is equipped with a motor Professor Bell and his assistants think it can fly independently. Lieutenant Selfridge says: "It will be only a matter of time when the Cygnet, or an improved machine of her type, soaring on high in absolute control, will occasion no more comment to watchers from below than an automobile does today, threading its course through a busy thoroughfare."

Apparent it is that Mrs. Cobden-Sanderson of London is not favorably impressed by what she has seen and learned of Americans since her arrival in the United States on Oct. 25. "The New York woman," she says, "has too much money to spend. With these enormous fortunes at her command she steepes herself in the degradation of luxury. She adorns her person until I am often minded of a Turkish harem. She measures all humanity by its clothes, as her husband measures all his fellow men by their wealth and their ability to acquire more wealth. She has no time to think of vital questions of the hour, no civic pride, because she is too busy adorning her person, to know what is really going on in the great world of underdog humanity. In America, particularly in New York, the men give their undivided attention to making money and trust their wives to hold up the educational, the intellectual, and the sartorial end. The Englishman takes pride in what his wife does for his country; the New York man in the appearance she makes of his money. It is money that is sapping the minds and bodies of New York's so called aristocracy today."

SARAOFF AND MACEDONIA.

The death by assassination by Boris Saraffoff, the most noted Bulgarian champion of Macedonian freedom, calls attention once more to the awful condition of Macedonia. Saraffoff, himself, had hated the Turks ever since his boyhood, when his father and grandfather were beaten before his eyes and then dragged away to prison. Saraffoff began raiding in Turkish territory in 1895, and ever since had continued his guerilla warfare. He is accused of being responsible for the capture of Miss Stone, the American missionary, in 1901. Certainly the revolutionary activity in 1903 was financed with the \$60,000 paid for her ransom.

The warfare which Saraffoff and his fellows conducted was not in behalf of Macedonia, as a whole, but only in behalf of the Bulgarians there. Macedonia is ruled by the Turk. It is inhabited by Turks, Greeks, Bulgarians and Servians. All the Christian races want to get rid of the Turks, but Greece, Bulgaria, and Servia, each want to rule the country when the Turks are eliminated.

When the powers interfered in 1903, after fifteen thousand Bulgarians had perished in seven months of fighting, among the measures of reform ordered by Russia and Austria, as the mandatories of the European concert, was one providing for a redistribution of the administrative divisions in the three vilayets, "with a view to a more regular grouping of the various nationalities." The reform program has accomplished practically nothing, but the provision for "redistribution" has set the Servians, Greeks and Bulgarians to fighting each other, each race actuated by the hope of extending its own sphere of influence. A conservative estimate puts the average number of deaths by violence in Macedonia during the years of the "reform" at two hundred a month. The strong hand of fearless outside authority is needed to bring order out of the prevailing chaos.

IMMIGRATION FOR 1907.

The report of the Commissioner General of Immigration shows that in the year ending June 30, 1907, 1,285,349 aliens were admitted to this country, compared with 1,110,000 in 1906, an increase of seventeen per cent. At the same time, the aggregate number of outward bound passengers, 569,882, was 73,145 larger than in 1906. The Commissioner estimates that with an increase to our population by immigration of 1,000,000 per annum, which is less than the present rate, and the present rate of natural increase, the United States would reach the density of China in about four generations, or more particularly, in 134 years, at which time we would have a population of 950,000,000. The figures show that the efforts of the Southern States to increase the amount of immigration at their ports has had some effect, although more than a million of this year's arrivals came to New York.

The most interesting feature in regard to the number of immigrants coming from different countries is the great growth of the Japanese. Where 14,000 came in 1906, 30,000 came in 1907 and this in spite of the new regulations. The Tokio government is said to be ready to settle the immigration problem by refusing to allow "coolie" laborers to come to America, but it is not willing to embody

the restriction in a treaty. The immigration from the southeastern corner of Europe, Greece, Servia, Bulgaria, Montenegro, and Turkey, doubled in the year, being 68,000, compared with 33,000 the year before. The number from Italy increased less than five per cent.

Congressman Charles N. Fowler, chairman of the House committee on banking and currency, in discussing the money question recently, said: "If this government continues its present policy of injecting into the arteries of trade and commerce of fixed, bond secured currency, by swapping securities, by bond speculations, by treasury manipulations, and by executive orders, we will move toward a financial break-down—a commercial tragedy—compared with which the present currency panic is only a summer outing." Briefly stated, Mr. Fowler advocated the establishment of a credit system of currency, to be issued at will by the individual banks to an amount equal to their capital. He insisted that nothing should be allowed as a reserve except gold. "We demand that the reserves in our banks shall be in gold coin, and shall be ample to prove their credits and to protect their millions of depositors who have \$12,000,000 to their credit."

The Steel Trust's Souvenir of the Recent Panic. Only \$30,000,000 Gain.

At the International Conference of Religious Liberals which recently met in Boston, Prof. Groeneuegan, a noted Dutch preacher and editor, made the following statements concerning the spiritual life of Holland which stand out in contrast to the mere theological side of that country. "Among our preachers those are the most loved who are not only the best orators, but also utter most clearly and resolutely their purely religious convictions and whose personal piety is felt as the touch of a life which kindles life. Many people have grown tired of theological, biblical, historical, and moral questions. They want to adore, to trust, to obey, to love their God. They want the pure religion of the Gospel. If we do not give it simply, clearly, and warmly, fresh from the heart to the heart, people will be seeking elsewhere. And the longing for a new religious moral activity goes astray in socialism. Most of our Christian socialists are full of warm religious feeling. But the more stress they lay on social reform, the greater danger that they will bring more religious people to socialism than socialists to religion."

WANT AND EXCHANGE

WANTED.—To correspond with Brethren who desire to know the best, safest, most economical and most convenient method of lighting their homes.—W. G. Nyce, St. Peters, Pa.

NEFF'S CORNER

Busy times, these, about Clovis. Between telling the readers of several other journals about conditions here, answering letters, receiving callers from all parts of the Union, and looking after house building, I can't find time to tell the 'Nook readers near all there is to tell. A friend with whom I sojourned awhile in Texas, while on my mission wagon tour, has just been here, bought a lot and ordered a house built. Concrete work has been finished on the big depot 135 feet long. The concrete Harvey house with frontage of 146 feet and a 134-foot wing, and big basement, all to cost about \$60,000, is now in process of erection. If you would like some property close in or cheap farm lands near by, come soon or write

Just Published!

"RAYS OF THOUGHT"

By Josie Dayton Curtiss

This late work is the thought of mature years placed in poetry. The book contains about 50 poems on various subjects.

A few of the titles are:—

"A Study from Nature."

"Cause and Effect."

"Grandfather's Place."

"Our Ideal Home."

"Storms of the Soul."

"The Judgment."

"Rays of Thought" Appreciated

The first unexpected words of appreciation for "Rays of Thought" were voiced from the pulpit by Mrs. Curtiss' own pastor, Rev. Wesley M. Embree, soon after it appeared from the press of the Brethren Publishing House.

From a numerous collection of kind words from many people regarding the volume we select the following: Ex-Prof. Hyslop, Columbia University, New York, says: "A glance at the contents shows me I wish to read it all." Elbert Hubbard says: "'Rays of Thought' shows a deep insight into things." Prof. Mangold, University, Pa., "Expresses a wish to hear more from the writer upon a specified topic." Luther Burbank, California, is especially kind and commendatory regarding thoughts on page 139.—Republican News, Marenango, Ill.

The book is well bound in cloth and gold stamped. Size 5¼x7¾ inches.

Price prepaid,\$1.00

A copy of the "Ideal Nurse," a 16 page folder with cover, free with each book.

LOMITA, CALIFORNIA

1. Situated four miles from the ocean, and near San Pedro Harbor. Rich soil, excellent natural drainage. Can grow crops 12 months in the year.

2. Three wells of soft water for irrigation and domestic purposes. Water piped to each one's land. Settlers to own all water systems.

3. Natural gas comes up with water, and is used in engine to pump the water, making the expense of lifting quite nominal. Gas leaves the water on reaching the air, hence pure water.

4. Markets at the front door and back door; land and water transportation to all the world.

5. Grain and corn raised without irrigation. Crops from October to May, barley, oats, wheat, onions, cabbage, beets, peas, cauliflower, radishes, citrus and deciduous fruits, nuts, and vegetables in their seasons. Government analysis of soils shows much of this land very fine for oranges and lemons.

6. Six lots donated for German Baptist Brethren church. Good opening for business. No saloons, no pool rooms can be operated on these lands.

7. All kinds of produce bring good prices, at San Pedro Harbor and Los Angeles. Profits from \$100. to \$500 per acre per year. Settlers arriving right along. This colony sure of success, as it has the soil, the water, markets, the push and a twelve months' climate to grow useful things.

Olive Branch of Peace

Valuable Contribution.

Dear Brother Hays: I have ordered a copy of your book, "The Olive Branch," and have read it with exceeding interest. It is a valuable piece of contribution, not only to the history of the Valley of Virginia, but also to the history of the Brethren Church and other peace loving societies of God's people. Especially is it valuable as a clear and full statement to the world of what the world is coming more and more to recognize as just, reasonable, and desirable—Peace, and the spirit of Christian peace. I pray and believe that by means of this book, "The fruit of righteousness is sown in peace of them that make peace."

Yours fraternally,

John W. Wayland.

University of Virginia, Charlottesville, Va., Oct. 29, 1907.

This book contains 232 pages, has a number of illustrations and is well bound in cloth.

Price prepaid,75 cents

AGENTS WANTED.

ALBERTA

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the Brethren already there and enjoy some of the material benefits as well as help build up one of the largest Brethren Colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

¶ For particulars and cheap rates apply to

BUTTE VALLEY CALIFORNIA

and

ROGUE RIVER VALLEY OREGON

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

Take the

Union Pacific Railroad

Daily Tourist Car Line

BETWEEN

Chicago, Missouri River, Colorado,
Idaho, Oregon, Washington and
California Points.

TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

Be sure to buy your ticket over

The Union Pacific Railroad

known as the Overland Route, and is the only direct line from Chicago and the Missouri River to all principal points West. Business men and others can save many hours via this line.

Macdoel News

MACDOEL, CALIFORNIA, DECEMBER 26, 1907

J. R. MOORE of Saskatchewan, and Mr Eikenberry from Greene, Iowa, came in on the stage this week. Mr. Moore's family has been here some time, on the land that he bought a year ago. He reports that the early frost in Canada and northern parts of North Dakota destroyed much of the wheat crop, making it very hard on the farmers, many of whom are preparing to leave that country.

Many letters are being received by the settlers in Butte Valley, from their friends in the East who are preparing to move out here in the near future. Some of these will take advantage of the special excursion leaving Chicago, on Tuesday, Jan. 14, and Omaha on Wednesday, Jan. 15, in charge of D. C. Campbell of Colfax, Ind., and Isaiah Wheeler of Cerro Gordo, Ill., as it will enable them to get in through tourist car in the East, without change of cars until they arrive in Butte Valley.

On Christmas eve there was a wedding at the Hotel Macdoel, the high contracting parties were Miss Elva Lizer and Mr. Charles Bigham, both of this place. The ceremony was performed by M. D. Early. The bride and groom were charivariated in the regular old-fashioned style which needs no description, as most of the readers of these notes have at some time in their life participated at a similar event.

Mr. Aaron Bechtel and Mr. Frank Lapp are fitting up a nice chest to use for shipping Butte Valley exhibits to the East, which will consist of samples of grain, grasses, potatoes, turnips, beets, etc. As many of the readers are interested in having their friends in the East see what we do grow here, we would suggest that any choice samples of such products that they may have should be brought to the Postoffice at Macdoel to be sent East for inspection, as this chest will make periodical trips whenever a good supply is available that will be of interest to the would-be homeseekers.

Mr. Rosman, agent for the famous Stark Brothers Nursery of Louisiana, Mo., advises us that they have sold trees sufficient to plant 70

to 80 acres here in Butte Valley this fall, most of which are choice varieties of apples. When Prof. Wixon of the University of California was here in October and learned that the settlers of Butte Valley were purchasing their trees from this firm, he said that he was glad of it as they were always as careful about the inspection of trees that were brought to California as the most rigid State Inspector could be.

A seed depot is being established at Macdoel by the Portland Seed Company, to be under the supervision of Mr. Rosman, which will supply choice, reliable seeds for the farms and gardens of the settlers of Butte Valley. This is a good move, as it enables everybody wishing to plant either farm or garden to do so knowing that he will reap good crops, as he is furnished with good seed.

A number of parties in the East are asking for freight rates from various points, on household goods, live stock and farm implements to Butte Valley. We are requested to announce for the benefit of these people that the rate in car load lots on the above named articles is about \$200.00 a car to Bray, Cal., the present terminus of the railroad in Butte Valley.

The question is often asked by our Eastern correspondents, "Is it advisable, and is it safe, to ship horses and other live stock from the Middle West to California? Do they get sick, or do they get the lung fever, or does it take them long to get acclimated?" The best answer to these questions is to refer them to the settlers who are already here, some of whom brought horses and cattle from as far East as Indiana, Illinois, Iowa, Nebraska and Kansas, and in every case the stock arrived here safe, and went right to work and has never been sick. Especially is this desirable, for when they make sales in the East they have to accept whatever is offered for their stock. Upon their arrival here they have to pay the highest market price to replace them.

Mr. D. J. Root, one of the new arrivals from Oklahoma, has built on his land north of town.

CALIFORNIA BUTTE VALLEY LAND CO.

SAN FRANCISCO, CAL.

Possibilities of IDAHO

Unlimited

Many Brethren are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for Brethren and others of small means to get good comfortable homes with a splendid income.

Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

Realize \$1,000.00 Per Acre

Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

No. 2.

Relation of the Geological Survey to Drainage Work

Address of George Otis Smith, Director U. S. Geological Survey, before the National Drainage Congress.

[The Inglenook has the good fortune to have a warm friend in the United States Geological Survey, Mr. Guy E. Mitchell, who will discuss during the year the national questions of irrigation, swamp drainage, reclamation of desert lands, artificial water basins, regulation of river flow and such other phases of internal improvement as belong to this department of government service.]

Our readers constitute a class of producers unexcelled in the world. The earnest tone of the magazine reflects the earnest life of its constituents, so that the extensive improvements which the Geological Survey forecasts in articles to follow will be gladly welcomed by our readers, for we very much prefer national expenditures for rural improvements to that of military and naval improvements.

We venture the assertion that history will record the

degree in 1896; and also nearly fifteen years of active service in the Geological Survey of the United States.

He is a man who does things, and one in whom the government can repose great confidence. Already he has made exhaustive research in Michigan, Washington, Utah, Pennsylvania, North Carolina, New Jersey and the New England States. Mines, artesian basins, river channels and mountain formations have been mastered in such an authentic way that his writings on these subjects have been eagerly received by both the government and the public press.

Elsewhere we give the picture of the man who shall lead in reclaiming hundreds of millions of acres of rich soil upon which tens of millions of our posterity will live in peace and plenty.—Editor.]

As a national problem, the reclamation of the swamp lands over the United States is awakening as much interest as the reclamation of the arid lands of the West. We might trace the history of this movement and note that the earliest work in swamp reclamation was that of Colonel Byrd and George Washington, both of whom, before the Revolution, made surveys of the Dismal Swamp and planned drainage projects. The action of the federal government a century later might also be mentioned, whereby there were ceded to the various states over sixty million acres under the

Swamp Land Act of 1850, which provided for their reclamation, and it might further be noted that attempts were made in North Carolina, Florida and California, in early days, to recover large acreages of swamp land within their limits. Yet it is only within the past few years that the full importance of the problem has been realized and united efforts have been made for its solution.

Colorado Desert Lands. Enough Water Wasted in Freshets Each Year to Irrigate 200,000 Acres.

greatest inland water improvements in the United States during the next half century that this world ever dreamed of. The rivers are provided by nature, business congestion is making the work imperative and public men are agreeing to the work, so that the papers which shall occasionally follow the present one, not only indicate a national movement of wonderful proportions, but also its imminent achievement.

George Otis Smith, who is now director of the United States Geological Survey, is a young man yet, only 36 years old, but into those 36 years he has crowded a course at Johns Hopkins University, which gave him the Ph. D.

I will, however, mention only the later developments, for it is the present tendency that is of the greatest importance. This tendency appears to be toward active coöperation between the States and the federal government in the solving of the drainage problem. The efforts, then, should be to determine the most effectual agency which can be employed, for it is evident that the reclamation of swamp lands is the next step in the utilization of the nation's resources. Therefore, the relation of any federal organization to so important a work is worthy of consideration.

The first contribution of the United States Geological Survey to this great work was made over twenty years ago, when Director Powell assigned the study of the swamps of the Atlantic Coast to Professor Shaler. The report of this geologist called attention, both to the value of these great areas and to

thorough and minute study of all the conditions connected with this work before undertaking the construction of any system of drainage. Many drainage projects have failed and their failure has prevented the constructing of other systems, although the failure was only due to the fact that the preliminary investigations were confined to the immediate vicinity of the work. Thus, State Engineer Hall, of California, in 1880 brought out this point strongly by showing how a levee around one farm may cause the inundation of large tracts above; or again, the absence of a levee at one point may permit water to become impounded lower down the stream thereby drowning lands for long periods.

In two branches of its regular work, the Federal Geological Survey is contributing the data which is so essential to the proper solution of the drainage problem. I refer to its topographic maps and its

records of stream gauging. In both branches the Survey is continuing its investigations over the whole country, a fact which adds the greatest value to the results already attained, and too great emphasis cannot be put upon the necessity of continuous gauging of streams, since interrupted records are of little value.

As you may know, topographic mapping has been extended over nearly *one-third* of the area of the United States, and the topographic maps made in

Building a Big Dam.

the need of obtaining thorough knowledge of all the natural conditions before planning extensive drainage work. As to their value Professor Shaler pointed out that they contain the dormant resources of the nation, citing the fact that much of the area of the extremely fertile lands of northern Europe, especially in Great Britain and the low countries near the mouth of the Rhine, was originally in the unprofitable condition in which these American swamps remain. He also showed that these swamp lands, when won to agriculture, promise a food giving value much exceeding any equal area of high lying land in the country. Yet this early recognition of the value of these lands is of less interest to us than the realization at that time of the necessity of basing any reclamation work upon accurate data, procured by careful and systematic investigation. It is with such a policy that later work by the Geological Survey has been planned.

In stating the drainage problem, too great emphasis cannot be placed upon the necessity of making a

recent years are based upon surveys so detailed as to be of the greatest value for engineering purposes. The thousands of miles of spirit levels that have been run and the permanent bench marks distributed all over the country furnish exact data for engineering projects. The maps printed and distributed by the Geological Survey show the location and exact boundaries of the swamps and their relations to the natural drainage channels, as well as the topographic configuration of the surrounding country, which latter is of the greatest importance in planning the drainage of the swamp areas.

It is believed that with these maps in hand, the engineers who shall plan the drainage works may provide for economical construction, whereas, formerly, hundreds of thousands of dollars were wastefully expended because of this very lack of accurate general knowledge of all the physical conditions.

No less important, in their relation to the drainage problem, are the records of stream measurement and the study of river flow based thereon. A necessary

preliminary to any intelligent drainage work is the study of the conditions affecting run-off, in order that the proper equilibrium between rainfall and run-off over the area to be reclaimed may be established. Drainage involves the increase of run-off so that the rainfall for the specific area must be known and then the proper amount by which the run-off is to be increased to secure the desired drainage must be determined. Beyond that point the run-off should not be increased. It is, therefore, a question of channel capacity and not only capacity of the channels to be constructed to carry the water from the swamp land, but also of the river channels into which this increased run-off must be conducted.

The possibilities and needs of drainage surveys in many parts of the country might be discussed; but it is necessary to pass by such inviting fields as that of

culturally will become the most productive land in the delta. During the past summer within this area of the Yazoo Delta a party of the Geological Survey topographers, acting in coöperation with the State of Mississippi, thoroughly mapped 325 square miles or over 200,000 acres, at a cost of one and three-tenths cents an acre. In the course of this survey every slough, bayou, stream, river, drain, road, railroad and trail was surveyed with instrumental precision. The location of all houses, schools, churches and sawmills was determined and civil divisions, such as sections, townships and counties were defined. The gradient of the streams and the location of the timbered and cleared areas were also determined with accuracy, and lines of spirit leveling were carried over all the area with particular care to secure exact elevations in the sluggish bayous. The result of this survey, costing

only one and three-tenths cents an acre, proves beyond a doubt the feasibility of draining every acre of this most fertile section. While the map which is being prepared of this area may not furnish the engineer all the data needed in the precise location of his drainage system, or for his final estimates of construction cost, yet this map will serve the purpose of a preliminary survey, and with it before him the engineer can plan the broad features of the project and begin his detailed field in-

The Finishing Touch.

the Dismal Swamp, the reclamation of which would mean so much to Baltimore as a commercial center, or that of Illinois, the state which stands first in the value of her farm lands and improvements, and where the drainage problem is connected with that of prevention of stream overflow, which involves an annual loss of several million dollars' worth of farm products. We will pass by these and other interesting topics and mention specifically the work of the Geological Survey in only three states, where recent surveys bear directly on drainage—Mississippi, California and Minnesota.

In Mississippi the state geologist estimates the area of undrained land at over six million acres. More than two-thirds of this area comes within the Yazoo Delta, where it is believed proper drainage will quadruple the value of much of the land, while portions of it will be increased from its present nominal timber value of \$10 or \$15 per acre to \$100 and upwards per acre. That which is now absolutely useless agri-

speciation and location of canals and ditches, with the assurance that he is not overlooking some feature or condition in the surrounding country that may work disaster to his drainage system.

In California, in the valley of the Sacramento and along the tributaries of that river, there are about a million acres of the richest of lands, which are, however, subject to overflow. In some areas where this land has been reclaimed by private enterprise, it is valued for market garden purposes at \$500 and upwards an acre. For several years, in coöperation with the State of California, the Federal Survey topographers have been making surveys of these wet lands, and resulting maps have been published on scales specially suited to the work of engineers, with contour intervals of five feet. These field surveys cost about two and a half cents an acre, and yet are executed with such a degree of refinement and detail as to make the best examples of this class of work. The difficulties attending such surveys can be ap-

preciated when it is stated that in some of the tule lands the spring and the fall floods almost overlap; thus leaving only a few weeks at the most when the topographer is able to make his surveys.

The best illustration of the direct connection of the United States Geological Survey with drainage work is offered by the surveys made in Northern Minnesota. Congress has made two appropriations, amounting to \$25,000, for the purpose of drainage surveys of the ceded Chippewa Indian lands, to be executed under the Secretary of the Interior. This is a vast swampy region, with here and there farm houses on high points, which are, however, for weeks at a time marooned from civilization. Individual at-

spirit levels, and hundreds of miles of such levels have been completed with very refined methods. Such work was often carried on through the so-called "floating bogs" by means of seven-foot legs attached to the level, making an instrument the carrying of which was in itself a good day's work.

The report of this survey shows that the necessary work involves the drainage of 267,000 acres and the improvement of 135,000 additional acres, or the reclamation for farming and residence purposes of 402,000 acres of land now practically worthless. Main lines of canals to reach every 160 acres have been designed by the Geological Survey, and the estimated cost of these works is only \$3.23 per acre for the

actually drained lands and \$1.35 per acre for the improved lands, a total for the 402,000 acres of about \$1,080,000.

The most conservative estimates of the values which would be added to these now useless tracts, above the cost of their reclamation, range from 400 to 600 per cent. In this region of Minnesota, drained lands are selling at a premium at prices varying from \$12 to \$15 per acre. The entire cost of this field survey has been only \$10 per square mile or about one and a half cents per acre; yet the results secured at this slight expense show that

Waste Gate in a Huge River Dam.

tempts at drainage have been mainly unsuccessful, owing to the magnitude of the project and the fact that most of the land to be benefited belongs to the federal government. The surveying of this swamp was turned over to the Geological Survey, as the bureau best fitted to immediately prosecute it. Parties of topographers were in the field during the season of 1906 and an increased force resumed work in the spring of 1907.

As a result of the first season's work, a map embracing 624 square miles, constituting the Mud Lake Drainage District, was made, and, together with a preliminary report of estimates, was forwarded to Congress, and the result of the work of the present field season will be submitted as soon as it is completed. In the surveys of these areas to be drained, special attention was paid to the running of lines of

the plan for drainage of the area is entirely feasible, while the completed maps, indicating streams, natural drainage channels, elevation figures, etc., will afford an accurate basic survey upon which the drainage construction engineer can confidently rely.

It is believed that the federal appropriations for preliminary drainage surveys of the ceded Chippewa lands have been so expended by the Geological Survey that the Interior Department can now plan the construction of the drainage project. In a word, then, the topographic maps of the United States Geological Survey exhibit not only the general distribution of swamp lands and their relation to the master drainage lines of the region; but the work can also be readily executed on such a scale as to constitute an adequate preliminary survey on which to base estimates and general plans looking to actual construc-

tion of any drainage works, and in a similar way the stream gauging records of the Geological Survey furnish data which must be considered in any wise and conservative attempt at the reclamation of our swamp lands.

ALPHABET OF AMERICAN AUTHORS.

G. FEGLEY.

IX. Washington Irving.

WASHINGTON IRVING was born in New York City, April 3, 1783. His father, William Irving, was a native of Shapinsha, Orkney Islands, and traced his ancestry to DeIrwyn, armor-bearer to Robert Bruce. He married Sarah Sanders of Falmouth, England, and for a time was a seaman, but in 1763 entered commercial life in New York. Till he was fifteen

among which that of exuberant delight was not in every case the most prominent."

From 1813 to 1815 he edited the *Analectic Magazine* in Philadelphia, and then went to England where he was warmly welcomed by Sir Walter Scott, Thomas Campbell, and others. While there he received news of the failure of the commercial house of Irving Brothers. He next brought out "The Sketch-Book of Geoffrey Crayon," which contains "Rip Van Winkle" and "The Legend of Sleepy Hollow." He received £200 for the copyright, which was increased later to £400. It had a charm and freshness that gave it great favor with its English readers. He went to Paris and in 1822 brought out "Bracebridge Hall," and in 1824 "Tales of a Traveler."

In 1826 at the invitation of the American ambassa-

Pumping Water for Irrigation.

years old, young Irving went to school, with indifferent success, preferring to educate himself other than by the approved pedagogical lines. He studied law several years and was admitted to practice, but soon decided to adopt literature as a profession, although he was connected with his brothers in the mercantile business at the same time.

He was quite a "scribbler" from his earliest years, and in 1802 wrote the famous "Jonathan Oldstyle" letters for the *Morning Chronicle*, published by his brother, Peter. On account of his health he went on a trip to Europe, visiting Italy, France and England, returning in 1807. With his brother, William, and James K. Paulding, he wrote and published a magazine called *Salmagundi*. In 1809, he published "Diedrich Knickerbocker's History of New York" which "was received by the New York Historical Society, to whom it was dedicated, with astonishment, and by the old Dutch families with mingled emotions,

dor to Spain, Alexander H. Everett, he went with him to Spain, and at Madrid set about translating documents connected with the life of Columbus. He conceived the idea of writing a "Life of Columbus," which appeared in 1828, and brought him \$18,000. He also published the "Conquest of Granada." In 1829 he returned to London, having been appointed secretary of the American Legation. The Royal Society of Literature voted him a fifty guinea gold medal for his historical work, the other medal of that year going to Henry Hallam. In 1830 the University of Oxford conferred upon him the degree of L. L. D. He published "Voyages of the Companions of Columbus," and "The Alhambra," a group of Moorish tales of that wonderful old place, with a description of the palace, in which he had a room and wrote some of the stories. He returned to America in 1832, and traveled in various parts of the country, including a long journey to the west with the Indian commis-

sioner. He then wrote "Astoria," and "Adventures of Captain Bonneville, U. S. A." In 1839 he published "Legends of the Conquest of Spain," and in 1849 "Life of Goldsmith," and "Mahomet and His Successors." In 1855 he published "The Chronicles of Wolfert's Roost," and his last and most exhaustive work, "Life of Washington," in 1855-9.

He represented America as Minister Plenipotentiary to Spain from 1842 to 1846. He never married, some say because the lady of his choice died before the day for the wedding; he lived with his widowed sister and her two daughters. He died November 28, 1859.

Many of Irving's characters are household names, for instance, Rip Van Winkle, Ichabod Crane, Dolf Heylizer, Diedrich Knickerbocker. His humor is contagious. His descriptive powers are unrivaled because they are so lifelike and real. Yet it is said by some critics that he was not so successful as a historian, as he was as a writer of sketches and narratives, for the reason, they say, he describes too much and with too florid a style. Probably no other American met with such reception abroad from all classes and nationalities, numbering among his friends Scott, Moore, Byron, Campbell and Coleridge.

Worthy of mention: Rev. J. H. Ingraham, novels; William, Peter and John T. Irving (the brothers), essays, novels and poetry; J. T. Irving, Jr., sketches and novels; Charles J. Ingersoll, history and political.

Bryan, Ohio.

HOW WE THINK.

H. M. FOGLESONGER.

6. Will Power.

The first question to answer is whether there is a separate something in consciousness when we will to do a certain thing. The answer is, No.

The will, as it is known today, is simply a phase of mental activity. The will is not a separate and distinct "faculty." Our actions may be classed under automatic, reflex and voluntary and when we do a voluntary act we say we will to do it.

The ideas of movements, bodily or otherwise, tend to be followed by the actions themselves. This is a fundamental truth to be remembered. We see it more clearly in children, for if they think of doing a thing they immediately get busy at it. When the clock strikes five, we think of doing the chores, and in a very short time we are out at the barn feeding the horses and cows. The striking of the clock awakened certain centers in the brain that brought the idea, chores, into consciousness, and with this center the motor cells are concerned which send the message to the proper muscles. Ideas trying to flow out into bodily movements cause us to have a feeling of unrest until some movement is made, either wholly or in part. Of course not all our ideas are followed immediately

by their accompanying actions or else we would be a continual whirlwind. One idea prevents the actions of another idea because of its present importance or superior associations.

In ordinary life we inhibit many instinctive actions. When a child is hungry it wants to eat right away, and it often eats thing that make it sick. Grown-up people may become very hungry, yet they do not eat until meal time because the controlling factors of adult life are not present in the child. Older people control many of these instinctive actions because they live in organized society.

We have not yet touched the question, "why we will to do a certain thing." Under "Reason" we learned that we have certain established systems or sets of meanings that govern our daily life. All our past experience is thus organized. And under "Attention" we learned that what we see, and how we see things, depend upon our past experience and present mood, other conditions being equal. The same may be very truly said of the will because the elements of attention are the foundations of the will. Our daily life is governed by sets of "ideas" or "purposes," whichever you want to call them, and these sets of ideas have grown up in our past life. We will to go to church on a rainy day because we think it our duty, or because we take pleasure in attending church services. Were we governed by present circumstances alone, we would remain at home, but our past experiences over-rule the present. We have found pleasure in going to church in the past or because of religious convictions we consider it a duty to be present at every service. We do a thing because the bulk of evidence falls in its favor. By "bulk of evidence," I mean that in the past we have learned that such an action is beneficial or appropriate under certain conditions. On the rainy day referred to, there were arguments in favor of remaining at home as well as arguments for going to church, but the latter had greater weight. Some of those in favor of remaining at home were,—wet, disagreeable weather for people as well as horses; only a few will be present; spiritual benefit can be gained at home. The opposing factors are, disagreeable weather can be partly overcome by extra clothing; spiritual benefit does not always depend upon number present and I may miss something good by not going; and lastly I have always been present at every service with few exceptions. The truth of the matter is that we could do nothing else than go to church because of all these past habits and experiences pressing down upon us. A more exact statement would be that the factors in favor of going to church, so far as we have known them, will that we go to church instead of saying that we will not, etc. But the above things are a part of us, so after all *we* will to do.

It was said above that the idea of action tends to be followed by the action itself. Now, in voluntary

action the idea is very necessary. Often the idea is a certain end or condition in view. The idea that we must be in town at such a time wins out over other opposing ideas, and the result is, we go to town, because there is an inward feeling of unrest until we are in town.

Every one has experienced times when they had difficulty in making a decision. It is a mental condition hard to describe. Our whole being at times seems to be pulled at from all sides. It seems that we are being mentally torn to pieces. One inner voice tells us to do one thing while another tells us to do the opposite. Thus the battle is waged for minutes, hours and even days before one side wins out. By our theory of will, how can this be explained? Well, what happens in a long battle between armies? The more nearly equal the opposing forces the longer and more severe the struggle. Just so in mental battles. The problem comes to a young person, "Shall I continue my school work in the face of insufficient means?" and immediately numerous questions bob up. Some arguments touch his very soul fiber. Each side has numerous associations, all of which come into consciousness, and he really feels "torn to pieces." Suppose the end in view is, a thorough education, by which a good position can be secured. This seems more agreeable to him than anything else, and if he keeps on thinking about it, his school work will be continued.

Briefly speaking, a person of strong will power is one who is greatly influenced by past experiences in life, while a person of weak will power is one who is influenced chiefly by present circumstances. For all sane persons this rule holds good. To make a decision or to will anything, one thought must be in our consciousness, and remember this one thought will not be thus paramount unless it has grown out of the past; unless it has meaning to us. A person of indecision has been likened to a ship without a rudder by writers innumerable. He is like a ship without a rudder and without sails, too, for he never gets very far in life. They are turned about by every new thing because their past training does not rise up in the form of a decision. They lack the most important elements of a strong character. A person who never gives up to any new thing is stubborn and the one who never surrenders to the information gained in the past is shallow brained and points back to simple forms of animal life. Between these two extremes is the strong character.

For past experiences to influence us, they must have made deep impressions in our mind. They must have left definite paths in our brain. This subject has been discussed under "Attention" and "Reason" and need not be repeated. It has been truthfully said that to discuss the education of the will is to discuss the entire mental life, perception, memory, association, etc. But to lay aside purely technical instructions, I think

the best way to cultivate the will is to endeavor to have our life mean definite things. Build the future upon the best of the past and take up new things only after due deliberation. Do not accept anything, or rather do not do anything unless it means something to you. Be not boisterous, but think quietly. You can do this and still be free from melancholy. Remember, the will is not a thing in itself but simply a phase of mental activity depending upon all the other phases for its life.

If some of the INGLENOOK readers have any of those books on Phrenology containing hideous pictures of famous men, treat them as curiosities only. They represent theories a century old that cannot be defended in the face of present day psychology and brain anatomy. Also do not become greatly interested in the occult, hypnotism, mind messages, etc., unless you have had a thorough training in the elements of psychology. I mention this now because the next two articles will be about subjects somewhat different from those discussed in the past.

CURRENT COMMENTS

THE REICHSTAG DOMINANT IN GERMANY.

Recent events in the German Reichstag practically involved a fundamental change in the German scheme of government. The first Vice President of the House, Dr. Herman S. Paasche, one of the leaders in the "bloc," or union of parties, which supports the government, attacked the ministry for its financial policy, which allows expenditures to exceed the revenues, so that the country has to borrow money, and for its apparent intention to whitewash the officers involved in scandal through the recent Harden trial. In the past, the Chancellor would have met such insurrection by telling the Reichstag that it could either support him or be prorogued, as he was responsible to the Emperor alone. Instead of meeting the matter thus, however, Prince Von Bülow virtually threatened to resign if he were not supported, thus practically announcing that he was responsible to the Reichstag instead of to the Emperor, as in the past. This fundamental change would give Germany true parliamentary government, in place of government by the Kaiser with the counsel of the Reichstag.

PROBLEMS OF THE TRUST COMPANY.

The chief problems have to do with the accumulation of a proper cash reserve and the question of restricting investments. As the trust companies, under the present law, are able to "loan money on real or personal property," and "to lease, hold, purchase and convey any and all real property," they enjoy privileges not conferred upon any other financial institutions. The state banks are restricted in their investments "to stocks, or bonds, or interest-bearing obligations of the United States, or of the State of New York, or of any city, county, town, or village of this state, the interest of which is not in arrears." They must not deal in railroad stocks or in real estate, and are forced to content themselves with the revenues resulting from discounting and negotiating promissory notes, trading in exchange, coin, and bullion, and from loans made on personal security. The state banks urge that it is manifestly unfair for the state to restrict them in this way, when their competitors, the trust companies, which do chiefly the business of deposit banks, are given a free field for investment. It is for the commission to recommend, therefore, whether this freedom of invest-

ment should be continued, or whether the trust companies should be made to employ their funds in specific channels. While it may be urged that depositors have never suffered much from losses sustained through unwise investments of trust company funds, the fact remains that an unrestricted field affords opportunity for such recklessness as has been exposed in the case of the Knickerbocker. The commission will undoubtedly view the subject in a broad-minded way, but the fact that most of its members have been identified with the most conservative type of trust company banking indicates that its recommendations may impose some restrictions. Clark Williams, the new superintendent of banks, who will advise with the commission on these matters, is an experienced trust company official of decided ability.—Review of Reviews.

FOOD NOTES.

Number Two.

In discussing rabbit meat recently we only discussed the unsanitary condition of the rabbit after it had lain three weeks with head, hide, blood and entrails intact, as it was when shot. We said nothing about diseased rabbits, and the large per cent of rabbits killed which had warts, tumors and old sores caused by gun shot wounds, dogs and other animals of prey. These all go in as good rabbits.

As nauseating as the rabbit business really is to those who know the facts in the business, yet the rabbit market offers no parallel to the filthy condition of things which we have endured for a lifetime. We refer now to the grocery business. Many stores are exempt from the description which follows, but the condition to be outlined is very general from one ocean to another.

Most grocerymen keep a great deal of their eatables in open boxes where they are exposed to the dust, smoke, breath, fly dirt and such other saturation of fumes as the building contain.

During winter months it is a general custom for the men in the small villages to spend the long evenings in the village store, and in many of these evening resorts, tobacco smoke fills the rooms like a dense fog, and the sputum of consumptives and other diseased persons, together with the tobacco spit, covers a large part of the floor. We have seen numbers of floors where this spit had dried and accumulated until it formed a black crust over the boards as thick as ordinary oil cloth and could be pried off by the handful. People walked on this and the grocerymen swept it day after day. The smoke and breath at night was closed up in the room and finally lodged some place, and the fumes were absorbed by the eatables which remained open.

In the smaller groceries a box of dates, or figs, or apricots, or sauerkraut often remains open day and night for several months before the goods are all sold, so that considerable filth and unhealthy odor has had a chance to be absorbed by this food.

Then cured meats are often kept in an open condition for an entire season until they actually become black with the vapors of the room in which they hang.

The list of eatables that are generally kept open could be enlarged almost indefinitely, yet very few people seem to urge any change in this matter. That some legal action is needed goes without question. We give one instance which we experienced ourselves. Some butter was bought at a well-to-do grocery where the evening crowd assembled regularly to chew, and smoke and ———. Butter absorbs odors readily and this cake had lain unprotected all day in a cloud of smoke and dust. It was impossible to use the butter for any cooking purposes because of its very strong tobacco flavor.

No one can estimate the number of diseases and deaths and the failures of health which owe their origin to this one source—the unclean grocery store. In another paper to follow we will refer to another phase of unhealthy food products which comes still closer home.

THE GOVERNMENT EMPLOYMENT BUREAU.

When Governments begin to serve the people instead of aiding and abetting schemes for commercial and industrial oppression, they give promise of progress. The steps taken by the Roosevelt Administration in behalf of

men and women seeking employment, is a step in the direction of performing real functions of government. Good government is essentially paternal. Governments should not only look after their subjects in distress, but in prosperity also.

When the new Labor Bureau was established, a department of it was intended to impart information to immigrants and others, where different kinds of employment might be found. Later it was decided that the department should include an employment bureau, so that applicants may not only find information desired, but employment as well. If now the department assumes some proportions, and spreads in usefulness as has the postal system, it may go far to check the tyranny of labor unionism, and provide employment for thousands who do not desire to connect themselves with the striking and belligerent element of the laboring classes.

NICHOLAS TSCHAIKOVSKY.

The arrest of Nicholas Tschaikovsky on his return to Russia has occasioned great public interest in America, where he became widely known by his lecturing in this country last year. Tschaikovsky, who is now sixty-five years old, was the founder of the first revolutionary circle in St. Petersburg, in 1875. He was imprisoned for his revolutionary work and condemned to Siberia, whence he escaped to London. Later he came to America and lived in a socialist colony in Cedar Vale, Kans. He recently returned to Russia in disguise and has been arrested and confined in the fortress of St. Peter and St. Paul. His many American friends acted promptly to do what they could in his behalf. Five hundred influential men have signed a petition which has been sent to Baron Rosen, the Russian Ambassador in Washington, and to Premier Stolypin, asking the Czar to show the greatest clemency in regard to him, and also Catharine Breshovsky, who was arrested at the same place. Premier Stolypin has given assurance that the petition will have much weight, and that the cases will be judged as favorably as possible.

AN ENGLISH VIEW OF AMERICA.

No one can visit the United States these days without becoming conscious of a pervasive social unrest. The people are beginning to think. They have turned away, as Mr. H. G. Wells rightly discerned, "from all the heady self-satisfaction of the nineteenth century," and have commenced "a process of heart-searching quite unparalleled in history." They are questioning themselves and their future and their institutions with an open-mindedness, that, a decade ago, would have seemed well-nigh treasonable. Familiar ideals, established political and social systems, are being brought as never before to the touchstone of fact. The inadequacies of an eighteenth century constitution in the face of twentieth-century problems are daily impressing themselves on the national comprehension. Economic and industrial developments, it is felt, have taken on an intricacy and a varied sweep that are slowly bringing the constitution to a confusion of helplessness. More and more people are asking themselves whether the United States can any longer be called a democracy. More and more people are coming to see that under the forms of popular self-government, political equality has become the sport of "bosses," and economic equality the jest of a voracious plutocracy. The courts to an alarming degree are losing the confidence of the masses; the Senate has already lost it. The people perceive the emptiness of the old catchwords of political parties and are probably tiring of them. Republicans and Democrats, with their obsolete mummeries, will soon mean less than nothing to a nation that is girding itself to wrest its liberties from the grip of organized wealth. A wave of social protest is sweeping across the country, over all sections and with an utter heedlessness of the traditional party divisions. In city, state and nation, there is now but one issue, the struggle between equality and privilege. Great masses of Americans are growing up with an angry feeling that they have been cheated out of their inheritance. They see, or think they see, that the millionaire and the boss rule and own America; that together they control all the functions of government; that the courts and the ballot box are merely instruments of their power and the constitution a handmaid to their iniquities; that all legislation is conceived

in their interests, drafted and voted by their henchmen; and, that as a consequence, where there is one law for the protection of human life, there are a thousand for the protection of property. This may be a mere nightmare, visions of America, but it is one that hundreds of thousands believe in as a waking reality."

SETTLING ACCOUNTS.

The Russian autocracy, having largely regained its power, is now proceeding to settle accounts with the men, who have actively worked against it in the first two Dumas. A short while ago twenty-seven members of the second Duma were sentenced to varying terms at hard labor, in the mines of Siberia. Two weeks ago there were arraigned not less than 169 members of the first Duma, who signed the celebrated Viborg manifesto in the summer of 1906. The 169 deputies, all charged with high treason, include the president of the first Duma, its vice-president, and the leading men of Russia in every intellectual field. The terms of imprisonment allotted the members of the second Duma show what is in store for these men. The men on trial have shown themselves full of courage, in facing the charges. The Viborg manifesto urged Russians to refuse to serve in the army. The tactics of the defense are shown by the speech delivered by one of their number, Ivan Petrunkevitch, the veteran deputy from Tver, on one of the opening days of the trial. "Our motive," he said, "was not the instigation of anarchy; we were trying to defend the rights of popular representation. After the dissolution of the first Duma, the Russian Government expected an armed uprising, but we counseled the people to use peaceful measures, such as the financial boycott and refusal to serve in the army. These means are employed in western Europe for the defense of constitutional rights. If you open the gates of the prison we will enter joyfully, conscious of having done our duty." The Zemstvo Congress of 1904, an organization permitted by the government, proposed measures as revolutionary as anything contained in the Viborg manifesto. Perhaps the Czar will yet settle accounts with them.

SENSIBLE MEASURES.

The President's Cabinet is about to be enlarged by two additional chairs. The one most likely to be installed first is a Secretary of Internal Improvements. The vastness of our inland territory and the unsurpassed fertility of the central regions of the United States demand more federal consideration than they have ever received. The dredging of rivers, building of harbors, storing of overflow mountain waters, inland waterways, and federal buildings are all vital to our national prosperity.

Every other great government in the world gives systematic attention to works of internal improvement, with results that show up wonderfully in comparison with conditions in the United States.

In every branch of the government service and of government work for which annual appropriations are required, in the United States, except in the matter of internal improvements, some systematized department or bureau annually submits recommendations to Congress, based on investigation and study of the needs of each respective branch. President Roosevelt is opposed to adding to the size of the cabinet, but thinks that this question could be handled by some of the present departments. He is greatly in favor of more systematic effort in internal improvements.

The second cabinet officer to be hoped for is one on Public Health.

The advantages of the national bureau over state and municipal bureaus would be in dealing with interstate and international questions of health. The question of the pollution of rivers running between states, of the milk supplies used between states, and other like matters could be better regulated by a national bureau and we think it has been demonstrated that the death rate of the nation could be cut down nearly 50 per cent by federal supervision of these questions.

The report of the committee of 100 prominent men, including Andrew Carnegie, appointed a year ago to study the subject will be presented to the President. He will be asked by the association to send a special message to

Congress calling attention to the movement for the establishment of another national bureau.

Such departments as the above whose object is to help mankind and relieve suffering marks the transition from war, bloodshed and sorrow to that of a kinder spirit. We hope to see public benefits soon eclipse war expenses.

SAFETY IN AMERICAN AND EUROPEAN MINES.

In the coal mines of the United States out of every 1,000 men employed three and one-half are killed every year. In Belgium, where the miners work under conditions far more dangerous, the death rate is only one to every thousand employed. In Belgium efficient measures are taken for the protection of the lives of the men. Moreover, in America conditions are growing worse. Where the number of men killed to every million tons of coal mined was 5.07 from 1890 to 1895, it was 6.04 from 1901 to 1906. In Belgium, where, as has been said, the mines, on account of their great depth, are much more liable to explosions, in 1906 the number killed for every million tons mined was only 4.96. The Belgians have scientifically eliminated every possible factor of uncertainty. They determine the character of the explosives to be used in certain mines and the quantity which it is safe to use in the presence of coal dust and determine the extent to which it may be kept "safe" by spraying. Some dusts are found to be much more dangerous than others. They determine the quality of the gas in the mines and the percentage which it is safe to have in the air. They test the nature and extent of the electric currents used in the mines and make sure of proper insulation. They look into the character of the miners' lamps. Only two factors of uncertainty remain: outbursts of gas which may come from underground fissures, and the carelessness of the miners. To guard as far as possible against the first, they study the strata of the mine. To guard against the second by agreement between the miners and operators, they do not allow a careless man in dangerous places; they put him where he cannot make trouble. A visitor to the most dangerous mine in Belgium is compelled to change all his clothes so that the authorities shall know that there is no chance that he will take matches, or anything that could make trouble, into the mine. The result is that the only accident in the mine for seventeen years has been the breaking of a cage. The investigation to determine conditions of safety is carried on in Belgium in government laboratories, and the government informs the mine operators and the people of the results. More than three times as many coal miners, proportionately, lose their lives by mine accidents in America, as in France or Belgium, and nearly three times as many as in Great Britain. Either the coal operators or the government must undertake the same sort of measure for safety in this country. The state inspectors we do have in this country are, in good part, merely politicians. Public sentiment is being aroused on the matter as it was in regard to safety on the railroads last year.

THE NOBEL PRIZE WINNER, DR. LAVERAN.

Dr. Charles Laveran, who received the prize for medicine, gained his fame through his discovery of the animal parasite, called "haemataroa," whose presence in the blood causes malaria. In 1882 he completed his investigations in Italy, where he came on to mosquitoes transporting the malaria, which, for a thousand years, had depopulated that land. Thus the whole notion of malaria, as the result of bad air rising from marshes and newly-turned earth, was exploded. The effect of the discovery is to make tropical countries as habitable for white men as for native-colored races, since the destruction of the mosquito will eliminate the worst enemy to the white man—malaria. In his later years he has found out another miracle, which is probably the cause of mumps. His chief present work, long since begun, concerns the "tripanozomes," and the terrible African malady of the "sleeping" sickness. Dr. Laveran was born in Metz, in 1845, and since his graduation from the hospital until ten years ago, was connected with the army military corps. Since then he has devoted himself to bacteriological researches at the Pasteur Institute, at Paris.

THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

TO OUR NEW SUBSCRIBERS.

At this season of the year there is such an overflow of business in our Publishing House that new subscriptions may be delayed a week or more before they can be entered upon the mailing list.

We mention this to our new subscribers so that they may understand if their INGLENOOK happens to get to them a week or two later than they expected.

OUR FIRST THOUSAND.

SOMETIME ago we started a campaign for 10,000 new INGLENOOK subscribers, and the first thousand came as a Christmas present, which we surely appreciated.

We thank our agents and friends for this energetic response and we have great hopes for your future success.

Some of you may think that this is all a selfish matter with the Editor; that he gets more money in his pocket when the subscription list is increased. We get no increase of salary for increasing the circulation of our magazine, so that our appeal is a just one and not selfish.

Bad literature is causing so much havoc in every direction that we feel like pressing our cause with all the force we have, and at the same time, we want to awaken the same interest in our readers that we have, ourselves, in furnishing clean, helpful literature in every neighborhood.

WHY SOME ARTICLES ARE DELAYED.

SOME writers want to know why their articles are held a few weeks or months, before they are published.

We will explain so that the entire family may know something of the workings in an editorial sanctum. Here it is.

Sometimes we receive several articles of a very similar nature in quick succession, and when we have

published enough of this one kind of reading for the time being, we invariably hold back what new manuscript comes in bearing on the same subject. One of the good articles of recent date was held for one year, and it was still good when it came out in print, so that holding a good paper does not lessen its merit.

Again, the Editor may have the matter for several special issues all arranged for, a few months in advance, so that new manuscript must then wait until there is a chance to use it. We try to provide a variety of reading for our readers, all the year around, so as not to deaden the literary appetite by feeding too much of any one diet.

Does this answer your questions?

ARE YOU HUNTING FOR WORK?

You can make money the year around by selling the INGLENOOK and we need a few thousand agents all the time. Our magazine is large, clean and helpful, yet cheap in price. Tell your unemployed friends that we can always provide work for them in any part of the United States at any time.

WHY SOME THINGS GROW.

SOME things grow because they are forced from without, while some things grow because they strive from within.

Some movements spring into existence almost instantly because they represent a popular wave in the social world, while some movements, equally good, have a backward growth because they are ahead of time, represent a dead issue or are poorly managed.

This is well represented by plants.

Take two seeds of equal vitality. One is planted in a warm, fertile soil where plenty of moisture and sunlight are available. Its growth is rapid, but the fact is that nature is *forcing* this plant. Plant the other seed in a cold, scant soil, with little or no sunshine and moisture, and see that tiny plant *struggle*. It will wither, then revive, then shoot forth a sickly, but sweet bud. The elements were not available to make it grow. Had the seeds been reversed, then the prolific plant would have failed and the dwarf plant would have become glorious.

Just so with many efforts in life. Some people struggle against odds and make no big show in the world, but counting the amount of energy put forth and the number of opportunities improved, and they may outrank some noted people who were born into a popular wave of society and rode through life on the reputation of ancestry, or bought popularity with cheap trash in one form or another. Many men who are world renowned now, lived and died in obscurity. While some men whose names are in everybody's mouths now, will be erased from history in a few generations, and were they once compelled to start

life on the ground floor their name would never have become known to the public to start with.

Are you growing? If you are utilizing all available material, yes. If you are being pushed forward by outside forces only, no.

GOVERNMENT OWNERSHIP OF RAILROADS.

IN response to the question in the INGLENOOK six weeks ago whether the government had any more right to regulate railroad rates than it had to fix the price on daily labor or on the commodities of life, David Yeagley of Plymouth, Indiana, affirms that it has, for the following reasons:

1. Traveling is a public matter.
2. Wagon roads are public property. Why not railroads?
3. The Government has taken control of other public concerns in the past, such as mail service and rural highways. Why not control railroads?
4. Railroad companies continue to abuse the public in rates, accommodations and carelessness, hence have forfeited their right to conduct public business.

The rural highways in the Eastern States were formerly owned and controlled by private ownership but were finally taken over by the States and made public property and freed from the old "toll" system by which each traveler was charged so much per mile according to the kind of conveyance used.

Who will carry the investigation a little further, or amplify on the reasons already given?

PRESIDENT ROOSEVELT expresses the thought of every lover of righteousness when he said in his recent message to Congress:

"Honesty—not merely technical honesty, but honesty in purpose and spirit—is an essential element in arriving at a right conclusion. Vice in its cruder and more archaic forms shocks everybody, but there is very urgent need that public opinion should be just as severe in condemnation of the vice which hides itself behind class or professional loyalty, or which denies that it is vice if it can escape conviction in the courts. The public and the representatives of the public, the high officials, whether on the bench or in executive or legislative positions, need to remember that often the most dangerous criminals, so far as the life of the nation is concerned, are not those who commit the crimes known to and condemned by the popular conscience for centuries, but those who commit crimes only rendered possible by the complex conditions of our modern industrial life.

"It makes not a particle of difference whether these crimes are committed by a capitalist, or by a laborer, by a leading banker or manufacturer or railroad man, or by a leading representative of a labor union.

Swindling in stocks, corrupting legislatures, making fortunes by the inflation of securities, by wrecking railroads, by destroying competitors through rebates—these forms of wrongdoing in the capitalist are far more infamous than any ordinary form of embezzlement or forgery. Yet it is a matter of extreme difficulty to secure the punishment of the man most guilty of them, most responsible for them."

Just at present we need teaching along the line indicated by the President as badly as we do in higher mathematics and other intellectual studies.

OUR QUIZ.

1. How many titles has King Edward?
2. How many islands constitute Hawaii and how many are inhabited?
3. How many states and territories are there in the Republic of Mexico?
4. What nation owns the largest area in Africa?
5. What is the Congo Free State? When named?
6. To what country do the Fiji Islands belong?
7. Has Great Britain a colony in Central America?
8. Are Australia and Australasia the same?
9. What is a Swiss canton?
10. What is a protectorate?
11. Where are the Low Countries of Europe?

IS IT TRUE?

Is it true, as reported, that the general government has something over \$200,000,000 deposited in the national banks and that it is receiving no interest on this?

Is it also true, as reported, that the government has several hundred million dollars in specie lying idle in its vaults?

Is it true that between these large sums and its current income it has all the money it needs in its business and a surplus besides which can only be represented by nine figures?

Has it any need or any genuine excuse for borrowing money for its own legitimate purposes?

If the government sells bonds bearing 2 per cent interest to the amount of \$50,000,000, is not this the same practically as borrowing that much money at a cost of \$1,000,000 a year, and if it sells certificates of indebtedness bearing 3 per cent interest to the amount of \$100,000,000, is that not equivalent to borrowing so much in money at a cost of \$3,000,000 per year?

Is there any authority in law, or in the legitimate discretion of the officers of the government, for this borrowing when the government has more money on hand than it needs to use?

The above are some of the current questions about the recent financial deal in Washington, D. C.

The Thank Offering

B. C. Whitmore

With the days of every year,
As they come and go with time,
I hail with gladness, to revere
And review memories sublime.
'Tis good to cease our toils and care,
And meditate on whence and where,
Of things enjoyed so rich and rare
In a pure, sweet, wholesome clime.
It's a day I've learned to love,
And cherish with a fondness true;
It makes my soul soar high above
The troubles that my thoughts pursue.

'Tis my heart's contrite expression,
'Tis my soul's deepest impression,
'Tis my life's entire confession,
A pure thank-offering to renew.

Be given, my friends, to prayer,
And in true devotion pray;
With earnest pledge to God repair
Thy gratitude from day to day,
Renew thy covenant with the Lord,
Embrace the promise of his word
And ever live in sweet accord
Till thank-offerings fore'er relay.

Union Bridge, Md.

A Kansas "Pennsylvania Dutch" Home

An Inglenook Reader

ONE Sunday morning I went to the Sunny Plains church, a few miles distant from the village in which I live. The church people who worship here are a plain, unworldly people, of the "Pennsylvania Dutch" stock, and so little changed are they by transplantation on western soil that I could have believed I was with them in their mother state—Pennsylvania.

After the services were over, I was urged by many a good sister to "Go along for dinner," as they always try to have some one share the big meal of the week. I went with Sister Metz. Now every woman of this church is called "Sister," and every man "Brother" or else the surname is used as, "Susan" or "Jacob." "Mrs." or "Mr." being applied only to worldly people.

As our company approached the home of Adam and Sarah Metz I supposed they had not returned, because the shutters of the large, white farmhouse were all tightly closed. Just then Sister Metz appeared in the door of the little house near by in which they lived, (so that they would not make their big house dirty.)

Perhaps I shivered a little as I stepped into the most perfectly clean house I ever saw. Plainness, a principle of their religion, was in evidence here. There

was nothing used just for looks. There were no pictures, except one on a calendar. No books lay invitingly around. There were, however, a few rows of books on the shelves of the "secretary," but I would not have dared to disturb their perfect order.

There was cleanness everywhere—clean carpets, spotless white walls, freshly painted woodwork, glistening windows, a wonderfully shiny stove, and a vast array of polished glass and china ware in the big corner cupboard.

After dinner, the men went out to look at the stock, and the women were invited upstairs to see the quilts. There seemed every possible variety of color and pattern. I remarked that none of these many covers seemed to have been used. "O no," answered the hostess, "I don't yuse em, I chust keep 'em."

Then we were shown the pantry. Jams, jellies, preserves and pickles of all kinds filled a deep cupboard from floor to ceiling. "This comes handy when somebody comes," explained the hostess. I thought people would have to come in crowds to eat so much "spreadins." I decided that the idea of "just keeping" them was back of this display, also.

The cellar came in for its share of glory. Apples, vegetables and meats appeared to be provided for

several families. There was one thing, though, that outdid the rest. It was the canned fruit. No other woman of the neighborhood had so much, I was told.

It was like being at a county fair, so much did things suggest the idea of being on display, and I decided that this must be the premium-taking home of the community. They say Sister Metz has the most chickens, has the best garden, keeps the cleanest house, sets the best table, puts up the most fruit, and as a most surprising climax, does the most outside work of any woman in the neighborhood.

When I came home I ran into our little house, and looked at the fading carpet, worn by all our feet every day. I saw the dear books John and I read in a few rare evenings when the little tots go to bed early. I saw the pictures we love. I picked up the magazine which the little boys had left on the floor after reading the pictures. There were the windows with the marks of Bertie's fingers as he traced his and brother's names. I saw all this, and still I said, "No, indeed, I would not trade."

WHAT TO TEACH A GIRL.

TEACH her that 100 cents make a dollar.

Teach her to wear a calico dress and wear it like a queen.

Teach her to say "No" and stick to it, or "Yes" and mean it.

Teach her to arrange the bedroom as well as the parlor or library.

Teach her to dress for health and comfort as well as for appearance.

Teach her how to darn stockings, sew on buttons and mend a glove.

Teach her to have nothing to do with intemperate or dissolute young men.

Teach her to observe the morals and habits and not money in selecting her associates.

The old rule of "a place for everything and everything in its place."

Teach her to cultivate the talent she has and not waste time and money on the talent she does not possess.

Teach her to embrace every opportunity for reading and to select carefully the books that are elevating in their tone, and above all avoid trashy novels.

MONEY ENGAGED IN NATION'S LIQUOR TRADE.

Amount invested in brewing and distilling business in the United States,	\$612,571,558 00
Internal revenue receipts from taxes paid on liquor business last fiscal year,	207,124,099 00
Increase in revenue receipts over previous year,	16,444,651 00
Other revenue from liquor business paid to United States, city and state governments, yearly,	60,875,465 00
Last yearly production of malt liquors in United States (barrels),	54,651,637

♥ FOR THE COOKS ♥

APPETIZERS.

LENNA FRANCES COOPER.

Director Cooking Department of Battle Creek Sanitarium.

Number One.

WE are accustomed to think of an "appetizer" as some bottled nostrum, bitter and repulsive. We little realize how bountifully Nature has supplied us with these things. Pawlow, the great Russian physiologist has demonstrated conclusively that the appetite plays a very important part in digestion. In his experiments upon dogs, he has shown that when the appetite is awakened, the digestive juices begin to flow almost immediately although no food has yet been eaten. But if food was placed in the stomach by mechanical means so that the dog's appetite was not appealed to, the digestive juices were not secreted for a half hour or so later. Hence, digestion was greatly delayed. He also showed that the appetite may be appealed to in three ways: viz., by the sense of *sight*, by the sense of *smell* and by the sense of *taste*.

It was found that when the dogs were shown something of which they were fond, the digestive juices began to flow although they were not allowed to partake of it; that when they were blindfolded and allowed to smell of something which they liked, the digestive juices also flowed, and the same when they were allowed to taste of food when blindfolded. These experiments all have their counterpart in human experiences. We all know that the odor from a luscious apple or the sight of a beautiful bunch of grapes appeals to our appetite and causes our "mouth to water." This is a literal experience. The saliva of the mouth and the stomach juices actually are secreted when the appetite is thus appealed to.

The practical application of this is that food should be made appetizing, not only to the taste, but also to the sight and smell.

The table and dining room should be the most cheery spots in the house. The table should be arranged as attractively as possible, avoiding a crowded appearance. Cold foods should be served cold, but hot foods should be served *hot*; not only because the taste is better, but because hot foods give off an aroma which appeals to the appetite. The chief value of a soup is as an appetizer, hence they should be served *hot*.

Certainly, foods should be made as tasty as possible. This does not mean that they should be seasoned up with condiments and substances which will obliterate the natural flavors of the foods and irritate the alimentary tract as well. Study to blend foods which will make a pleasing combination.

Fruits as a class are nature's great appetizers. Most

vegetables also contain substances which appeal to the appetite. But even so-called unappetizing foods may be made appetizing by serving properly. Below are a few appetizing dishes:

Tomato Bouillon.

1 cup diced carrots	2 cups strained tomato
1 cup diced turnips	1 teaspoon salt
1 cup chopped celery	1 teaspoon sugar
3 onions (chopped)	2 level tablespoons butter
2 quarts cold water	

Put the carrots, turnips, celery, strained tomato and onions on to cook in the cold water. Let them come slowly to the boiling point and simmer for about two hours or until tender. Then add the salt, sugar and butter. Serve with,

Bread Sticks.

Cut stale bread into one-half inch slices. Cut the slices into strips one-half inch wide and three inches long. Put in a moderate oven and toast until crisp throughout.

Scalloped Corn.

$\frac{1}{4}$ cup butter	$\frac{1}{4}$ cup flour
$\frac{1}{2}$ teaspoon salt	$1\frac{1}{2}$ cup milk
1 pint corn	1 level tablespoon sugar
$\frac{3}{4}$ cup cracker crumbs	$\frac{1}{4}$ cup cream

Mix the butter, and flour together and add the boiling milk, stirring meanwhile. Then add the corn from which the water has been drained, the salt and sugar and let boil for a minute or so. Turn into a baking dish, and cover the top with the crumbs, moistened with the cream and bake 15-20 minutes.

Maple Apples.

6 medium-sized apples	$\frac{3}{4}$ cup Maple syrup
$\frac{3}{4}$ cup water	

Pare and core the apples. Heat the water and syrup to boiling. Drop the apples into the heated liquid, and turn frequently to insure cooking in all parts alike. When soft, remove the apples, taking care to keep them whole. Allow the liquid to cook down to a syrupy consistency and pour over them. A spoonful of whipped cream may be served if desired.

TEDDY BEARS AND BABIES.

AUNT JENNIE.

IN traveling through the city these days you are confronted with little tots carrying Teddy Bears, which cost as much as ten dollars, although some cost many times that. It is time for a word to be said on such an extravagant fad and sinful folly.

Mothers are doing an injustice to their little ones by giving them a BEAR for a toy instead of a DOLL, because it teaches the baby girl or boy to love that which is unnatural. It destroys the motherly instinct which causes the little girl to love her dollie—to make clothes for it as soon as she can sew. Instead of encouraging that noble instinct in little girls, they lose all taste for the natural and develop a desire for

fads. Thus simple, childlike love for the beautiful and natural is lost.

Sister, mother, take care what you are giving your dear ones to play with. After raising a large family I can say that for children to play with dolls makes them more manly and considerate for their companions in years to come.

Orient, Oregon.

PRAYER.

MELVIN DAVISSON.

1. PRAYER is the key to success in Christian living. Without it the child of God can make no progress, and standing still means to retrograde.

2. Prayer is to a Christian what fuel is to fire—without it, either will die.

3. Prayer is not the mere repeating of words, but the desire of the spirit expressed in truth and reality, by words and actions.

4. There are two kinds of prayer—public, and secret. Public prayer too often sounds like the mere saying of words. Christ prayed in public but he always had a purpose at heart, so that when he asked for anything it was just what his soul actually needed. His prayers were short and specific. So let our prayers be such—asking only for absolute necessities and then we will *receive* them. James says: "Ye have not, because ye ask amiss." We seek things for our *own* benefit, while God wants us to honor and glorify him first, and his glory then becomes our glory.

Secret prayer is talking with God, alone, face to face.

Lord, teach us how to pray.

MILLINERY MANEUVERS.

Proud, pretty, but penniless maid,
Permit me to come to your aid;

You want a new hat,

But your trouble is that

Our milliner's bill isn't paid.

You can't wear the thing

You bought in the spring,

Its "nose-tilt" is now incorrect;

For the hat of today

Slants the opposite way,

With a sort of sou'-wester effect.

The shade on the brow must be *stunt*,

The brim being narrow and blunt,

And the trimming's confined

To the wide brim behind,

That used to be worn in the front;

But take courage again;

That hat you disdain,

As the latest creation may score,

If—no doubt you have guessed

What I want to suggest—

You pin it on hind side before.

—Puck.

Some Reasons Why Cuba Has Not Advanced

Grant Mahan

THE thing that is hardest to understand about Cuba is its present condition, so small a part of it being under cultivation. That makes people wonder what the drawbacks are. The main reason, it seems to me, for the present-day backwardness was Spanish misrule, which must be held responsible for the illiteracy of the people and their lack of energy. Then, of course, there is the climate. Men do not have to work so hard for a living and therefore they don't. Necessity must be thanked for a good many things which we consider praiseworthy.

A look at some of the implements used by those who cultivate the soil is enough to show how unprogressive the people are. Take their plow, which Americans call the "soil tickler," for it does little more than tickle the soil. What can be expected from such a tool? What would be the result if such implements were used by farmers in the most fertile parts of Illinois and Iowa? We should not have such good houses and barns, and

many other things which go to make the American farmer what he is, and his family what they are, would be lacking. It is clearly a lack of enterprise here, and for this the people are not wholly, or even mostly, to blame. Their government discouraged and crushed,

THE SOIL TICKLER.

MODERN CANE PLANTING; PLACING THE SEED CANE.

Courtesy of the Cuban Review and Bulletin, New York City.

rather than fostered, enterprise. We who were born and have spent our lives in the States find it hard to appreciate the situation without coming and seeing for ourselves.

But American intervention threw off the Spanish yoke, and American money and push are today ushering in the better things, the more up-to-date methods and implements, and the results are already becoming visible. And this is but the beginning. We cannot see into the future and tell what changes a few years will bring forth, but we be-

lieve they will be for the better. We have an abiding faith in the ability and persistence of the American people to accomplish that which they undertake; and they have undertaken to lift Cuba to the position which she should occupy in the world. And today we are seeing the best modern plows take the place of the soil tickler. Other things might be mentioned.

Cane has been and is one of the main crops raised by the Cubans. But their old method of the ox-cart bringing the seed cane and dumping it beside the rows, to be carried in and covered by hand work, is giving way to the more modern method of the mule carrying the cane, with a man on each side to lay it in the rows, where it is covered by a disk cultivator. The work is done in about one-third the time required by the older method.

Much more might be said about the superiority of our methods over those of the people among whom we are sojourning. But this is enough. Conditions here show how great a part good government plays in the prosperity of the people governed. Cuba needs a much wiser rule than that of the past; she needs better schools, better homes, better fathers and mothers, better and more religious teaching than the past has seen. Will she have these things? Most assuredly, if the American people live up to their opportunity and responsibility. We are not urging them to come here, but to think in what ways they may help—by prayer, by money to send religious teachers; for Cuba is included in the "all nations" of the great commission.

Omaja, Cuba.

CARING FOR THE BIRDS.

Boys and girls in many neighborhoods have formed themselves into clubs for taking care of the birds in winter, that they may not starve or freeze to death, as many do, if unaided, in severe weather. Committees are appointed, same to take charge of obtaining bird feed or money with which to buy it. Farmers, grain dealers and butchers are usually willing to contribute generously of grain, refuse meat and suet, or to sell these at cost; while few will refuse a small sum with which to buy them. The big boys are best fitted for the actual work of distribution.

Forming themselves into squads of three or four, with snow shovels and bags, they meet at a central place where the food is stored, and provide themselves with grain, meat or suet, and plenty of string, with which to tie the latter to a conspicuous place on a tree, with the string wound round and round the suet to form a net, or else with netting tied over it, so that a greedy squirrel, crow, sparrow or jaybird shall not carry it off bodily.

As a rule, the grain is spread in the middle of open fields, where it can be seen by birds flying over. The boys clear a space from ten to twenty feet square and scatter the grain; then make other similar feeding stations farther on. Of course, it is discouraging to find the seed scattered one afternoon covered up again by snow next morning; but if the exact spot cannot be uncovered, plucky boys will do their work over again.

Shelter should also be provided, that the birds may not be like the beggar to whom the doctor gave an appetizer without providing the food to satisfy the appetite. Bean poles with vines attached can be piled to form a wigwam, or cornstalks may be stacked on either side of a fence and provide shelter and feeding place at the same time. But these should have apparent ingress and egress, so as not to cause suspicion of being a trap.—Dumb Animals.

THE WATER LILY.

LEON F. BEERY.

OUT in a barren field, in a small pond, on the banks of which grew all kinds of grasses and weeds, and whose bottom was covered with sticks and stones and slime, a water lily was born into the world. It was so small and so tender that it seemed as if it would perish in that filthy place, at the bottom of the stagnant pool.

The stones put themselves in its way, and almost choked the life out of it. The sticks made a disagreeable network through which it had to work its weary way. It became all covered with the slime, and the tadpoles and other inhabitants of the pond stirred up the mud in the water so that the little lily could not see out into the light.

It felt as if it were being punished too severely, and that it could hardly live, but it took fresh courage, and grew the best it could. Many a hard time it passed through, and many a time it was on the point of giving up all hope, but it kept plodding on and on, for it knew within its little self that some end must come, whether good or bad.

As a result of its growing it kept getting nearer to the surface until one day in the beautiful summer, when the birds were singing their sweetest carols, and the trees and all other plants and shrubs had their best summer suits on, and the whole earth seemed one vast Eden, and the blue sky above, a great roof and protection over all, this little insignificant water lily thrust its head out of the water up into the light of day.

It was now happy, and it had good reason, for soon it opened, and spread its large leaves out on the water, which caused them to wave up and down, and its beautiful white petals, with the exquisite center of pure gold, attracted the attention of many passers-by, who said, "See, what a beautiful flower that lily is!"

"If what shines afar so grand
Turns to nothing in thy hand,
On again! The virtue lies
In the struggle, not the prize."

Huntingdon, Pa.

WHOSE HEAD WAS HURT?

THE story is told of a colored man who, having been hit on the head by a falling brick, recovered \$2,000 in damages from the party responsible. When, however, the colored man's lawyer handed him \$700 of the award and put the other \$1,300 into his own pocket, his client asked, "Say, boss, whose head was hurt with that brick, yours or mine?" In like spirit the farmer who is being made the victim of the grain gamblers, and who finds it difficult to arrive at the real market value of his products, may well ask, "Who owns the farm, anyway?"

The Baby.--No. 2

Catharine Beery-Van Dyke

THE Baby!
The dear little creature we looked for so long! *Our Baby!* A new member of *our own family!* We used to number six, now we are seven, or there used to be two of us, now there are three. And the new member is so *little*—so dainty—so sweet. Helpless, of course, but so appealing in his inability to care for himself.

Oh, the world can never be utterly desolate now since God has given us a chance to cultivate even one little flower for the beautiful fields of heaven. Hope may flicker and burn low, but it will never go out since through us God has brought one more soul into existence to shine for him eternally!

And oh, the many temptations and sins from which this little one will beguile us! Temptations of unfaithfulness, idleness, disloyalty—sins of pure and extreme selfishness!

How many times will hope burst forth anew and faith be confirmed at sight and in touch of this new, purely dependent life for which we are responsible!

The baby? Ah, I have heard a mother say, "And

now the Devil's to pay. With his squalling and his colic, his washing and his dressing, and his keeping me at home from every place I want to go; there was work enough before, and my heart now drops full sore to think of all the worry and the trouble and the bother I must know."

Having fought against the advent of the "new member" as far as it was lawful (?) and possibly farther—nothing remains but to make the best—or perhaps the worst—of the situation.

Reader, have you ever been impressed with the dual nature of this contract? The one is assuming and accepting the laws of nature and of nature's God; receiving in an appreciative, philosophical, common-sense way, the highest gift, the most

sacred power and responsibility that God has offered to man.

The other is a part of the "Devil's pay" in the beginning.

The one is spiritual; the other is carnal.

Let us strike out of the picture the second condi-

ON CHRISTMAS EVE

Sleep well, my dear ones, safe and free;
The holy angels are with thee,
Who always see thy Father's face,
And never slumber, nights nor days.

Your bed is soft in every way;
The Saviour lay in straw and hay;

Your chamber is far better drest
Than the hard crib where He did rest.

None dare disturb your quiet ease;
He had a thousand enemies.
You live in sweet security;
But He was punished, and for thee

Adapted from the German of John Christian Jacobi.

tion and give the dear baby our unprejudiced consideration.

In Jerome K. Jerome's chapter on Babies in his "Idle Thoughts of an Idle Fellow" there are some hints on the subject that are next to inspiring.

Aside from its being a welcome, beloved, little bundle of humanity there is a deeper significance hid in the little life. This is his inevitable development and the way in which it is directed.

While much depends upon the physical care of the infant—its food, clothing, etc., the fact is it possesses soul and intellect as well as a body and these, too, may early be taken account of by the thoughtful mother.

Dr. Griffith says: "When a baby is just born, and during the first few days of life it is very little more intelligent than a vegetable." And yet it is possible to train the child almost from its entrance into the world. For instance, about all a real young baby needs for some weeks is to be kept clean, comfortably warm, its stomach comfortably full and then to be let alone.

If this course is followed until the child is old enough to need greater freedom and encouragement to exercise both body and mind, all other things being equal, the child will be normal, unspoiled.

Now, while it is easy to make such statements, the method to reach these ends must also be simple and scientific.

Its bathing and its changing must be regularly done; the extremes of heat and cold must be avoided; and

above all, the feeding must be done at proper, regular hours, and in sensible quantities.

Just a word or two about feeding and bathing the infant, then the rest on that subject will be left to the doctor.

I have known mothers, and so have you, who do not pretend to observe any regularity in time for feeding their offspring. Their rule seems to be: "When

he cries, nurse him and get him quiet," thus passing the reins of government into the hands of the youngest, long before he is of age, and consequently establishing a state of anarchy in the very heart of the family and sowing the seeds of rebellion and insubordination in the mind of this child which will require most of his lifetime to subdue.

Whatever conduces to the child's physical equilibrium tends also to the normal and steady development of its intellect. Therefore, I give this hint to mothers who nurse their babies: Keep as even tempered as you can and never nurse your

child while in a state of over-heat either from grief, over-work, anger or worry, for these states poison your milk and you subject your child to sickness, or even death, and retard his normal development.

At bathing time is offered a splendid opportunity to test and encourage the physical and mental growth of the child. A word from my own experience. With my last three babies I used the cook table as their bathing board. It was in the kitchen where it was warm and away from draught. Covering the table with a soft comfort and this with a bathing blanket

I proceeded to stretch them out upon it. I talked to them during the process and they were usually in a pleasant state of mind. When the bath was over and they were partly dressed, but with hands and feet free from outer garments, I put their little palms against my own and while I moved them back to their shoulders and forth again I sang to a simple tune, these words:

"All about, all about
Baby's hands are flying;
Press them here, Baby dear,
While your strength you're trying."

Then the feet the same way, bending the knees back to the abdomen and stretching them down again as far as possible, singing "Little feet are flying."

The child is quite young when he is able to appreciate this little performance in which he has almost a conscious part.

One of my little boys, when about six months old, was lying on the couch awake in a room alone. As I passed through the room I sang cheerily: "All about, all about." He evidently recognized the song for he laughed aloud with joy.

I tell this to show you that little, tiny babies can be trained to enjoy and to respond to attentions given them. It was recently asked: "When should the training of a child to obey begin?" Would not this be a good time?

Then, too, sanitary habits can be formed much earlier than many mothers have imagined. Commence at four weeks, mothers, and by patient, persevering efforts for a week you will be surprised and delighted at the results. This teaches the child self-control and for this exercise alone it pays the mother a hundredfold and is of untold value to the child.
Chicago.

OLD SANTA.

SNOW MAHORNEY.

Old Santa and wife had worked the year through,
Preparing for Christmas, the toys bright and new;
Now Santa at last, with pack and his sleigh,
Started out with his deers and rode fast away.

The snow thickly lay, all around, on the ground,
And the reindeer sped forth, with a leap and a bound;
The bell's merry jingle, rang with good cheer,
And spoke forth to all, "Merry Christmas is here."

And then a white house-top, at last Santa spied,
And quickly climbed up, his pack to divide:
He made the poor happy, left something for all;
Then out on the house-top, again did he crawl.

A word to the reindeer, then quickly away,
Went Santa, with empty pack, home in his sleigh;
Now Santa's good wife loved the dear jolly man,
And fixes him presents, as nice as she can.

Then peacefully went to her room to retire,
And left Santa's presents, before the bright fire.
When old Santa entered, he shook his grey head,
And snatching them up, for his reindeers he sped.

And whistling loud, again o'er the snows,
The reindeers sped forth, the things to dispose;
And anxious old Santa, urged on with good will,
The fast fleeting reindeer, till they climbed the last hill.

The grey dawn was peeping, on the glad Christmas day,
Santa left the last bundle, and rode fast away:
Once more at his own home, he opened the door,
And soon was asleep and beginning to snore.

At last he awoke, went his dear wife to find
And tell her the joke, of the things left behind;
With a queer sort of smile, she heard him all through,
Then answered, "Why Santa, I left them for you."

His eyes opened wide, his white beard he stroked,
Then burst out laughing, at such a good joke.
Dear Santa, so happy in giving you see,
Thought not of himself, as sometimes do we.
Lodoga, Ind.

OVERLOOKED PURPOSE OF THE SABBATH.

RICHARD BRAUNSTEIN.

It is commonly thought that the purposes of the Sabbath are covered by two words, namely *worship* and *rest*. There are two other purposes less thought of, but hardly less important.

One of them is that aspect of the Sabbath which Christ chiefly emphasized, the opportunities such a day affords for *doing* good. "It is lawful," he said—that is, it is the law—"to do good on the Sabbath days."

The Pharisaic Sabbath was full of *rules* but not *doing*. Christ sets his face against the idea that idleness can be true Sabbath-keeping. Not doing nothing, but doing good, is Christian observance of Sunday. "My Father worketh hitherto and I work" said Jesus profoundly, when chided for healing a man on the Sabbath, which was forbidden, not by the Bible, but by the fossil code of the Pharisees, by which he meant that divine work is to be done all days.

It is only selfish work that is to cease one day in the week to give those who otherwise would be cut off from divine work an opportunity to engage in it. Rest, not idleness, but by change from the selfish work for money to unselfish works of mercy, is the true Sabbath rest—a truth to which thousands of Christians today are as blind as the Pharisees.

"Divine service" is the very heart of the Sabbath—by which it is not meant going to church. The very fact that worship, a *preparation for service* is called "service," prevents some people from seeing that they are giving God no real service unless they go from meetings, as a servant from meals, to some real work for God.

What would be thought of a farm hand's counting himself good and faithful because he was always present at mealtime? Every preacher should put emphasis where Christ did, that lazy Christians who spend the day in sleeping and shirking, rendering no help in the Sunday school, doing little for their

own children, may be made to feel that they are Sabbath-breakers. And every teacher should see that none of his pupils grow up with the false ideas that make such misconceptions possible.

But there is another purpose of the Sabbath, brought out clearly in that statement of the Sabbath law, Isaiah 58: 13, 14, namely, to wean us from selfishness. This is important to us as individuals, but especially as members of the acquisitive Anglo-Saxon race which, with all its passion for money, could never have maintained its humanities if it had not been halted in selfish pursuits by a divine voice one day in every week. The heathen races are in less need of the Sabbath. They rest too much already. They break the commandment in its first requirement: "Six days shalt thou labor." They are Esaus preferring present ease and indulgence to future wealth at the cost of self-denial and strenuous endeavor. But Anglo-Saxon are Jacobs; their love of money would certainly become undisputed master, but for the Sabbath's reinforcement, every week, of their love for man. But for centuries of Sabbaths our war for humanity would have been, if not impossible, very much hindered.

It is, therefore, a matter of great concern to the intelligent patriot, as well as to the Christian, that we are allowing the Sabbath to be changed into the "Holiday Sunday," which cannot but have deadly influence upon our own and national characters.

This change is already occurring before our eyes in some of our cities. Let us resist it in season. Let us especially see that we be not found among those who shall break down the Christian national institutions our fathers bequeathed to us. The test of a Sunday wheel is not the question, "Will it harm me?" The bicycle brigade is the advance line of the invading Continental army that is destroying American institutions. There is, of course, no objection in the using the wheel for doing good, and if we are busy at that every Sabbath, we shall have little disposition to seek doubtful indulgences.

WHAT IS WRONG, BOYS?

Two men buy a dressed hog, weighing 200 pounds, at 5 cents a pound. This amounts to \$10.00, and each man contributed \$5.00. One then proposed that he take the shoulder of the hog, paying for it 4 cents a pound, and that the other take the ham end, paying 6 cents a pound. To this they agreed and the question arose as to how many pounds each should take to secure his \$5.00 worth of the hog. This looks easy, as the price per pound each was to pay was agreed to. Divide \$5.00 by 4 and you get 125. Divide the other, \$5.00 by 6 and you get 83 1-3. But add 125 to 83 1-3 and you have a total of 208 1-3 pounds, while there was only 200 pounds of pork. Try again:

The man who pays 4 cents a pound seems clearly entitled to six-tenths of the hog, which is 120 pounds. The other man would get four-tenths of the hog, which is 80 pounds. That makes a total of 200 pounds, just what the hog weighs. But when we divide \$5.00 by either the 80 or the 120 pounds we find each man is paying more than the price agreed for his pork. Where is the trouble, and how do you find the correct answer?

WHAT IS A "WHITE" PERSON?

CONGRESS has power under the constitution to lay down uniform requirements for the naturalization of immigrants as citizens, though the immediate enforcement of the process is left to the states. The original act of 1790 gave the privilege of citizenship to all "free white aliens," and that classification has stuck—though in a few isolated instances, as in the case of the Hawaiians, it has been specially enlarged to include people not white. The privilege of the voting franchise is entirely distinct from that of general citizenship, and each state decides what classes of residents it shall allow to vote.

BIG INSURANCE ON HANDS, THROAT AND ANKLES.

If you had a fine voice, or a nimble pair of feet, or a dexterous fine-trained hand and you made big money out of it, would you insure the precious money-making part of your body?

Now, there's Kubelik, the wonderful violin virtuoso. He pays premiums on a \$50,000 policy for his magical right hand, the hand that extracts such melody from his aged Strad.

Paderewski, the long-haired master of the piano, has his wonderful hands insured for \$45,000, and in case he injured either, could manage to eke out a scanty existence until the bones knit.

M. Carolus Duran, the great French painter, has his eyes insured for \$30,000. Should he lose his sight and no longer be able to assemble wonderful colors, the money will help some.

La Belle Otero, the Spanish dancer, has her money-making ankles insured for \$80,000 each. And each toe upon her little feet is insured for \$15,000.

Mme Lina Cavalieri, most beautiful of European women, carries a policy for \$50,000 upon her throat, from which comes the melody that enraptures thousands.

UNDISPUTED.

FIRST LAWYER—"You are a shyster!"

His Opponent—"And you are a blackguard!"

The Court—"Now, gentlemen, let us take up the *disputed* points in the case."—*Philadelphia North American*.

CREAM OF MAGAZINES

"WHAT'S THE MATTER WITH AMERICA?"

A nation of 80,000,000 villagers which is incapable of developing beyond the village stage, or even making as good a job of that as a handful of Russians would with their Mir traditions; which has a morbidly democratic constitution because it mistrusts its Government even more than it mistrusts its people; which is too big to be conquered by an European Power; and which, when the natural law of economic rent begins to operate on a huge scale, cannot form a government strong enough to socialize it, must fall helplessly into the hands of its exploiters and bosses, and outface its disgrace by tall talk as best it may.

President Roosevelt cannot realize his dream of making America a real national organism, sovereign over all anti-social powers within its own frontiers, and forcing all men to climb to prosperity instead of rooting for it as hogs root for truffles. Already it is obvious that the President is trying to redeem the United States solely because a man must assume that things can be bettered, or else lie down and die of despair. The Socialists, as voiced by Mr. Upton Sinclair, hope still more desperately that Capitalism will break down for want of markets, and that Socialism will step in and build on the ruins: a very mad hope indeed, because, first, Capitalism is not in the smallest danger of any such breakdown, and suffers much less from temporary crisis than it did a century ago, when this discredited prophecy began to be bandied about; and, second, Socialism is only possible as the consummation of successful Capitalism, which, with all its horrors, will be adored by history as the pathfinder of Socialism and the ruthless reducer to absurdity of village Unsociatism.

No; things in America will have to get worse before they get better. Socialism is the remedy; but Socialism is only possible where Individualism is developed to the point at which the individual can see beyond himself and works to perfect his city and his nation instead of to furnish his own house better than his neighbor's. Short of that point Individualism is not Individualism, but Idiocy (a word which idiots cannot understand), and Idiocy and nothing else is just what is the matter with America today.

America has never been successful in politics. It was made independent largely in spite of its own teeth by a declaration of sentiments which it did not share and principles which it barely grasped the narrow end of. Even today neither its ordinary security nor its liberty is up to the monarchical standard of Central Europe. The famous Constitution survives only because whenever any corner of it gets into the way of the accumulating dollar it is pettishly knocked off and thrown away. Every social development, however beneficial and inevitable from the public point of view, is met, not by an intelligent adaptation of the social structure to its novelties, but by a panic and a cry of "go back." An unfortunate President struggling to get things looked at from the point of view of the collective interest of the United States, which is so huge a thing that it must be coordinated with the collective interest of all civilization if it is to be made workable, finds himself appreciated solely as the hero of a dime novel—Teddy the Rough Rider—and would enhance his popularity by punching a prize-fighter's head as surely as he would lose it by telling the American people what he must think of their political capacity.

Eighteen years ago the London Fabian Society, in a book entitled "Fabian Essays," called attention to the Trust development in American industry and explained its significance. The writer of the essay directed to this point, the late William Clarke, had no idea that there was anything recondite in the industrial phenomenon he dealt with, or that the existence and operations of the Standard

Oil Trust were a terrible discovery of his own. The facts were not new to me, nor to any of the writers with whom I was associated as editor of the essays. What Clarke, though he had traveled and lectured in America, did not fully realize, was the stupendous denseness of the Americans' ignorance of their own country—the childishness which enables them to remain simple New England villagers in the complicated hustle of New York and Chicago, never revising their ideas, never enlarging their consciousness, never losing their interest in the ideals of the Pilgrim Fathers. A year or two ago, however, it suddenly occurred to them that the village shopkeeper was in difficulties. To their sympathetic inquiries he replied that "the Trust" was to blame. And so the simple villagers said: "How wicked! let us put the Trust in the stocks at once." And that is what they are trying to do at present, not having yet noticed that the Trust is too strong, the stocks too small, and Standard Oil none the dearer or harder to get.—Everybody's.

ABORIGINES OF SOUTH AMERICA.

A trip among the so-called Indians of South America by W. A. Cook partly in the interest of the Bureau of American Ethnology is described in a recent publication of the Smithsonian Institution, entitled "The Bororo Indians of Matto Grosso, Brazil."

Mr. Cook describes his journey through the wilderness to a rough ranch belonging to Senor de Carvalho near a Bororo village. He gives the following account of the Indians:

"The long, straight, coarse black hair of both males and females hangs in a tangled mass about their shoulders, except above the forehead where it is kept chopped off to form bangs. Nearly all the single young plaster these bangs with a sort of red putty made from the small yellowish-red fruit of the burity palm and fish oil, and the same paste is used to paint the entire body.

"Boys and girls who are esteemed by their parents also have the foretop arranged in this way, and a few of the latter who are regarded with special favor have it plaited with a layer of beautiful red feathers. One woman was covered with white feathers from head to foot, with a brilliant plume in her hair.

"All young men and boys wear suspended from a hole in the lip, bored during infancy, a kind of chain called nogodau, about six inches long, made of flat oval-shaped bits of shell, terminating in a red feather. The older men have a plug in this hole, for if left open it causes difficulty in drinking.

"There were thirty huts in the village that encircled in a very irregular way, facing in every direction, a very large hut that stood in the center and was called baehytu. Bae (by) is the name of the ordinary family hut.

"This baehytu is the bachelor's hall, the headquarters of all the unmarried men, the workshop where the men make weapons and ornaments and instruments, the dining-room, the town hall where most public functions occur, and the club where visitors are received and entertained. The baehytu is entered through an opening at each end like a hole in a haystack, and within is always damp, gloomy and foul-smelling.

"The family huts are mostly like a roof resting on the ground and strongly resemble an old haystack with a hole eaten in each end, though occasionally the hut is raised a little and woven palm branch tongues form a basketlike wall. Deep gloom reigns within these huts. They are made dark that they may be free from flies, and are dens of rubbish and filth.

"The occupants of this human lair are sprawled on a palm-leaf rug, with a log of wood four inches in diameter

for a pillow, and sleeping or gnawing an ear of corn, a bit of fish or vegetable, or sitting tailor fashion making beads, arrows or other objects, or kneeling by the little fire preparing food. When the filth becomes unbearable or disease is prevalent they do not trouble to clean house, but simply abandon and burn the old and build a new one on a clean spot. Usually the entire village moves to a new place some distance away.

"A day or so after our arrival a child of seven or eight years belonging to one of the leading families died. This gave us an opportunity to witness a strange ceremony.

"A loud, deep, prolonged hee-aw, ho-o, ah-h, was belated by a quartette of naked, painted and feathered savages, squatting slightly in unison with each note, and shaking hugh calabash rattles. This was accompanied by the wailing chant of a chorus of women standing just behind the quartette and waving fans to keep away the flies.

"The snort of two huge flutes, the barking of the calabash trumpets, the lament of the savage mother, her body besmeared with her own blood, kneeling by the corpse of her child, the hairs jerked from her head, half a dozen at a time, by a female crouched behind her, the lamentations of the father, with his hair clipped, as he knelt on the other side of the body and recited the virtues of the deceased loved one, and the low mournful chant of the female relatives or friends as they lashed their legs and arms, or even their entire bodies, with sharpened shells—this was the drama that unfolded itself one beautiful summer morning as we crept into the baehytu of the Ta-Dare-Mano Paro village. The little daughter of the chief had been summoned from her earthly bae to wander with the bope (evil spirits), and the funeral ceremonies were in progress.

"When a Bororo is ill, a priest is called to determine whether he will recover or die. On entering the hut and looking at his sick tribesman and concluding that he will probably die or should die, he will count his fingers, and each time he touches one finger will repeat, 'Meri, meri, meri, meri, bi,' meaning that the man will see five suns, five days, and die; or he may say: 'Nadua, nadua, nadua, etc., by,' meaning sleep, sleep, etc., five days, and die.

"If at the end of this time he still lives, the executioner, sent, of course, by the priest, will suddenly appear in the hut, sit astride his stomach and strangle him to death, for the reputation of the priest must be sustained. The priests are probably responsible for not a few deaths.

"They are the bane of life in the tribe. They must nurture the delusion that they can communicate with and have influence in the other world and power to avert or cause evils and calamities. They are, therefore, on the alert to take advantage of any propitious occasions to prey upon the superstitious fears of their fellow-tribesmen. They are freely supplied with food by their fellow-tribesmen in order to retain their good will.

"Bope means spirit or disembodied soul, but they seem to have no idea of a good spirit. The bope, who are evil spirits, must therefore not be offended, although they must be driven away.

"To drive the spirits off they use a bull roarer, a peculiar instrument made of a slab of wood about half an inch thick, shaped something like a fish, and of varying size, hung by a long cord from the end of a stick like a fishing rod, and swung round and round through the air. As it swings and rapidly revolves, it sends forth loud sounds to a surprising distance, pitched from a sepulchral moan to an unearthly shriek, the wail rising and descending the scale according to the rapidity of the swing or the size of the instrument. To hear several of these roarers at once certainly produces most unusual sensations, particularly when operated, as we heard them, during a tropical storm amid the play of lightning, the crash and roar of thunder, the falling floods and dismal gloom.

"No female is allowed to see this instrument under pain of death. Now ones are made as occasion demands, and they are burned immediately after their need has passed.

"Certain warning calls are given some hours in advance of the time for bringing the roarers into use and, hearing these warnings, the females enter their huts, close the openings and hide their heads. The roarers are manipulated outside the village up and down through the brush.

"The Bororos are expert swimmers and are fishermen

of the highest order. One mode of fishing is to swim out into the river three or four miles above the village with a net called buke, like a great bag, its mouth secured to two parallel rods nine to twelve feet long, bound together at their ends.

"When one or more fish are seen the mouth of the sack is opened by springing the rods apart and with wonderful dexterity the fish are bagged and the mouth of the net quickly closed by allowing the rods to spring together. The fisherman then plays the game, especially if it be large, gradually rolls the net over the rods till the fish cannot move, brings it to the surface and kills it with a club, which he trails by a cord from his neck. The fish is now taken from the net, strung on a cord and floated along with the club.

"Sometimes two or more fish of twelve or fifteen pounds will be taken at one catch or maybe one weighing as much as the man himself will be bagged in this way. A Bororo will remain in the water an hour or two continuously, and return ashore with six or eight large fish.

"The Bororos are wonderful whistlers, and seem able thus to communicate whatever they otherwise would by speech.

"The Bororos are the tallest of any South American Indians I have seen. I do not remember one man under five feet seven inches, and they are sometimes six feet three or four inches tall. They are full-faced, the nose well shaped and not large or particularly flat nor are the cheek bones especially prominent. Many of the children and some of the young men are quite handsome.

"The tribe is supposed to number between 5,000 and 10,000 souls. We visited eight villages and settlements."

—Los Angeles Times.

TOO MUCH WALL-STREET CONTROL.

With the tendency to do business in the large way, there has been a corresponding tendency to center the control of business in New York. The amalgamation of railroads into large systems has brought the control of transportation into Wall Street. The oil business, the sugar business, the steel business, the tobacco business, and a great many other leading industries are practically controlled from offices located in the financial district of New York City. The chief insurance companies of the country, with their assets reaching into the hundreds of millions of dollars, have their headquarters in that same financial district. The great insurance companies, railroad companies, and industrial companies are now controlled by a set of men who also control the great banks and trust companies of New York City. It is easy to see, therefore, when one stops to reflect, how anything that tends to throw distrust upon the management of one of these sets of interests must affect other sets of interest in the public mind. The insurance investigations in New York played their part in awakening distrust, whether well-founded or ill-founded. Certain railroad investigations also had similar effects. Disclosures in the recent investigation of street railroad interests in New York City had also their measure of influence in arousing a feeling of distrust. This distrust played its part in keeping investors away from Wall Street, and thus the actual shortage of capital was increased by artificial causes. The companies that were extending telephone systems and other facilities could no longer market their bonds, and so they ceased to buy supplies, especially copper. Then followed the sensational drop in the market price of copper, causing a collapse in the market for copper mining stocks and affecting very directly certain banks and trust companies which had been supporting copper interests. It is needless to follow the ramifications that ensue. When all sorts of enterprises seem prosperous and their shares have a high quotation in the stock market, the banks and trust companies are in danger of assuming that there can be no end to flush times, and that these stocks are all safe security for loans of money. And there is a special danger that the officers of banks and trust companies will take this roseate view,—if it happens, as is the case in New York, that the same set of men are acting as the promoters of industrial and mining enterprises, and as the directors in such companies, who are also the directors and officers of the banks and trust companies. Under such circumstances, when an industrial collapse or two occurs, there is almost sure to be disclosed some weak point in a bank or trust company.—Review of Reviews

Echoes from Everywhere

FOREIGN.

The success of the gas plant at Beatrice, Nebr., where good illuminating gas is made from corncobs, cornstalks and other dry farm refuse, has inspired promoters in the Canadian Northwest to establish similar gas plants at Strathcona, Wetaskiwin, and Portage la Prairie, in which straw is utilized.

It has been demonstrated that every ton of straw can be made to yield 15,000 feet of gas, while the best Pennsylvania coal, costing on the spot \$12 a ton, yields only 12,000 feet.

The significance of this comparison can be better appreciated when it is stated that thousands of tons of straw have been burned in northwestern Canada every year to get it out of the way.

Announcement is made by the provincial government that the Bell telephone system in Manitoba has been purchased by the government. The price paid was \$3,300,000. The government will assume control Jan. 15, and the system will be operated by a commission. The present officials of the company probably will be retained.

The trial of the 169 members of the first duma who signed the Viborg manifesto has been concluded. One hundred and sixty-seven of them were convicted and sentenced to three months' imprisonment, while two were acquitted on the ground that they had signed under misapprehension. The sentence carries with it the loss of all political rights and withdraws from Russian politics the foremost liberal leaders in the constitutional movement for several decades, among them being Ivan Petrunkevich, who framed the first demand on the emperor for a constitution.

Ten miles from Baku, near the shores of the Caspian Sea, stood the ancient temple, dedicated of old to fire worship. Within the last few weeks an oil "gusher" has been opened on the site. The discovery of the well suggests that the "eternal flames" that burned at the altar of the temple were maintained by natural gas issuing from the ground. According to geologists, the same oil stratum must include the so-called "Sacred Isle," where Zoroaster, about 400 years before Christ, preached the fire cult. But not only is the discovery historically interesting, it is economically important, for there is a reason to think that the new region will prove forty times as large as the present Baku fields.

The Indian National Congress must be first cousin to the Austrian Parliament. The Hindus, who meet each year to consider their national problems, this year discussed home rule for India. There were two factions, the Extremists, who desire the speedy establishment of complete home rule, and the Moderates, who believe in going slow. Friction between the two parties developed early, and on the second day of the Congress the session degenerated into a free fight, in which chairs and table legs and other pieces of the scattered furniture became the principal arguments. All this seems to argue that the Hindus are thoroughly interested in the question.

GENERAL.

The recent panic has developed an army of 60,000 hungry people in Chicago. Measures have been taken to give partial employment to some of them, while others will be cared for by charitable societies until they can find work. The condition in eastern cities is worse than what

it is in Chicago. In New York City thousands of unemployed people have been set out on the streets by the landlords of tenement houses, because the monthly rent was not paid. Five thousand of these tenement dwellers recently paraded through the city, holding meetings on the street corners until scattered by the police.

They are preparing for another demonstration in which over 100,000 poor people will take part. Rural people and others with plenty to eat and wear know very little about the pauperism of our larger cities, which increases with the years.

The Northwestern Railroad is going dry. Twenty-five thousand employes of that system signed the pledge that has been circulated for signatures during December. A large majority of the employes of the entire system will be teetotalers. Not content with this, the leaders of the movement hope soon to have every man employed from end to end of the 7,000 miles of road a signer of the pledge.

The year 1907 must ever be memorable in the history of the development of electric traction, because of the notable installations which have been made on three of the leading railroad systems of the United States—the New York Central and Hudson River Railroad Company, the New Haven system and the Rochester division of the Erie Railroad. The same season, also, saw the inauguration of electric operation on forty-four miles of the West Shore steam railroad between Utica and Syracuse, the system used being the direct-current with the third rail, and the equipment being in general similar to that of the New York Central terminal lines, with the important exception that the multiple unit system is used throughout. The Erie electrification is of the same general character as that of the New Haven road. A working pressure of 11,000 volts is used on the trolley line, the current being transmitted at the high pressure of 60,000 volts. The overhead construction is much simpler than that employed on the four tracks of the New Haven road.

Minnesota is evidently freeing herself from the yoke of partisanship. Although a Republican state by a strong majority, she has a Democratic governor of whom she is very proud; but she is also proud of her Republican Attorney General, E. T. Young. Mr. Young attracted a great deal of attention by his persistent efforts to enforce the state laws against the railroads, and especially by laying himself liable to contempt of court in the discharge of his duty. His case is now under consideration of the U. S. Supreme Court. He is the man most talked of for governor at present and if he wins his case, the movement to elect him will be irresistible.

William Whyte, vice-president of the Canadian Pacific Railroad, predicts good times ahead. He says that the banks of Canada are strong but after the flurry on this side, they would not loan money on anything of a speculative nature. He reports much talk about the Hudson Bay Railroad, but expresses some doubt of the value of that as a good route for grain from the Northwest to Europe. Much of the grain does not get on the market before Hudson Bay freezes. To store the grain over winter will entail some expense.

At Lewistown, Mont., a number of farmers are trying a new coöperative movement. They have rented a mill, hired a miller, and contributed grain for flour milling. It is their hope to be able to get a better price for their wheat by grinding it and selling the flour.

The U. S. Supreme Court has recently decided a case appealed from the Minnesota Supreme Court, that is of interest to all students of our judicial system. It is that of a Minneapolis saloonkeeper, who was fined \$25 for keeping his saloon open on Sunday, but appealed the case because he was not allowed a jury trial. The decision is that persons violating the city ordinances of Minneapolis, and presumably of other cities, are not entitled to a jury trial.

Minneapolis is to have a Civic Federation which is to have as an avowed object the enforcement of laws "designed to safeguard the public health and morals." This is being organized by the Civic Righteousness Committee of the Federation of Churches of the City of Minneapolis.

Suit has been brought by Attorney-General Young of Minnesota against the Standard Oil Co., to secure cancellation of the company's license to do business in the state. It is charged that the company has sold oil at from 1½ to 3 cents less per gallon in Minneapolis and St. Paul, where there is competition, than in other towns where there is not. This is in disobedience to a law passed in 1907.

One of the largest heating plants in Minneapolis is to be used by the Woman's Club in smoke prevention experiments. They will have complete control of the firemen, and they will be given any kind of fuel they ask.

The completion of the Cuban census marks one important step preliminary to the resumption of native government in the island. The figures show a remarkably rapid growth amounting to twenty per cent, since 1899, due in part, of course, to a considerable immigration. The present population is 2,028,282. Just at present most of the news from the Island is good. The President's expression of hope that in the next twelve months Cuba might set up its own government again, was received very well. The railroad strike, to combat which, it was alleged, men were imported from this country, is practically at an end. Not a case of yellow fever was reported through the length and breadth of Cuba in December, and the quarantine which had bothered the Island was lifted. During the year seven cases of the fever and one death from it occurred in Havana. The number of fever deaths in Havana alone used to go often above three hundred a year.

The Pope created four new cardinals last week, two of them Frenchmen—the Archbishop of Rheims and Marseilles—and a third to judge from his name, De Lai, is probably of the same nationality. That the Pope should increase the number of French bishops from five to eight seems to show that he wants to do what he can to help the French church, which henceforth must live on its own resources.

When the world is really old, scientists tell us, it will be as flat as Mars, for all the mountains will have been worn away. Civilization does with men what weather will do with the earth. It tends to eliminate the picturesque and Europeanize the world. Thibet, however, seemed immune from the tendency. But now the Chinese government has decided that a telegraph line shall go to Lhassa, the abode of the Grand Lama, and will institute a mail service.

We are accustomed to think that America and Great Britain are the only lands where the Jew may come to political honor, but the Holy City, Rome itself, has elected a Jew for its next syndic, or major. Signor Ernesto Nathan is the first syndic not a Roman by birth. He was born in England and has lived in Rome only twenty years. He is a Republican and a Free Mason and almost everything else that clericals and anti-Semites dislike, but not all those disadvantages prevented the Romans from electing him.

In the Druce case in London, where the heirs of a certain tradesman are attempting to obtain the property of the Duke of Portland on the ground that Druce and

the Duke was one and the same man, and that at Druce's funeral a roll of lead was buried instead of a human body, the English, after spending some months in arguing the question before the court, have decided to open the grave, and find out the truth. Give an Englishman long enough to think about a matter, and he will finally do the sensible thing.

A Danish inventor, Valdimir Poulson, who devised the wireless telephone, has notified the American Legation at London that he intends to establish a trans-Atlantic wireless telephone service. He nonchalantly puts the date that he will open the service in February. He claims that last week he was talking by wireless with Berlin from Copenhagen, a distance of 240 miles. The previous long-distance record had been made in Germany, where experimenters communicated at a distance of fifty or sixty miles. The vessels of our own fleet on its present cruise are all fitted with the new telephones.

One more modern miracle is gone by the board. The priest of Brin in France, as he was going through the mass not long ago, beheld the face of Jesus on the monstrance, the transparent box or pyx in which the consecrated wafer is exposed to view. The leading members of the congregation were called up to see the wonder, and all declared it a miracle. The diocesan authorities investigated the "miracle" more thoroughly, we may suppose, than their medieval predecessors investigated the miracles of their times, and found the whole thing was an optical illusion, caused by the reflection of a church image upon the wafer as the candles moved.

WOMAN'S SUFFRAGE IN ENGLAND.

In England the question of woman's suffrage is creating more than ordinary interest. Sir Henry Campbell-Bannerman has committed himself to the cause of the suffragists, and at a public meeting, in answer to the question what means the women had best take in order to win, he gave them advice very similar to that given them by his conservative predecessor, Arthur Balfour, who bade them agitate. Campbell-Bannerman put it thus: "You will have to do what all political missionaries have done, pester the people until they yield to you." The women are clever in their campaigning in more than the matter of breaking up Liberal meetings. In their open-air meetings, in villages where the right of franchise has never been agitated, they are likely, at first, to find themselves greeted on the common by an audience of a nurse and a squalling child. The suffragists thereupon scatter through the town, posing as ordinary women, and asking the villagers if they have heard the extraordinary sentiments being propounded on the common. Thus they obtain audiences and the next time they visit the village the common is filled. Unless the King makes favorable reference to their cause in his speech at the opening of Parliament in January they announce that there will be a "tremendous stir." Whether the majority of English women really want the suffrage probably nobody knows. But unless the suffragists get tired they will probably get it. The policy of nagging, although it provokes no love, and no admiration, is as effective as it was in the days of the unjust judge, who though he feared not God, nor regarded man, yet granted the request of the widow lest, by her continual coming, she would "weary" him.

WANT AND EXCHANGE

To accommodate some of our readers and bring them in closer touch with each other, we have opened this "want and exchange" column.

Rates, twenty-five cents per insertion, not exceeding four lines, including name and address. Five cents per line for additional lines. However, no "want" may exceed six lines altogether.

WANTED.—To correspond with Brethren who desire to know the best, safest, most economical and most convenient method of lighting their homes.—W. G. Nyce, St. Peters, Pa.

NEFF'S CORNER

You've heard of the doctor that wouldn't take his own medicine, haven't you? Well, it's a different kind of a doctor I want to tell you about now. It is well illustrated by the following incident: A gentleman in Utah wrote me, inquiring about opportunities for investment in Clovis. I replied and then received a second letter stating that he would like to have a house built and stating when and how he could pay for it. In accordance with his proposition I wrote out a contract and sent it to him for signature. Not one cent of money had been paid. I had never met the gentleman and only had his word for it as to who he was, but I made a payment on the lot, ordered the lumber and put men to work on the house, which is already inclosed. But someone says, How can you afford to do that? The Utah man may change his mind, decide not to sign the contract and never send you a cent of money. Yes, that's true. And of course I wouldn't think of doing such a thing if I were not one of the doctors that's perfectly willing to take his own medicine. What if the other fellow does decide not to take the property? I want several such properties myself anyhow as fast as I can afford them and build them, and hence I am taking no risk. It is generally conceded by people who have been here on the ground and studied the situation from the beginning that these rental properties will be very desirable and very profitable investments. If men of means and experience here on the ground did not believe in the town's future, then I wouldn't want it and wouldn't recommend it to you. As it is, I expect to be busy building houses for some time to come. One for a friend in Ohio will be the next thing in order and present correspondence indicates that I shall soon have to put another set of men to work to keep up. And yet everything indicates that the growth of the town has only made the merest of a beginning.

JAMES M. NEFF,
Clovis, New Mexico.

Just Published!

"RAYS OF THOUGHT"

By Josie Dayton Curtiss

This late work is the thought of mature years placed in poetry. The book contains about 50 poems on various subjects.

A few of the titles are:—

- "A Study from Nature."
- "Cause and Effect."
- "Grandfather's Place."
- "Our Ideal Home."
- "Storms of the Soul."
- "The Judgment."

"Rays of Thought" Appreciated

The first unexpected words of appreciation for "Rays of Thought" were voiced from the pulpit by Mrs. Curtiss' own pastor, Rev. Wesley M. Embree, soon after it appeared from the press of the Brethren Publishing House.

From a numerous collection of kind words from many people regarding the volume we select the following: Ex-Prof. Hyslop, Columbia University, New York, says: "A glance at the contents shows me I wish to read it all." Elbert Hubbard says: "Rays of Thought" shows a deep insight into things." Prof. Mangold, University, Pa., "Expresses a wish to hear more from the writer upon a specified topic." Luther Burbank, California, is especially kind and commendatory regarding thoughts on page 139.—Republican News, Maringo, Ill.

The book is well bound in cloth and gold stamped. Size 5¼x7¾ inches.

Price prepaid,\$1.00

A copy of the "Ideal Nurse," a 16 page folder with cover, free with each book.

LOMITA, CALIFORNIA

1. Situated four miles from the ocean, and near San Pedro Harbor. Rich soil, excellent natural drainage. Can grow crops 12 months in the year.

2. Three wells of soft water for irrigation and domestic purposes. Water piped to each one's land. Settlers to own all water systems.

3. Natural gas comes up with water, and is used in engine to pump the water, making the expense of lifting quite nominal. Gas leaves the water on reaching the air, hence pure water.

4. Markets at the front door and back door; land and water transportation to all the world.

5. Grain and corn raised without irrigation. Crops from October to May, barley, oats, wheat, onions, cabbage, beets, peas, cauliflower, radishes, citrus and deciduous fruits, nuts, and vegetables in their seasons. Government analysis of soils shows much of this land very fine for oranges and lemons.

6. Six lots donated for German Baptist Brethren church. Good opening for business. No saloons, no pool rooms can be operated on these lands.

7. All kinds of produce bring good prices, at San Pedro Harbor and Los Angeles. Profits from \$100. to \$500 per acre per year. Settlers arriving right along. This colony sure of success, as it has the soil, the water, markets, the push and a twelve months' climate to grow useful things.

Olive Branch of Peace

Valuable Contribution.

Dear Brother, Hays: I have ordered a copy of your book, "The Olive Branch," and have read it with exceeding interest. It is a valuable piece of contribution, not only to the history of the Valley of Virginia, but also to the history of the Brethren Church and other peace loving societies of God's people. Especially is it valuable as a clear and full statement to the world of what the world is coming more and more to recognize as just, reasonable, and desirable—Peace, and the spirit of Christian peace. I pray and believe that by means of this book, "The fruit of righteousness is sown in peace of them that make peace."

Yours fraternally,

John W. Wayland.

University of Virginia, Charlottesville, Va., Oct. 29, 1907.

This book contains 232 pages, has a number of illustrations and is well bound in cloth.

Price prepaid,75 cents

AGENTS WANTED.

ALBERTA

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the Brethren already there and enjoy some of the material benefits as well as help build up one of the largest Brethren Colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

CATARRH

And Head Colds

Successfully Treated With the New

OX-O-NA-TER

The Only Natural Way

which will be sent to readers of The Inglenook on 10 day's approval.

It is folly to treat Catarrh of the Head by taking drugs into the stomach. Ninety per cent of the people are afflicted with some form of Catarrh. They are living storehouses, or distributing stations disseminating germ life, that breeds diseases from incipient Catarrh to quick consumption. Air is the agency through which these germs find lodgment in the air passages. Air should be the agency through which they are destroyed and removed.

IF YOU HAVE CATARRH, LET ME SEND YOU MY NEW OXONATER ON 10 DAYS' TRIAL FREE.

Then if you are fully satisfied with the benefit received from it—if you would not be without it for many times its low price, you can send me my special introductory price of Two Dollars. Otherwise return it, (postage 5 cents, which I will gladly refund).

Catarrh begins in the nose, but progresses rapidly to the throat, then the larynx, stomach, kidneys, leading to the dread tuberculosis. CHECK IT NOW. My Oxonater works on entirely new principles, delivering absolutely dry healing vapor directly to the inflamed surfaces. It is curing thousands of the worst cases. It costs nothing to find out if it will cure you. Valuable Catarrh Book free.

A SQUARE DEAL GUARANTEED

Just send your name and address, naming the Inglenook.

I want you to try my OX-O-NA-TER 10 days, free, at my expense. You cannot afford to miss this opportunity. Don't think of missing it.

Address today, E. J. Worst, 216 Main St., Ashland, Ohio

MAILED ON TRIAL FREE

We want you to try Pure Herb Tablets

TEN DAYS FREE

and prepare your system for the changeable weather of your climate.

Pure Herb Tablets

Quickly relieve Constipation, Stomach and Kidney Trouble and Rheumatism.

No Alcohol, no Opiates, no Narcotics.

3 MONTHS' TREATMENT \$1.00.

If you have a stubborn case of Constipation, Rheumatism, Kidney or Stomach Trouble, or if you feel bad in any way, try Pure Herb Tablets. They are a wonderful treatment for the digestive system. They strike at the root and cause of the disease.

In most people Uric Acid is present in the blood, gradually accumulating as they grow older, and by lodging in various organs of the body, it causes disease. The blood grows old and impure, thus undermining the strongest constitution.

SEE HOW EASY.

Just send us a mere postal card, mentioning the Inglenook and we will mail three months' treatment of our Pure Herb Tablet treatment. Use them ten days, if perfectly satisfactory send us \$1.00, if not, simply return the balance and you still have your money. We claim this treatment has no equal for above diseases, and take this honorable way to prove it to our patrons. Don't hesitate.

Speed the day by sending now to

Do well in

BUTTE VALLEY CALIFORNIA

and

ROGUE RIVER VALLEY OREGON

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

ARE YOU GOING TO

California Washington, Oregon Idaho

Or Any Other Point?

Take the

Union Pacific Railroad

Daily Tourist Car Line

BETWEEN

Chicago, Missouri River, Colorado,
Idaho, Oregon, Washington and
California Points.

TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

Be sure to buy your ticket over

The Union Pacific Railroad

known as the Overland Route, and is the only direct line from Chicago and the Missouri River to all principal points West. Business men and others can save many hours via this line.

LOW RATES

BUTTE VALLEY

ANY people have been writing the different agencies asking when they can get colonist's rates to Butte Valley. We now have the information to give. During March and April there will be a one way colonist's rate from Chicago of \$38.00, and from the Missouri River, \$30.00. Rates from other points will be given upon application.

¶ The first Special Excursion given for those who are moving to the Valley in the Spring, will leave Chicago, Tuesday Evening, March 3, at 10:45 P. M., via Chicago and Northwestern and Union Pacific. Train leaves Northwestern Station, corner of Wells Street and 5th Ave.

¶ We kindly ask those who are going to notify us early so we can make ample arrangements for their accommodation. Heretofore, a great deal of inconvenience has been suffered because of neglect to notify us.

¶ Several States will be represented in the next excursion. Many people are moving who have already bought, a great number are going to buy, and still another class are going as delegates representing a number of families to investigate and report. It seems almost incredible that only eighteen months ago there was a wide expanse of sage brush where now there is to be found a thriving business community getting larger every day.

¶ The most commendable feature of Butte Valley is that the people who live there are the ones who speak most highly of its climate, soil, water, health, and who have been able to honestly say anything detrimental of the Valley. The first crop was a good one, their first winter a mild one, and, as H. F. Maust says, their fondest hopes have been more than realized in every way, except that the railroad did not get there as soon as expected on account of unavoidable delays.

¶ Once more we say, do not forget to write at once.

Possibilities of IDAHO

Unlimited

Many Brethren are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for Brethren and others of small means to get good comfortable homes with a splendid income.

Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

Realize \$1,000.00 Per Acre

Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

HOMESEEKERS' ROUND TRIP TICKETS

Will be in effect in the Spring of 1908

Colonists' one-way rates in effect from March 1, to April 30, 1908

Religious Work in the Army

Rev. Robert Day

Ex-Chaplain of the United States Army.

Some Account of the Christian Labors of the U. S. Soldiers' Christian Aid Association, of New York.

THE United States Soldiers' Christian Aid Association is one of the oldest organizations in the United States. The plan of the Association is to aid the garrisons by sending supplies of moral and Christian reading matter; by aiding in procuring libraries of good and entertaining books, and by coöperating with chaplains in holding song services and religious meetings; furnishing organs, gospel hymns, music and supplies, and such modern helps as stereopticons and views, magic lanterns and slides, graphophones and records, for barracks and hospitals, to furnish evening entertainment for the soldiers and save the young enlisted men from the low haunts of vice and crime that spring up just outside of all military reservations. The Association also labors in a variety of other ways for the best moral interests of the troops.

Matthew Henry remarked in his day, that military men were not greatly disposed toward religion, and yet in the Puritan era there had been soldiers who had left their mark upon their age—men who would never have achieved what they did apart from Christianity. The power of the Gospel is as great as ever; and it is as great a gain as ever to be served by God-fearing soldiers. Who shall measure the good which has come of the operations of the United States Soldiers' Christian Aid Association during the past forty-six years? If in olden times the soldier seemed to have all things against him, he has now all things in his favor; and it is a good sign of the times that fewer soldiers than formerly are subjected to the discipline of our military prisons. One can well believe that this is in large measure owing to the influence of chaplains. These chaplains are valued by the men in general; for, not only are they good teachers and advisers, but they are continually doing little services for the men—such as writing letters to friends at home, etc.—which the men

themselves know best how to value. Then it is something for friends at home who value religion to know that the regiment has its Christian adviser. "It is a sad necessity that we should have soldiers," said an army chaplain; "but as we must have them let us be thankful that we have so many godly, righteous and sober men wearing the uniform."

Fathers and mothers will be glad to know that a young man may find good friends in his regiment, who will seek him out and teach him the good and right way. This alone is an immense benefit, and is quite becoming in a professedly Christian nation. Those in command cordially recognize the good that is being done, especially if they are themselves Christian men. In reference to this, a veteran officer once remarked:

"No one can more fully appreciate the trials and temptations of soldiers than those who have themselves felt them; have gained a glorious victory over them, and felt a conscientious call to devote themselves to save others by their warning voice and counsel, and by the example of a better life. No one can tell so well when the voice of a friend will be listened to; no one else can have such opportunities of seeing the moment when the path of the young soldier may be turned from evil to good."

We find that in the Philippines Chaplains Dickson, Nave, Pierce and Rice, and many others, acted faithfully in the midst of the war by helping the wounded to the rear, and in other ways sustaining the character of "good soldiers of Jesus Christ." They rendered signal service where special aid was urgently needed. Thus, if we ask Major Ketchum, the Corresponding Secretary of the Association, what the Society, with which he has been so long identified, has done, his answer is: "It has faithfully, zealously, and successfully endeavored to spread the saving knowledge of Christ among the soldiers of the American army." The success which has already attended the efforts of the Association and the chaplains in bringing the Gos-

pel under the notice of the troops is the best encouragement to attempt greater things in the future; and what has been done also shows how well adapted the means used have been to accomplish what has been had in view. In all respects the chaplain is the best possible agent for more widely diffusing throughout the regiments those gospel tracts, leaflets and Christian publications which soldiers will read in their leisure hours. A great deal is done in this way; and then, in addition, there is the monthly issue of the *United States Soldier*, and *Christian Sentinel*; which, being full of good teaching, is ever cordially welcomed in the barracks, camps and hospitals. When he becomes amenable to this Christian teaching, the soldier is raised in the social scale, and is thus no longer a mere instrument of destruction to his enemies, and a reproach to his friends;

A good deal for which any Christian heart may well be thankful has been done; but through showing healthy life, the Association naturally wants to extend its empire. The military field being so vast and fruitful, the secretary and his associates naturally desire to sow more on the one hand and to reap a greater harvest on the other. The desire is to have a chaplain in every garrison and in every camp where soldiers constitute a congregation. To carry out this design the present staff of chaplains will need to be largely increased. For such a nation as this the carrying out of such a work would be a small affair, the cost being comparatively trifling. At the same time the Association will never do all it desires until the public shows greater interest in the work and increased solicitude for the soldier's moral and religious welfare; and until sober-minded men rise up to the duties of the occasion.

This service is carried on among the men of the regular army; and if you were to look in on a chaplain in his barrack-room—which he regards as being peculiarly his own—you would find the man with all things at hand which he thinks a soldier might require. Periodicals to read, pens, ink and paper, needles and cotton, buttons and other things, including a pledge-book, besides a book to take account of money given into his charge for safe-keeping. An officer testifies:

"Unknown to the chaplain, I have gone into his library-barrack several times, and a more comfortable room could not be wished for; well furnished, well supplied with all kinds of literature of the most wholesome description. Printed notices are placed up, that no swearing or gambling is to be indulged in, and the men speak in low tones and seem to respect the presence of the chaplain amongst them, who is, indeed, a cheerful soldier's friend. Once a week he provides a concert for them; a Bible Class, and a temperance meeting. He has a post-box on his table, where the men post their letters and he clears the box at intervals, supplies them with stamps, and has procured for their use a stamp of the regiment to put on their letters. He uses great tact in his conversation, and it is a pleasing sight to see the chaplain sitting among the men who gather

around him and listen to useful information on all subjects."

In such a room hundreds of letters will be written, weekly; while the general result of the soldiers frequenting the room is seen in a lessened attendance at the grog-shops, as well as a falling-off in those particular offenses to which the military seem to be more particularly addicted. By way of what is being done in individual cases, I might cite this example of a young soldier. The regimental chaplain says:

"I first made his acquaintance in the hospital in the early part of June; he seemed very glad to enter into conversation about eternal things, telling me that he had a godly father and mother, and was brought up to love and fear God; but when he left home and joined the army he went to the bad, and forgot all his early pious training. He said he had latterly been troubled in soul and had had for some time a desire to lead a better life. The early Sabbath-school training came back to him, and he was convinced that he was not living as he ought to do. The one thing that seemed to be barring this young man was the fear of his comrades; although he wanted to be a Christian. This is the case with many. He drank in with all earnestness the Word of Life as it was read to him, and soon the light dawned into his soul; and on entering one day I saw a very great change had taken place; his face was pale and white, but there seemed to be a glorious, peaceful smile upon his countenance. In asking him how it was with him, his eyes brightened up as he exclaimed, 'It is all peace; it is all peace'; and in conversing with him I saw that he had truly found Jesus, and it was a pleasure from that day forth to meet him."

If we look around at military posts or garrisons, to which attention is called, we shall find that the work presents the most encouraging outlook. One chaplain remarks: "I am well received, everywhere, and my visits to the men in the barrack-rooms inspire the hope that good is being quietly done. Temperance reform is making progress, and has already served to check many who were pursuing a downward course."

The chaplains have all done good service in widely diffusing pure literature, and in prompting temperance; and speak of some enlisted men having lately joined the church—men who by their consistent lives show the reality of the change which has come over them. Among the cases of individual reformation, a sergeant in a letter to one of the chaplains, writes:

"I was a hardened sinner; my leading vices were drink, swearing and Sabbath-breaking. My reasons for going to the Bible Class were as follows: Knowing that the meeting of the Temperance Society was held a little before the Bible Class on the same evening, I went and became a total abstainer. But I found I had not strength of myself to keep the pledge, and my sins were always confronting me, and I felt peculiarly uneasy. So I offered a short prayer, and resolved, with God's help, to attend the Bible Class; I did so, and that was the first happy hour I spent, as cloud after cloud was dispelled by the rays of light from the Son of Righteousness. I am sure I am better liked by the men of my company, for I am not likely to get into a bad temper and swear at them as I used formerly."

Happily, there are in the army many officers who are professed Christians—the case being thus widely different from what it was in former times—and such officers show great interest in the welfare of their men. We have in mind an officer, none of whose men were absentees from public worship, and as many as two hundred of the regiment would attend the Lord's Supper at one time. Some officers are quite as devoted in the present day, and we only respond to their desire when we do what we can on behalf of the United States Soldiers Christian Aid Association; whose work, although quite unknown, seems to me to be of the greatest importance, at this time, and should command the support of every Christian patriot.

NOTE.—Persons desiring to aid in the foregoing work among our soldiers will please address Major John B. Ketchum, 23 Park Row, New York, N. Y.

PROHIBITION IN THE SOUTH.

N. R. BAKER.

THE South is going dry. A perfect paradox, a pure anomaly! The South, the home of the tipling colonel, the foster father of the moonshine still, the paradise of the brewer and the corner grocery with "licker" in the rear end, is fast becoming prohibition territory. Two whole states, 500 counties, towns and precincts without number, have voted out the saloons.

The people are in earnest. The women are awakened. The children are speaking in temperance contests.

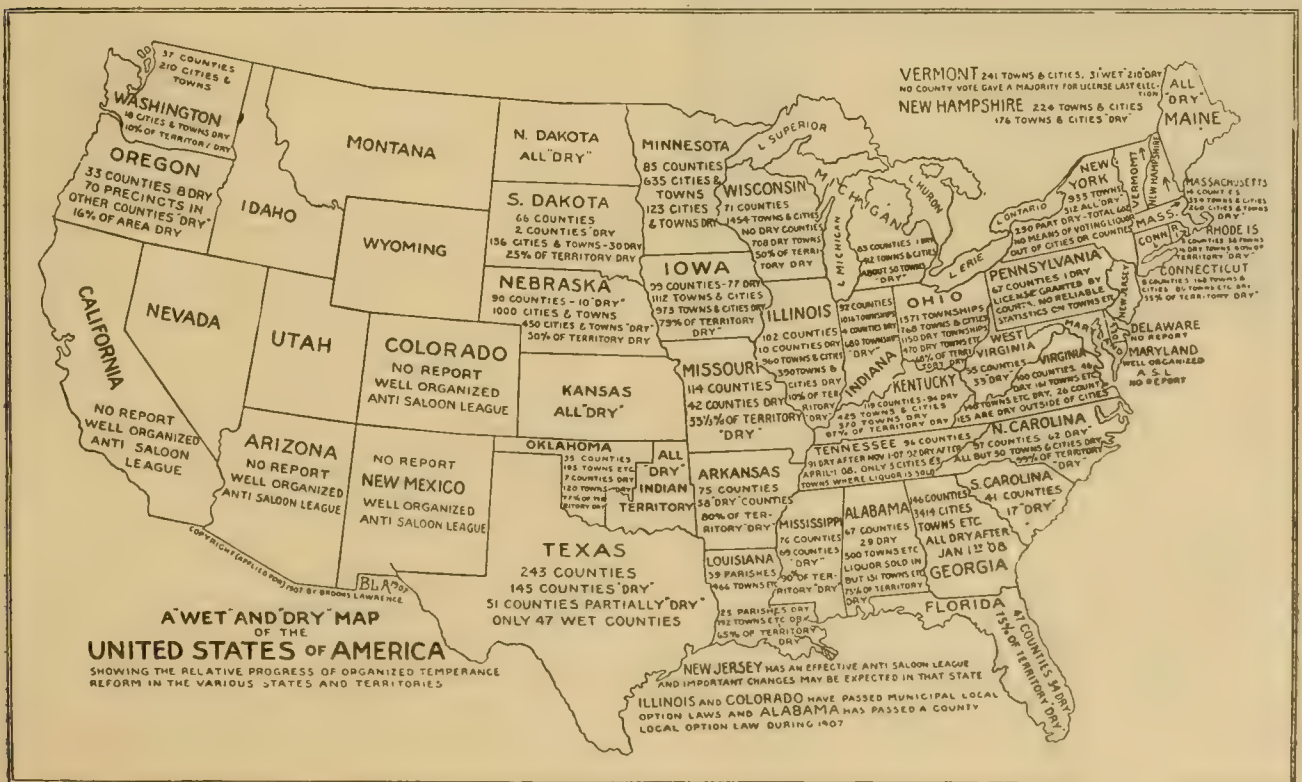

The South is conservative and the voice of women

is seldom heard in public. But in the prohibition cause she is given full rein. Modestly but firmly she speaks in churches, halls, schoolhouses, or on outdoor platforms. On election day great numbers of children are massed around polling places singing temperance songs. At Montgomery recently, the crowd of women overflowed the capitol building and while the members of the legislature were filing into their seats these thousand ladies sang "Alabama's Going Dry."

There is the usual bitterness of a local reform campaign, each side puts forth its best arguments and its strongest means of influencing voters, but the result is always the same—prohibition. Many a hardened drinker votes for it to remove the temptation from him. Men with children, though tipplers themselves, wish to remove the sight and smell of alcoholic beverages from their children.

I met four men on one block. One voted for prohibition because his brother was harmed in a drunken brawl. Another just out of the barroom, with liquor on his breath, would vote for it because his "folks" wanted him to do so. Another, because without high license the whiskey would be cheaper, and the last because he was "tired of the whiskey trust running things." But all vote for it.

Some members of the legislature of Alabama voted for statutory prohibition because it would go into effect one year later than the local option which would be sure to pass if a local election were allowed. Thus their counties would be "wet" one year longer and hence, though favoring intoxicants, they voted for the State Prohibition Bill. Others because they bowed to

public sentiment—and expected to run for probate judge or county clerk.

But, whatever the reason, the vote was for prohibition. Out of 34 members of the Alabama Senate only two dared vote against prohibition, so deep and wide is the temperance wave.

Mobile, Ala.

WINTER STRAWBERRIES IN GRAND VALLEY, COLORADO.

S. Z. SHARP.

ON Nov. 26, the day before Thanksgiving, we went to the berry patch of Mr. L. D. Lee, one of the many

fruit growers around Fruita. We picked several messes of strawberries and while picking them we thought some of the readers of the "Inglebrook" might wish to know how to raise strawberries in winter. As short a way as any to tell how, would be to relate how Mr. Lee did it.

The early strawberry season in this valley begins about the 20th of May and lasts about six weeks. This year the late frost which prevailed over the greater part of the United States, cut short the early strawberry crop in this valley also, so that not many were shipped before the first week in June.

On the third day of July he stopped irrigating the plants and let them wither to the ground and then

mowed them off and cleared the patch for the winter crop. He irrigated freely, and the constant supply of moisture and warm sunshine made the plants shoot upward and bring forth leaves, blossoms, and berries in quick succession. The first week in September he sold the first crate of ripe berries from the second crop of the season which lasted to November 11th, when he shipped the last crate—the second season lasting about ten weeks.

The quality of the berries in the fall and winter are in every respect equal to those of spring and summer, though they do not attain to that rich dark red color of those which ripen when the sun is hot. The size is remarkably large and scarcely any defective berries are to be found. One lady at the packing table on another ranch laid aside the large ones as she was packing and found that only thirteen could be put into a quart measure.

The market in the fall is better than in the spring. We sold some in Denver at \$5.25 per crate.

The above cut is a fair specimen of a bush with its leaves cut away.

CITY SANITATION.

Probably, few of the people in the North are aware of a colossal case of municipal housecleaning that is taking place in New Orleans, the Pride of the South; yet one of the greatest engineering undertakings in the world is being successfully carried forward there, which will render it the peer of any American city, from the hygienic standpoint. A sewerage system that will cost twenty-five millions of dollars is being installed, and two hundred miles of it are already in working order. When it is borne in mind that the city is built on sunken ground, half of it encircled by a great river, the waters of which are from six to twenty feet above the city's level, the said waters being only held back by miles of dikes and levees, the magnitude of the work may be approximately estimated. The difficulty of securing drainage was the problem that confronted the engineers, the only solution of which was the installation of a pumping system of mammoth proportions. The entire amount of city sewerage must be lifted from the city level to that of the river; but herculean as the task appeared, it is being successfully worked out. Already seven pumping stations have been completed and are in operation, discharging the sewerage into the river below the city. The drinking water supply is taken from the river above the city, and as the current is rapid, there is no danger of contamination. Those who knew the Pride of the South, even five years ago, would be surprised at the change that is being effected. It used to be said of New Orleans, that every block was characterized by its particular individual smell; that would enable a blind-folded resident to determine his location at any time; but that reproach will soon be a thing of the past. But the sanitary awakening has not been limited to the sewerage question. The city has an admirable milk inspection system, and a health department that would do credit to any community. All honor to our southern sister! May her brilliant example be followed by every city in the Union.—Health.

I HAVE lived to know that the secret of happiness is never to allow your energies to stagnate.—
Adam Clarke.

TWENTY things half done do not make one thing well done.

The Mettle of a Governor

O. H. Kimmel

THE honorable person of whom we are about to speak was born in direst poverty, on an Ohio farm, forty-seven years ago. At the age of five his father died and he went to the home of a farmer pedagogue by the name of Miller to live. Miller as a teacher was an exception to the general rule in that peculiar

profession. He had an ambition to collect a substantial portion of this world's goods, and was eminently successful. His care for the schoolroom lay mainly in the compensation received at the end of each month; consequently the young boy admitted to his roof was not permitted to attend school much, but was compelled to labor at home through the long winter days.

Gov. Haskell of Oklahoma.

The selfishness of this man, as is often true in such cases, was not shared by the good Mrs. Miller, and the maternal love that had been bestowed upon their own son, who had died before the orphan boy had come to their home, was transferred to this lad; she sympathized with him and cared for him in such a manner as to make the home a comfortable place for the boy so far as it was within her power. Mr. Miller did not confine his selfishness to money getting, but he held himself aloof from the family, so the congeniality of the home was between Mrs. Miller and the boy, and the long winter evenings were usually spent in reading and study.

So persistent were they in this work, and they pursued it with such care and thoroughness that, by the time the lad had reached his sixteenth year, he resolved to go to the county seat and take the examination for a teacher's license. He told Mrs. Miller of his determination and she encouraged him, but advised him not to tell Mr. Miller, who she felt would strenuously oppose the procedure.

One morning the boy rose early and with fifty-five cents in his pocket started on foot to the county seat, twelve miles away, to take the examination. The fifty cents admitted him to the examination where he wrote until noon, and then spent the five cents for a sandwich. After dinner he finished the examination

and returned to his home. He arrived late at night and quietly entered the house and retired. But the crafty Miller discovered the secret, and the next morning, with a great blacksnake whip in his hand, called the boy into the feeding room of his barn and demanded an explanation of him for running away to the county seat to take the teacher's examination, announcing that, after the explanation was made, he would chastise the lad in such a manner as to cause him to remember for all time to come that such insubordination should never be shown again. And, in this threat he made the fatal mistake that so many fathers, teachers and other people make. He caused the new but latent force of manhood in the boy to become suddenly aroused and he at once developed the character that is his to this day. He seized a pitchfork and made for Miller. Miller, like all such bluffers and cowards, ran to the house for his wife's protection, and the affair ended there because of the power of this woman over the boy.

But Miller was resourceful, and he pursued other tactics—tactics which he was quite certain would end in his favor. He rode to town and asked the examining commissioners not to permit the boy to pass, for he needed him so very badly at his home. This admonition on the part of Miller caused the commissioners to look solemn but thoughtful, but a firm resolve took root there. They resolved to grant the boy license if it were possible to do so. This was found to be easily possible, and they took precautions in delivering the license certificate to the boy.

He applied for a school not far from his home. Here Miller again interfered and advised the board not to employ him. This caused the board to desire especially to employ this lad, and they did, and he taught school successfully for several years. His habit of evening study served him well now, for he spent the long winter evenings in reading law and he was finally admitted to the Ohio bar, and entered upon the practice of his chosen profession at Putnam, Ohio. Some years later he was elected to the state legislature and served with power which won him a state-wide reputation. Later he was nominated by his party for governor of his native state but was defeated.

Soon after this he moved to the new Oklahoma Territory and began to practice his profession in Muskogee. He identified himself with other work also, such as contracting and building, and in connection with this became active in the politics of the Territory of his adoption. When the fight for statehood began to take the definite shape and form of

life he became one of its strongest supporters, and when the constitution for the new State was drafted he was one of its staunch and strong advocates. When the time came for his party to nominate a candidate for the first governor of Oklahoma, they turned their eyes to the subject of our sketch and Charles N. Haskell was nominated. After the preliminary skirmishes of a political campaign ended, and the election was held, the people of this new empire of the Southwest decided in no uncertain voice that Charles N. Haskell was their choice. And they have in him a man self-made and strongly schooled in the real battle of life; a man who has known poverty from contact; one who has struggled from the lowest place; one who has shown in his strong personality the ability to meet successfully the battles that a life must meet; a man of unswerving integrity; a man of the people; a man from among the people, and a man whom the people have a right to trust. And though Oklahoma is already a great state, it is fitting and proper that it starts its life in the National Union with Charles Haskell at the helm, a man who is able to keep one hand on the throttle and the other on the safety valve of the commonwealth's general welfare.

HOW WE THINK.

II. M. FOGELSONGER.

7—Multiple Personality.

THE purpose of this paper is to acquaint the INGLENOOK readers with some interesting phenomena of the mind as well as clear up several superstitious beliefs. By multiple personality we mean an individual who has two or more parts to his mental life. When the division is nearly or wholly complete, the case is abnormal but the habits of nearly every person are divided into sets or groups.

We will begin with the normal and afterward the abnormal will be better understood. The most obvious cases are found in cities where men make their living by working in shops, offices or stores. If a man works in a shop his life will be divided into two parts, home and factory. For ten hours during the day his mind is busy at some special kind of work and very likely the work is the same day after day. If he is a blacksmith he will think about different kinds of iron and steel welding, bending and fitting. Now such things have little relation to home life. When at home the blacksmith eats his meals, does small duties about the house, reads and talks with his family. In the shop the conversation is about blacksmithing in general and subjects of a more or less coarse nature. At home he talks about happenings in the neighborhood, in the town, about church matters and home affairs. You see how the life of such a man is divided. In ordinary language, he does not act the same in the shop and home. Of course his habits are different in the two

places, they cannot be otherwise. He has two lives to live every day, one at home and one in the shop. However these two lives are not entirely separated. At home the blacksmith naturally talks about his wages and the incidents of the day. In the shop the conversation with his fellows is often about his home and savings account. The two persons Mr. Blacksmith and Mr. Blacksmith-at-home are so connected that one man can easily be both and lead a normal life.

Something similar to the above happens in the life of every person. What we call self is a group of systems of experiences more or less closely connected. What I call myself is not a definite and fixed something. Its limits are not clearly defined and it changes from day to day. We act according to our surroundings which as every one knows are not always the same. The self is a combination of all these minor selves or systems. We have separate ways of acting and thinking at home, in the homes of friends, in the presence of strangers, at church, in business transactions, when traveling and when taking vacations. Each one of these ways of acting forms a system, and our whole life is composed of these clusters of experience. In church it is natural for the average person to sing, pray, listen to the minister and think about religious things. In the home it is natural for the wife to think about her work, her husband, and the training of her children. But we must remember that all these systems or selves have common parts so that they are not entirely distinct from each other.

Thus far we have not touched upon the subconscious states. These play a very important part in the make-up of the self but for the sake of simplicity we will pass the subject by with mere mention. The study of the subconscious leads into a labyrinth of difficulties that is best to keep out of unless you have had more than a general idea of psychology.

We now turn to the abnormal. Numerous cases have been found where the mental life of persons has been cleaved into two or more parts. When living one life the individual could not remember anything that happened while living the other life. Dr. Morton Prince has written some interesting things in a recent volume on the Disassociation of Personality. There are other writers too, both in English and in French, but Prof. James gives an illustration which I will relate because it shows clearly what I am trying to explain. A Rev. Ansel Bourne, of Rhode Island, was a traveling preacher and had a firm disposition and an upright character. Other than being subject to headaches and temporary fits of depression, he was a healthy man. One day he drew several hundred dollars from the bank to pay for some land, but after boarding a car his memory failed. He did not return home that day and the police were unable to determine his whereabouts. Shortly afterward this same man, Rev. Bourne, started up a small candy store in Norristown,

Pa., under the name of A. J. Brown and nothing appeared to be the matter with him mentally for he attended regularly to his business. But one morning, after six weeks of this life had passed, he woke up in a fright and wanted to know of his neighbors where he was. The old self had returned and he was again Rev. Bourne. As Rev. Bourne his memory was a blank from the time he started out to pay for the land. The sincerity of the man was not doubted at all.

Other cases have occurred where the several personalities have changed from one to the other. One personality would last for several days or weeks when another would come upon the stage, after which the old one would return. They may thus alternate from one to another. There is a distinct lapse of memory from one personality to another.

The cause of this multiple personality is, on the nervous side, a breaking down of some sort. The brain, like other parts of the body, will give way under insufficient nourishment, or under strain. There is a breaking apart of connections or associations and this cleavage may be caused by a shock or some disease. To make this clearer, I will give an illustration which is very crude and cannot be applied in its entirety. Suppose there are several local telephone exchanges in a county and all these exchanges are united so that a subscriber of one can talk to any person in any of the other systems. It is one large system made up of several smaller systems. Now again suppose that an accident happens to the toll lines so that all the exchanges are disconnected from each other. Persons in one exchange are not able to talk over the lines of the other exchanges. Now think of such a thing happening to the mind of a man, leaving one system or personality on the stage of activity while the other ones are in the background. Dominating ideas tend to form partially marked out division lines in the field of association and when a disturbance comes these separations are completed. I do not mean to say there is an entirely different being with each alternation of personality. There is the same body, the same limbs, the same vital organs, the same brain, but there is a different dominating idea ruling the mind. This new central idea may change the habits, desires and daily life of the individual for it often happens the disposition of the individual is almost entirely changed about. Instead of being cheerful the new person will be quiet and depressed, or instead of being timid the person will be reckless or vulgar. As was said before, these abnormal cases can usually be traced back to some shock or mental depression. A man may have some secret thoughts of which no one knows but himself until they are manifested in actions; and these secret broodings are nearly always centered about some ruling idea.

There can be nothing more supernatural about cases of multiple personality than there is about any per-

son. The stomach, heart and lungs are liable to disease and so is the brain. A man or woman who is abnormal mentally is not bewitched, as many people say, and such an unfortunate person is to be pitied and helped instead of carelessly spoken of as is often the case.

This paper closes a brief sketch of the many phases of our mental life. No one can study the mind or brain without becoming deeply impressed with the wonderfulness, complexity and beauty of its structure. Then when we review the noble works that are the product of man, of the great part which our ethical nature plays in life, we are drawn nearer the Source of all goodness. Man and the whole universe have reflected much of this God but the end is not yet. More beautiful and holy things are in store for the world in ages to come.

CURRENT COMMENTS

FOOD NOTES.—No. 3.

We pass by the subject of food adulteration and inquire into the sanitary conditions of your cellar. Is the air in your cellar fresh and invigorating when you inhale it, or is it stuffy and musty? All the eatables which have been in the cellar for a long time will be saturated with the gases and poisons contained in the air in the cellar, so that apples, meats, vegetables, liquids, butter, cake, etc., are often unfit to eat after lying in an atmosphere where decayed vegetation, damp, mouldy walls, unventilated rooms and other dirt and dust has not been cleaned away and the room fumigated, whitewashed or thoroly cleaned by some means.

Do you get a whiff of foul air as you open your cellar door? Well, that poisonous air creeps thru the floors and cracks into your living and sleeping rooms above day and night. It is no wonder that people feel languid and heavy after breathing such air all night. Something like one-third of our body's nourishment is obtained from the air we breathe, and after being robbed of fresh air for an entire night it is enough to make the body weak and stupid.

If people would give as much attention to having a sanitary cellar as they do to furnish their parlors, then their general health would be better. Cesspools, drinking water, ventilation, light, etc., all need attention in every home in order to get the most physical enjoyment out of life.

LAST YEAR'S CHARACTER.

The Hague Conference perhaps echoes the most general trend and sentiment of the year. International alliances went to strengthen peace all over the world. There are no wars except a little outbreak in Morocco, while the Central American States, which have been warring with each other for many years past, entered into a peaceable compact and set up a tribunal before which each nation is bound to settle differences with their neighboring nations. Evidently peace made gains last

year—even Japan showing a disposition to enhance peace.

The New Congress in both Germany and England stands for social reform. France and Italy readjusted matters pertaining to church and state.

There were no great natural calamities such as earthquakes and storms. The business world made great advances, but suffered a small panic in the closing months of the year.

India developed an unrest and an individualizing such as she never showed before. Education is arousing the natives of that country to be an independent state. Persia was the playground for civil wars. In brief, the trend of events in 1907 mark a social reform and readjustment on a world-wide scale.

Religion and education has had half a century of leavening in the ruling centers of the world, and is about to prove the power of the Cross to fraternize the human family and bring forth a world of society in which good will, equity and justice to every being is the standard of living. The ruling events of last year showed signs of progress in this direction.

WHY EDWARD PUBLISHED HIS MOTHER'S LETTERS.

Nothing could be more emphatic than the language put into the mouth of King Edward by those, including Viscount Esher, who have undertaken to say why his Majesty ordered the publication of the late Queen Victoria's letters. The King's real object is to proclaim the fact that he is no mere figurehead any more than was his mother. Edward VII claims to be a constitutional king in the strictest sense of the word. His mother was a constitutional queen. He and she claim supremacy over the army. To elucidate this point of view, Viscount Esher was commanded to run through the letters left by Victoria. They had been bound into stout volumes to the number of hundreds. The mere labor of copying these portions of the correspondence that proved available for publication took the time of thirty young women typewriters for weeks. King Edward clung tenaciously to his purpose that only such portion of this mass of matter as would serve the end he had in view be given publicity. There stood revealed last month, in consequence, what the preface to this correspondence significantly calls "the unrealized checks and balances," and "the delicate equipoise of the component parts of our executive machinery." The sensation of these letters resides in this revelation. King Edward, since he has inherited his mother's throne, has inherited his mother's power. He is, too, evidently wielding it in his mother's spirit. And Victoria was no figurehead, whatever her people and the outside world may have been allowed to take for granted.

EVADING THE RUSSIAN CENSORSHIP.

Bookselling in Russia would seem to be an occupation not eminently attractive to the seeker after fortune, tho fortune might come to him who is willing to take the risks. For the past two years Russians all over the Empire have been feeding their starved minds, but the period during which this could be carried out without molestation was very short. From the time of the Czar's manifesto in October, 1905, till the date of the dissolution of the first Duma a real freedom of the press was enjoyed. Since the latter date that freedom has given place to a censorship almost as tyrannous as before. Mr. Leroy Scott, who recently visited Russia, gives in the "Out-

look" the following account of a personal experience in a St. Petersburg bookshop:

"I asked for several forbidden publications, and was informed with great courtesy that they did not have them. 'They had them, but they were afraid of you,' said a Russian friend after we had gone out. At another bookstore, to whose head I had an introduction from Gorky, the situation was just the opposite. Whatever forbidden print I asked for was shown me instantly, though with extreme caution, for any of the students and professional-looking men who crowded the store might be a spy. At length I asked for a little pamphlet telling the story of Zimaida Konoplannikova, the girl terrorist who, a year ago, killed General Minn, a most dangerous book to have about. The dealer fumbled under the counter, let me in behind the counter beside him, and handed me a large volume of government statistics. 'Face the crowd, it's in that,' he whispered. I faced about and opened the book, with its back toward the other customers. There, within its pages, in a red cover, was the story of the ex-schoolmistress, who had boldly and gladly exchanged her life for the life of one hated as a brutal tyrant. Behind the protection of the government report, I slipped the pamphlet inside my coat. Then I handed back the big volume, and the publisher looked relieved."

THE EFFECTS OF ODORS.

Heretofore little attention has been given to the physiological effects of odors, but lately a German physician has confirmed a popular belief that strong perfumes have an intoxicating and benumbing action. His experiments were made by placing frogs under glass bells with sponges saturated with fruit essences. As in chloroform poisoning a brief excitement is followed by partial or complete paralysis, the many extracts tried seemed to differ only in rapidity of action. Musk was one of the slowest. Camphor, peppermint, lavender and cloves were slow, while aldehyde, turpentine, elder flower, ylang-ylang, asafetida, mustard and nicotine, were rapid and energetic. Instantaneous action was noted in some cases. Jumping about for a moment or two in a lively way, the frog would very soon stop, close his eyes and rub his nose. His breathing and heart action soon became slow, and he freely perspired. Continued a little longer, the odor caused convulsive breathing, rolling of the eyes, and gradual stoppage of the heart.

THE EVILS OF GOVERNMENT BY NEWSPAPERS.

Newspapers are generally regarded as great educators, a blessing to the world. As purveyors of news they are a necessity. They place before their readers, knowledge of events in every part of the world. But newspapers do more than furnish news. They constitute a factor containing the elements of evil. One of the greatest evils of modern times is government by newspapers. Newspapers constitute a menace to human liberty. They invade the private homes and disclose the affairs of the family. They foist on the public, despicable characters, and destroy the reputation of numerous men and women. They render verdicts in murder cases and are often instrumental in the conviction of the innocent. The court is careful to prevent conversation with jurors, fearing that thereby they may be prejudiced against defendants. Newspapers reach jurors before they are impanelled. Sensational re-

ports often determine beforehand the fate of the accused. Politicians are made and unmade by newspapers. Public characters are at the mercy of editors and reporters. Let any man undertake an honest fight against interests favored by the press, and editorials will be written to destroy his reputation if possible. Politicians fear the newspapers, for they are creators of sentiment; and false sentiment is often the dominant product. Newspapers constitute a phase of tyranny which should be abolished or changed. Not that newspapers should cease to exist, but that they should occupy their legitimate plane and field of work. The evils of private conduct of newspapers are numerous. The time is coming when newspapers will be conducted under the impulse of a new spirit; their conduct will be under the supervision of the Government; and they will be published for the benefit of the people, and not in the interests of private ownership.

RUSSIA'S PENAL CODE.

A sentence to Siberia appears to be as bad now as it was in the past. A prisoner in a letter printed last month in the St. Petersburg newspaper, "The Russ," thus describes the treatment of the prisoners on the road. "We passed our first night in the open, on the shores of the Amur. We were ordered by the escort not to talk, not to lie down to sleep, not to stir. No supper was to be had. It rained in torrents, and we were all wet thru. When morning came our fetters were knocked off, and we set off for the camp thirty-two versts distant, dragging after us the bags containing our luggage, for no carts were provided for baggage transport. The first verst was covered without incident; but as soon as the village was out of sight the escorts got to work with the butt ends of their rifles, urging the party on with blows and curses. One of our comrades fell in a swoon. Another fainted soon afterward. Both were lifted into a cart provided for the use of the escort. This particular party of prisoners were set to work on a wheel road. The work is hard, and the conditions of work are harder; but the hardest of all are the beatings. You are beaten on the way to work, at work, and on the way home—beaten always and everywhere. Beaten for unwillingness to give up your bedding to the Cossacks, beaten if you put on clean clothing; beaten for wearing spectacles or a pince-nez; beaten for no reason at all. No difference whatever is made between state prisoners and ordinary criminals. Men preferred to be put in prison rather than work in the camp, and when once there they would cut off their fingers, maim themselves, or drink tobacco juice, in order to remain. Two men cut off the fingers of their right hands. Another crushed his hand beneath a wagon. I know men whose most sacred, unattainable dream is to get into prison, to wash in the bath-house, and to be allowed to put on a clean shirt."

THE CHARITIES OF 1907.

About \$120,000,000 were given to various good causes during the year 1907. Of this more than \$61,000,000 went to education, of which John D. Rockefeller contributed more than one-half. Altogether, Mr. Rockefeller gave \$42,315,000 during the year. Mrs. Russell Sage gave \$13,830,000; H. C. Frick and P. A. B. Widener, each gave \$10,205,000; Andrew Carnegie, \$8,957,000, and Miss T. Jeanes gave more than \$2,000,000. Women gave about one-fifth of the total sum. Fifteen persons, four of them women, each gave a million dollars or more. Some of

the leading gifts of the year were the \$10,000,000 given by Mrs. Sage for general philanthropies, with the especial thought of investigation of the causes of poverty; the \$1,000,000 given by Miss Jeanes for negro schools, and the \$2,000,000 given by Mr. Rockefeller, for medical research. Next to education, the greatest sum was given for galleries and museums—\$22,000,000. For miscellaneous charities, \$15,186,300 was given; for hospitals, homes and asylums, \$7,882,500; for churches, Young Men's Christian Associations and home missions, \$6,265,000; and for libraries \$2,132,000.

ACCIDENTS IN COAL MINES.

The American people have the characteristics of a sixteen-year-old boy, who will not learn from the experience of older people. It is only when he finds out for himself that late hours make tired men and that wearing low shoes in winter means catarrh, that he is willing to agree that his father was correct. The American people in regard to the currency, in regard to safety appliances and rules on railroads, in regard to the regulation of corporations, show exactly the same stiff-necked stupidity as does the silly, headstrong boy. The present lesson we are receiving in the hard school of experience is the need of safety measures in coal mines. In the first half of the last month three awful explosions occurred; one in Pennsylvania, where thirty-two lives were lost; the second at Monangah, W. Va., where nearly four hundred men were killed; the third at Yolande, Ala., where sixty-one men died. In the same week as the third disaster, the Interior Department issued the results of an investigation into accidents in coal mines. In the last eighteen years 22,840 men have been killed, and over 50,000, more or less, severely injured. The number of killed each year has increased from 701 in 1890 to 2,097 in 1905, and 2,061 in 1906. Last year nearly seven thousand men were killed or immured in the mines. The report received a terrible emphasis through another great mine explosion which occurred on the very day of its publication. The lives of at least 175 men—how many more is not yet known—were lost in a disaster in the deep Darr mine, forty miles southeast of Pittsburg.

THE SITUATION IN PERSIA.

In Persia, where a constitution was granted and a parliament instituted in 1906, there arose in the past month a conflict between the reactionaries and the parliamentary party, which, for a time, threatened serious bloodshed. Although the leaders in the original movement for a parliament were priests, certain of the clerical party have become reactionary and brought their peasant supporters into the capital. Although the new Shah had sworn allegiance to the constitution on Nov. 12, the parliament was convinced that he was preparing to abolish it. In their extremity the constitutionalists issued a manifesto to the world in which they said:

"When the affairs of the empire had fallen into a hopeless state, the nation saw its only salvation in constitutional government. The late Shah granted a constitution, and the reigning Shah confirmed it, but persons, who, under the despotic regime, were accustomed to oppress the people, misled our young sovereign into the belief that the constitution was the cause of the present trouble. The nation wants to do nothing that will disturb peace, but in view of the attack of the reactionary members of the government it will defend the constitution, its only hope, to the utmost.

The Russian and British embassies have been working in concert to prevent trouble, and, largely through their good offices, the armed supporters of each side have left the capital, the Shah has appointed a new ministry, with himself as prime minister, and apparently Persia will continue its parliamentary experiment.

THE INGLENOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

LONG ARTICLES.

Who likes to read long articles? Well, let them write them and read them both, for INGLENOK readers like short, spicy essays.

There are two kinds of long articles. One, the common kind, is the empty kind, wordy, prospective and ends like the point of a lead pencil.

The other, a rare kind, is full from the first word and increases in its charm until the end. If some one can write such an article let us have them, but do not think that because some one else who has spent forty years in reaching one conclusion, writes such an article once in ten years, anybody can do the same thing ten times in one year.

We call for more short, lively articles.

SOME INSTITUTIONS WHICH ARE NOT NEEDED.

1. SALOONS.
2. Stock Exchanges.
3. Theaters.
4. Dancing schools.
5. Gambling resorts.
6. Horse races.
7. Brutal athletics.
8. Mob violence
9. Bawdy houses.
10. Oath-bound secret organizations.
11. Lobbies at Congress and Legislatures.
12. Lotteries and machines of chance.
13. Book-makers of bets at public games.

GETTING RICH ON JIMSON WEED.

A PREACHER in Kansas got tired of his small salary and went to gardening near Witchita. The preacher was energetic at his work and his location in the river bottom was ideal for gardening.

Wichita is a good market for almost everything,

but it is especially good for mangoes; so this preacher put out a large quantity of mango plants.

Their growth was so heavy that he called in his friends and neighbors to see his thrifty mangoes. A fat living and a full pocketbook were already in sight for him. He engaged mangoes all over town. But when his plants got about waist high they began to bloom, and behold you, every mango plant proved to be a jimson weed.

That preacher went back to preaching pretty soon after his jimson weeds bloomed, and he is still at it, doing a great work.

Moral: If you have found your place in life, stick to it, or else you may cultivate jimson weeds, also, sometime.

WHO WOULD BE ELECTED?

Two men run for Governor. One heads the Republican ticket and receives 100,000 votes. Another man heads both the Democratic and Socialist tickets; receiving 95,000 on the Democratic ticket and 20,000 on the Socialist ticket. Which man will sit as Governor, the man who receives 100,000 votes or the one who receives 115,000?

WILL YOU ANSWER THROUGH THE INGLENOK?

ARE people justified in patronizing mail-order houses in preference to giving their trade to home merchants?

Should women receive equal pay with men for doing equivalent work?

MONEY PANIC VERSUS INDUSTRIAL PANIC.

THERE are various kind of panics. Properly speaking, the present panic is a financial panic, pure and simple. It is neither a money panic, nor an industrial panic, although the two last may grow out of the present one.

A financial panic is one in which investment is the dominant disturbing factor. The stock exchanges of the country are generally the disturbing centers in this kind of a panic. Last spring there was one week of financial panic in New York City, in which stocks in nearly every ware went tumbling, but the crash did not seem to reach very far, so that failures did not become general over the country. The present financial panic, which also started in New York City, seems to have involved individuals and corporations in every direction, especially in the northern states and caused their downfall. Investment, as an investment, in anything just now is not advisable until we see whether our money and our industrial systems are going to stand the test.

In 1893 and a few years afterward, we had a money panic. The amount of money per capita then was thirty-five per cent less than it is now. Prices were

low; the amount of money in circulation was also low, even when compared to the amount per capita. Our small export trade was causing a deficit in our national income, so that even our federal treasury was depleted until bonds had to be sold in order to pay the running expenses of the nation. That was a *money* panic. But now our government has six times as much money in the treasury at Washington as it had then; the export trade is at the highest tide in our national history, and our clearing houses never showed so much money in circulation.

The thing to be feared at present is the third form of panic, namely, an *industrial* panic.

When this comes then people really suffer and violence and crime often follow. As long as the mills and factories run, the laboring classes can make an honest living and are generally satisfied, but when the factories close and people become idle, trouble in one form or another is sure to come.

Investment, as a business, is confined to a few people, but labor as a means of living affects the bulk of 90,000,000 people, so that an industrial panic is the one to be feared mostly. And, again, the industrial panic cannot be brought on by the laboring man. The *investors* first start panics among themselves. This disturbance then affects the money markets, which in turn compels the factories to close and this in turn forces the laboring man out of employment. Then business gets dull and hard times come in earnest. Production, labor, and markets all become affected then together.

Latest indications are that the present stringency will remain a financial panic only, and that the industrial world will soon be normal. Factories are opening up with full force in nearly every quarter.

DID NOT DO MIRACLES.

A LITTLE town near Providence boasts a church whose pastor, besides being an eloquent preacher, is a man of stalwart proportions. At one of his evening prayer meetings the services were disturbed by two young men who audibly scoffed at everything they saw or heard. Finally the pastor remonstrated with them on their behavior, and asked them why they attended the meeting.

"We came expecting to see miracles performed," impudently replied one of the rascals. Leaving the desk and walking quietly down the aisle, the pastor seized one after the other by the collar, and, as they disappeared out of the door, remarked: "We don't perform miracles here, but we do cast out devils."—*Boston Globe*.

PRACTICE the art of deciding what to do. He who never comes to a point will never come to anything.

A CROSS STICK.

ADALINE HOHF BEERY.

Take the plaguey thing away!
Has that paper come to stay?
Every time I get my specs,
It's the first my sight to vex;
Now it's lying on a chair,
Grinning like a grizzly bear;
Look how cunning it can be,
Elbows sticking out in glee;
Nodding from the parlor shelf,
Oh, the saucy, brazen elf!
Only men with wits unsound
Keep such papers lying round.

THE STICK'S NEIGHBOR.

Truly, friend, I grieve to hear
How you twist this meaning clear;
Even men of sense will frown
If their paper's upside down!
Now just see these breezy bits
Gathered from all nation's wits;
Lively tales of country Jakes,
Even rules for flannel-cakes;
Nothing shabby in it all,
Only brains wrapped in a ball;
Open out the curious thread,
Knot it fast inside your head.

Huntingdon, Pa.

LEARNING TO SAVE.

The old truth, "Save the pennies and the dollars will take care of themselves," is shown by the fact that thirty-seven thousand dollars is the sum which school children of Columbus, Ohio, have in savings accounts in their own names, as a result of penny savings in the schools. Twenty-six thousand dollars of this is in the State Savings and Loan association, and \$11,000 is held by the Park Building, Savings and Loan company.

The \$37,000 is divided into more than 30,000 accounts, varying in size from 50 cents to \$150. In some cases the individual deposits have grown to as much as \$300, but these cases are very few.

The Park company reports savings this year to be coming in at just about the same rate as last year—\$85 to \$100 a week—while the State association reports a slight increase, collections being from \$200 to \$300 a week. November is one of the heavy months, while December, of course, is one of the light ones. The youngsters use the most of their money in December for buying Christmas presents.

The plan is one whereby the school teachers sell to the students stamps, valued at one penny each. These are pasted in folders until fifty are collected, then they may be taken to the loan associations and either deposited or traded for cash. It takes more than a million stamps and from 25,000 to 30,000 folders annually to supply the schools.

Nature takes care that no man gets morally, intellectually, or spiritually rich by sitting still and letting things pour into his lap: Wealth in these imperishable things is a matter of time for every man and woman; and time is not given; it must be made. If you want time for great tasks, for fine growth, for beautiful accomplishments, for rich resources of all sorts, do not wait for it; it will never come to you; make it by selection of design, concentration of effort, the vital skill that is born of devotion, intelligence, putting one's heart in one's work.—*The Outlook*.

A Table Conversation

Flora E. Teague

"MA, guess what I saw John doing this morning," said the father.

John was the eldest of a family of several children. He was a fine lad, innocent and honest, helpful and kind-hearted, though somewhat bashful; a son for whom many parents might be grateful. Having heard the same kind of joking tone from his father before, followed by more or less merriment at his expense, when some of his innocent and harmless deeds were blazoned forth for the family's delectation and amusement, John's heart fluttered, his face reddened and he became almost ludicrously awkward.

"Well, pa, what was it?"

Too eager to quickly unload his tale that he knew would call forth much merriment, "pa" did not wait for "ma" to guess, but replied:

"Why he had Mary Andrews on his sled hauling her to school as if she were the daintiest girl in the neighborhood!"

At this, his younger brothers ha-ha-ed quite loudly as they were expected to do. John's heart beat more rapidly, his face reddened and down to the floor dropped his knife, followed by the over-tipping of his glass of water. Then the fun was on in earnest.

Now, Mary Andrews was a big overgrown girl, larger if anything than John, yet his junior by a year or two. She was a somewhat unattractive girl because of her bigness and accompanying awkwardness. She was the butt of many jokes and pranks and whoever befriended her in any special manner came in for a feast of tormenting taunts.

John, who had accidentally overtaken her on his way to school in the morning, began a conversation with her which both seemed to enjoy. Finally, in order to test the good qualities of his fine, new sled, of which he had been talking, Mary bantered John for a ride. Now John,—who was too gallant, and kind-hearted to refuse, started off with her. Just then it so happened that his father passed by. The father had a humorous twinkle in his eye that was not lost on John, so that when his father began upon him at the supper table, John knew well what was coming and chafed under the

embarrassing situation. Neither of the thoughtless parents dreamed they were not only wounding deeply the heart of their son, but also were causing him to grow painfully awkward and bashful. When he became a young man, he was so timid in the presence of strangers that it was pitiful to see his awkward conduct. Some few did pity him, but more rudely laughed. Ere long John had a nickname. It was "Bashful John." Oh, the pain it brought him. How bitterly he resented the thoughtlessness of his parents whom he felt were strongly to blame for bringing about so much unpleasantness for him.

Parents, whoever you may be, be careful how you thoughtlessly wound the feelings of your children. Instead of ridiculing their innocent acts, even though they may amuse you, encourage them in every kind act. They will form an enviable character eventually.

It is such an unfortunate thing to be so bashful as to be awkward. Still more unfortunate is it to be made so through the cruelty of those near and dear to us.

Lordsburg, Cal.

THE NEW YEAR.

JENNIE TAYLOR.

To many of us it does not seem long since the bells rang the "Old Year out and the New Year in," but almost before we can realize the fact the past year has grown old and died and another twelve-month has been ushered in to take its place.

Again the first of January—time when more lists of the proverbial "good resolutions" have been made, which are only to be soon forgotten, or broken, even before the next day's dawn. But whether we have made a new list of good resolutions or not, we know that each day of the New Year must be lived through in some way if we occupy any place in the world at all. And each of these days is sure to bring something to each one of us. That something may be the same routine of daily duties, or difficulties to be overcome, or glorious opportunities for doing somebody some good.

Whichever it may be, much of our success in accom-

plishing any of these particular tasks will be due to our own decisions. Much will depend upon our own selves. Each individual has something to do with bringing about much of his or her own success or failure, although many things will happen that no previous thought or care can possibly prevent, and it is for these reasons that we are eager and hopeful, or thoughtful and reluctant, in welcoming the New Year.

Then let us look forward to each coming day with a firm hope and a steady resolve to make this a good year, for we can do much to make it so if we will. And should we meet with difficulties, let us meet them bravely. Let us be determined to surmount all our obstacles as best we can and so press onward and upward to greater heights and a fairer view, else the multiplying circumstances will be crowding hard against us. We cannot come to a standstill. We must further our progress or fall back in the onward march through life.

The Old Year is like an old well-worn volume whose closing page we have just finished. And if we have made any errors in it which we cannot erase, we must leave them all to Him who understands our struggles and cares best for us.

And the New Year! It has come to us like a new book, unstained and white, upon the fair pages of which we may record more joys than sorrows, more gains than losses, more fulfillments than disappointments. Who shall say? Anyway let us lay aside all that which tends toward discouragement, take heart with the New Year's chimes and begin again.

Tipton, Iowa.

A LETTER.

LULU C. MOHLER.

DEAR JANICE:—You write that you don't like my letters! Well I have thought a great deal about that, and I have analyzed it thus: You had never before received a letter from me, though we have known each other since the beginning of time—our time—and you expected certain things of me. Then, too, the letters were not like my conversation, perhaps they sound more careful and guarded.

That is the kernel of the idea. Letters, like literature, are a failure unless they reflect living in the concrete reality. Letters will reflect in a more lasting way than spoken thoughts and precepts.

I have here by me, packages of old letters—musty and faded with age. They were not penned to me, but they are just as precious, for they are voices from the dim, somewhat forgotten long ago. They were penned by a young girl in 1864. The writing is clear but very small and neat. Girls are not of just one type, but perhaps you might find some of her type in 1907.

She wrote of photos—she called them—tintypes we

call them. She sent love from her Maryland home to the cousin, and the many acquaintances she had made when visiting this cousin in far away Ohio. She has many paragraphs about beaux and handsome soldier boys, interspersed with information on the weather, reports of progress at school; but an *undertone* of beaux through it all. As Lady Bettie said, "Just as when you are near the sea you hear it through every other sound."

Next I have a rather large bundle of old, old letters with a cry of sorrow from one woman's soul to another. You would cry over these letters, and though you never knew the writer you would know she was one woman whom sorrows and trials had crushed and sorely wounded. It seemed to me that one could touch those letters with the finger-tips and feel love throb, like pulse, through all this woman's being.

I think of little Lady Gentleness whom we know and adore for her quaintness and quiet charm, but one finds in her letters a soul with a depth of feeling that awes one, and you have a desire to bow the head and remove the sandals from the feet.

She is a girl that I love,—though *you* will not surrender to her witchery. She is spontaneously sane and natural. Such letters! One is bewitched, and when it is finished you lay it down, ready and in the mood for some girlish prank. You feel like a real, live, fun-loving girl, with the good red blood pounding through every vein, with witty retorts ever ready, and you realize how foolish it is to be prim and priggish, though there is plainly felt the undercurrent of steadiness and sense,—the high aims and well-educated love of the good and true.

Strange, but your letters are just like you. They tell little, just your strong self-concealment—called reserve. But oh, you are as loyal and true as the angels.

I can see you raise your eyebrows and smile with an aggravating air. "Um, she does not tell of her understanding of a man by the letters he writes." Ah—

I don't know much, but I have found he feels deeply and keenly and says very little about it.

May we live so richly, so honey-laden,
But such a tide, as moving, seems asleep;

Too full for sound and foam
When that which drew from out the boundless deep,
Turns again home.

Leeton, Mo.

GIVEN a hot head and a cold heart and you have a fool. Given a hot head and a warm heart and you have an enthusiast. Given a cool head and a warm heart and you have—a wise teacher.

Children's Quarrels

Catharine Beery-Van Dyke

It seems a pity that right after Thanksgiving and Christmas time this subject should be suggested. Let's think why.

The Christmas holidays follow so close on the heels of Thanksgiving that we have practically three holi-

period it is easy for children (children alone, think you?) to get out of harmony with one another and their surroundings.

Another thing. It will be noticed that, in connection with these three particular holidays, the idea and custom of enjoying sumptuous meals prevail, and this has also a tendency to result in the disturbance of temper.

In the third place, it is also customary at these times to mingle more with friends outside the family circle, and so social life runs higher for a time than usual.

This much for the cause. Symptoms come next; and these are demonstrated, sometimes, in feelings and acts of depression of spirits; peevishness, sullenness, bad humor and very often outright bickering and backbiting in the family. Nature demands her right of way and will have it by fair means or foul.

A divine provision in the affairs of human life is that one cannot always dwell on the heights; and also, thank God! that there is no grief, no sorrow, nor affliction, nor hatred so intense but that the healing balm of Time will at least alleviate and often entirely cure.

And now comes the process of readjustment; a process both necessary and somewhat difficult. Here can be used the wise parent's or guardian's previous provision for going up into a good time, and for guidance during the descent from it into the ordinary routine of living.

If this forethought has been taken, many an unpleasant dispute and lack of self-control will be avoided.

At this readjusting point I would advise first to pay some attention to the diet. After the unusually big meals, provide those who surround your table with

days to deal with, crowded into the space of about six weeks. As each has a decidedly characteristic meaning, it keeps even us big folks busy to keep our bearings as to their significance and to hold our temperamental poise through their celebration.

When one looks forward to some interesting approaching event he is more or less inclined to dismiss the commoner thoughts from his mind. The season or occasion to which he looks forward is exalted to the suppression of the ordinary experiences that must be lived through in the meantime. The longer the tension lasts, the closing of the looked-for eventful day will be the more abrupt, and when a person realizes that the time has been reached and just passed—forever passed—he finds himself unprepared to drop back at once into the commonplaces of living. It takes some time then for readjustment; and during this

some light, nutritious, plain food and keep it plain for several days. Otherwise it may be necessary to lavishly, and variously, and promptly administer the delicious (?) contents of the castor-oil bottle before all disagreements are finally settled.

In the second place, fresh air is a very helpful agent in obliterating discord. I read of a mother who threw open the window "to let the crossness out." It was effectual.

A third power in regaining equilibrium is exercise. Now if there is a new apron to finish or some other piece of apparel really desired, (and if there isn't, provide one forthwith) set the girls to work on it. Provide equally interesting and necessary outdoor work for the boys and in a day or so—in a week at least—the atmosphere will have become perfectly wholesome, safe and enjoyable, all other things being equal.

In thus providing for the pleasure and benefit of our children, we cause our own sadness, and irritation and ill-humor that we, too, are prone to, to

"Fold their tents like the Arabs
And, as silently, steal away."

Now, some will say: "Well, these directions may answer pretty well for holiday quarrels, but how about the chronic, everyday kind?" Let me say that these principles can be generally applied.

Here, too, we must look for the cause of trouble ere we can intelligently deal with it. If it is simply (or rather gravely) habit, the fault probably lies with your method of dealing with your children. When we, as parents, are selfish and exacting before and with our children, we may look for the same low principles to develop in them. If we are interested and sympathetic and painstaking they will be just as likely to follow our example in these good qualities and will be far less likely to speak harshly and to act rudely to each other.

If quarreling breaks out, or persists, it is sometimes a good plan to deprive the parties of each other's association for a time. Divert the attention or change the occupation.

If the virtue of usefulness and the habit of courtesy are developed in the family during the real tender years the heartaches in later years will be fewer.

I was much consoled one time when this subject was weighing somewhat heavily upon my mind. I was in conversation with a happy mother of eight children, at this time nearly all grown up. I said to her: "Did it used to worry you when your children quarreled?"

She looked up so proudly and speaking my name said: "Did you ever see idiots quarrel?" I never had, of course, and nobody else had, for I learned that this proclivity belonged to children of sound mind.

(Continued on Page 66.)

“The Public and Its Rights”

P. C. Hiebert

THE centuries which have swept across the face of this globe, all have a history to relate. With the death of their last moment they have buried the weal and woe of myriads under the unmovable fold of their dark mantle. If their dumb mouths should be opened and the palsied tongue of the silent ages loosened, men would tremble and sympathetic nature would shudder at the heartrending cries of the tortured, the hopeless plea of the oppressed or the faint moan of the dying. If

“The tumult of each sacked and burning village;
The shout that every prayer for mercy drowns;
The soldier’s revel in the midst of pillage;
The wail of famine in beleaguered towns;

The bursting shell, the gateway burst asunder,
The rattling musketry, the clashing blade;
And ever and anon, in the tones of thunder
The diapason of their cannonade.”

break through the ocean of forgetfulness and bring us tidings of forgotten woe and lauded deeds of gallantry, it unveils before us a great panorama, exhibiting struggles for life and rights. Where history here and there lifts the great veil and gives us a momentary peep at the secret of the years, we cannot but detect that the whole is one great story of man’s struggle for his birthright. It is a struggle of individuals, sometimes united but often divided; still their interests are common, and they help others rise from the dust of oppression and the mire of superstition.

There is not a page of history which does not cry in a loud voice: “Man should be free!”; there is not a single country whose career has not written in letters of blood, “The people are destined to rule”; and the basic nature of man’s intellect and power stamps him as the master of the universe. He is not to be subservient to anything or anybody, but lord of all. He is ruler by nature. Therefore man has ever and anon been striving to liberate himself from all oppressive rule. He has deemed it but legitimate that he should have a voice in the governmental organ that controlled his fortune and determined his well-being. And we find through all the ages that the people have risen in rebellion with sword and word, to free themselves from tyranny and oppression. Greece had its Solon, Rome its Brutus, England its Cromwell and America its Washington. Stout-hearted, liberty-loving patriots have gladly and gloriously laid down their lives and died (with words) like Nathan Hale, crying out at the moment of death, “One thing I regret, that I have but one life to give for my country.”

The people in most countries of the world have already thrown off the yoke of despots and in others the

tragedy of autocracy is performing its last act of treachery, while “rigor mortis” is creeping up its limbs. Governments founded on the corpses of their subjects can no longer survive when the spirit of the age crieth aloud, “O ye dry bones, hear the voice of freedom; behold I will cause breath to enter into you and ye shall live.” The fountain of red gore refuses to fertilize the fields for tyranny to flourish. Might shall no more make right, but the light of righteousness shall have might, and knowledge will be power. The race has come to maturity and is now claiming its just dues. Nations have shaken the shoulders of their strength, and divine rights of kings crumbled to dust; man has said, “Let there be light,” and the very bowels of the earth speak forth the secrets of the ages, the heavens have cast off their veil and the countless solar systems of the universe declare the glory of God. Human reason stands on its permanent throne, and nothing seems hid before its piercing gaze, even the mystery of life is trembling with anxiety for solution.

Man has virtually claimed the world as his own, he has disarmed the forces of nature and makes them do his bidding. Steam and electricity are his slaves, earth and sea the bases of his operations, sun, moon, and stars his bodyguard, and the Infinite his associate in shaping the destiny of the human race. But, in the ecstasy of his supremacy, man has created himself a god, who has become his rude master, and man himself has been humiliated to be the slave of his own handiwork. In the wonderful prosperity of the nineteenth and twentieth centuries man has amassed fortunes, created immense stores of wealth, which he pretends to possess, but in reality they possess, control and enslave him; for the almighty dollar has been crowned “Lord of All.” Nothing can be hid from its mighty influence and none would dare to oppose its unlimited power. Why, it makes and unmakes kings! It elects our public officers, makes our laws and interprets them! The silver certificates entering into the pockets and amalgamizing the brains of judge and jury have changed many a verdict. Thus the magic jingle of the dollar makes guilty innocent and innocent guilty. It dubs wrong right and knight, while justice standing behind a dark curtain has its tears wiped away by \$100 bills.

So eager are men to serve that they run from morn till night in order to become bodyguard of their yellow master. They bathe in the sweat of their brows, saturate their pillows with the deadly poison of worry and weld numerous barbs into the lash of remorse,

which conscience flings with relentless energy at every moment of its consciousness, and to all this man gladly subjects himself, just so he makes a little money in the bargain. King "Dollar" is cruel enough by himself but the greater evil of the two has arisen since he has intimately associated himself with a favored few of his closest and most faithful servants whom he uses as instruments of oppression. In coöperation with their heartless master some few men have been able to get control of the generous provisions and treasures which nature has prepared for all her children.

What a wonderful gift has man in that glorious fiery orb which rises, shines and quietly sets every day; and how soothing and love-infatuating is the pale light of the moon, and the little stars, with their merry twinkling, how they do inspire the oppressed, the weary and worried, with hope of better days. These blessings are ours in common, with no monopoly on them. The balmy air has no master, the sea with its unfathomed riches is shared by all alike; and only earth, the mother of us all, with her innumerable treasures is welded to the necks of a few by chains of silver and gold and thus producing monsters more powerful than Mammoth and Leviathan. These unnatural forces which control more votes, shape more legislation, exert more sway over the minds of our courts than any other agency are but a conglomerate of silver and gold, sprinkled with human brains and saturated with fiendish greed of gain. They pass by the name of Corporation. They are rulers that have no soul, therefore no conscience and no intelligence except to foster their own ends. "Property is power where intelligence should rule supreme."

Corporations water their stock, thus selling wealth that does not exist. They give rebates which defy the law and defraud the community, and thus cause wreckage far greater than the worst riots. They force man into privations which induce him to violence and petty larceny. Revolting victims, leaders of riots and petty robberies languish in the loathsome dungeons behind iron bars or stand on the gallows with a rope around their necks and the black cap drawn over their eyes while the bereaved widow, amid floods of tears, wrings her hands in death agony; barefoot boys and half-dressed girls cry, "Bread, bread, mother, bread;" and the blue-eyed darling from its manger of rough boards pitifully sends forth its unavailing heartrending cries. At the same time the wholesale robber, the murderer of the wretched victim is sent to congress to wear silk stockings and procure legislation that will foster his diabolical purpose. His wife and daughter strut about among the famous four hundred, being clad in silks and costly raiment. Their bodies are decked with gold and adorned with diamonds. They fare sumptuously every day. Brethren the voice of our brother's blood crieth unto heaven, the wail of de-

spairing womanhood pierces our hearts, and the cry of the helpless babes grates our nerves. Such atrocities demand decided action and immediate action on our part; for verily we are passive supporters of the crime unless we do our duty to alleviate it, and do it unhesitatingly. Suppose the crying babe were the idol of your own home, and let the misery of the tenement-house women touch the most sacred chords of your sympathy and cause them to vibrate in unison with the heavenly chorus, which sings peace, love and good will to all men. Fellow citizens, let me appeal to your merciful hearts! Let me move you to action for the sake of the helpless and the oppressed! I would not rouse you to any rash deed, for these soulless corporations are composed of fellow-men with feelings and emotions like ours, but Rome was aroused to fury when they beheld Cæsar's dead body with gashing wounds, and how could we rest quietly when the middle-class, the country's resource of brain, brawn and nerve are pushed to the wall and the laboring class, the backbone of our nation is trodden under foot! Could we be at ease when our brother is dying? Or dare we stand by to see the octopus of wealth gradually but surely embrace the vitals of the nation with his flabby but irresistible arms, and draw the lifeblood from the worthiest of our citizens?

Among those suffering under the sway of these corporations are thousands of our citizens, are the greater part of our nation, are you and I. It is not a single man's cause, nor that of a few but it is the general public that is crying for its moral and constitutional rights. I have appealed to your sympathetic emotions but I would not that ye were carried away by impulse to deeds that reflection would not justify. I ask for your unbiased attention and sound judgment. We dwell in the land of the free and the home of the brave. We boast of our freedom and nations laud our bravery, but does freedom rule supreme when money and a few control the ballot box, obstruct legislation and send haggard starvation to the poor man's door? If such is liberty and freedom then be it far removed from me, but beholding it—tyranny and oppression, then I appeal to your reason, your manhood, and your sense of justice. To arms! for your country needs you! It is your dying brother who cries for help, it is duty that calls you to action and justice demands your support. Again I say, "To Arms," yet be they not firearms but the arms of justice and the law.

The sacredness of individual property is respected by all true citizens. The immunity of our possessions is one of our inviolable birthrights, and yet when the possession of the same is deemed to the best interests of the public, the law of eminent domain justifies the appraisal and seizure of the same for the common good. Thus the individual must yield to the laying out of townsites, streets and alleys as well as to the right

of way which the railroad claims. The best interests of society limit the right of the individual possession even in a harmless state, how much greater right has the public to seize and control resources which are used illegitimately and in such a way as to menace the welfare of the race. Caiaphas said, "It is better that one man die than that the whole nation perish." The benefits of the many outweigh the claims of the individual, and he who uses wealth to the harm of his fellow-men forfeits his right to the control of the same.

Every citizen has a right to personal freedom and yet when anyone misuses this to the harm of his fellow-men, the law puts him behind the bars and robs him of his liberty. Why? His freedom was a menace to the public. The rights of the individual conflicted with the rights of the public, and the just verdict read, "He who breaks the law of the land must suffer for it." The criminal justly forfeits his right of freedom, for none would dare to maintain that the professional outlaw does not by rights belong behind the prison bars. Fellow citizens, if abuse of freedom forfeits the possession thereof, does not illegitimate use of wealth and resources forfeit the right to control the same? If corporal freedom is denied for the sake of the public, should property be inviolate?

Observation has demonstrated and courts have proven that corporations, by monopoly and swindling, have trodden under foot the rights of the public. They have employed their influence and wealth as the burglar employs his liberty. He defies the law and robs the man at the point of his sword. They run the gauntlet and freeze the competitor out and starve his family by means of monopoly. The burglar loses his freedom, why shouldn't they by a similar deed deprive themselves of the control of their wealth? They violate the laws of God and man by using money as a weapon of offence. Their control of wealth is a nuisance to the public and it should be taken from them. My countryman, something must be done. The issue is before us and awaits our solution. Shall we procrastinate action until many have perished and thousands have suffered, or shall we slay the viper before her deadly work is enforced by another sting? Shall we wait until sheer necessity and agony drive us to action or will we contend for principle ere the calamity has come? Is not principle the highest motive and the strongest basis for any righteous struggle? As loyal subjects of our glorious country and followers of our noble flag, we must stand for the enforcement of our laws, and labor to secure immediate legislation, that will bid monopoly halt, and bridle the tiger of greed and licensed robbery with iron reins! Friends, dare to stand for a righteous cause, even though it promises no glory, and rewards with reproach and criticism! For

"Then to side with Truth is noble when we share her
wretched crust,
Ere her cause bring fame and profit, and 'tis prosperous
to be just;
Then it is the brave man chooses, while the coward
stands aside."

I do not know what you may say, but as for me, here is my heart and hand to stand for truth and contend for principle 'midst honor or disgrace, and shout with word and deed, take justice from the scaffold and corporations from the throne!

Dallas, Oregon.

CHILDREN'S QUARRELS.

(Continued from Page 63.)

Do not think, mothers, that yours are the worst children—nor the smartest—because they quarrel, but keep on using the most rational and always the most Christlike methods you are able to do and leave the rest for Time and God to develop.

CURIOSITIES IN NUMBERS.

Some very curious facts have been discovered about numbers, which to a professor of mathematics might seem simple enough, but to the average person certainly appear remarkable.

Nine is perhaps one of the most mysterious of numbers. If we multiply 9 by any number under 20, except 11, the sum of the digits in the product will always be 9. Thus:

9x2 equals 18, and 8 plus 1 equals 9.

9x3 equals 27, and 7 plus 2 equals 9.

9x4 equals 36, and 6 plus 3 equals 9, and so on.

Another queer number is 37. If 37 be multiplied by 3 or any number of threes up to 27, the three digits in each product will be alike. For instance:

3x37 equals 111.

6x37 equals 222.

12x37 equals 444.

15x37 equals 555, and so on up to 27.

Thomas Nelson Page, while riding down a country road in one of the Southern states of America, met an old negro leading a horse and laughing uproariously.

"Sam," said Mr. Page, "what's the joke?"

"Oh! Mawnin', marster. I jes' won a bet offen dis hyeah fool hoss."

"Why, Sam," said Mr. Page, "how did you do that?"

"Well, you see, boss, I was a-leadin' dis hyeah hoss back yonder, and I seen a piece of paper ahead of us, an' I says: 'Blacky, I bet yer a quarter yer gwine ter be afeard of it.' But Blacky shook his haid—he wouldn't. Then I said: 'Blacky, I bet you a quarter you will—will you take my bet?' And he nodded his haid. Well, sah, when we git up dar, de wind flutter dat paper about, an' Lord bless my soul! you oughter seen dat hoss. He shy clean outen de field. Ha! Ha! Ha! An' dat's what tickles me—dat I'm a quarter ahead."

"Why, Sam, you are crazy; you can't collect the quarter from a horse."

"Yassah, dat I can! My marster he'll give me a dollar tonight to git oats and hay fer dat hoss, but I'll git him 75 cents' wuth and keep my quarter. Ha! Ha!"—
Illustrated Bits.

♥ FOR THE COOKS ♥

SOUPS AND BEVERAGES.

LENNA FRANCES COOPER

Director Cooking Department of Battle Creek Sanitarium.

THE chief constituent of soups and beverages is water, a substance which is essential to life, since our bodies are almost three-fourths water.

According to Hutchison, an English author on food and dietetics, about $4\frac{1}{2}$ pints of water are used by the body daily, which, of course, must be replaced. A part of it is replaced by the water in our foods. Almost all of our foods contain some water and many of them contain as high as 90 per cent water. It is estimated that almost one-half of the amount needed by the body is taken as a part of our food, leaving about 2 pints which should be supplied as a drink. Clear, sparkling water is without doubt the very best beverage, but sometimes we prefer it flavored, which we then call a beverage. Beverages are not objectionable if taken at the proper time and if made from wholesome substances. The habit of drinking large quantities of liquid with the meals is one which is likely to result in injury to the stomach as the large quantity of liquid, together with the food, distends the stomach to much more than its normal size. This condition may become chronic if the practice is continued.

Unfortunately, several of our common beverages contain substances which are objectionable.

Tea, coffee and chocolate each contain a stimulating principle known respectively as theine, caffeine and theo-bromine. These affect both the heart and the nervous system. Some people will say, "I cannot drink coffee because it makes my heart palpitate so." Others say, "I cannot drink it because it keeps me awake." In the one case the heart is the organ most effected. In the other case the nervous system is most effected.

Hutchison says that in a cup of coffee as ordinarily made, there are about $1\frac{3}{4}$ grains of caffeine. A medicinal dose of caffeine is 5-15 gr. At this rate 3 cups of coffee would make a small medicinal dose.

Another ingredient to be considered is tannin, which is found in both tea and coffee. This is a local irritant, effecting principally the lining of the stomach and the intestines.

If tea and coffee are indulged in, they should be made as quickly as possible and without boiling. Coffee made in one of the various percolators where the water is poured over the coffee is the least objectionable form, as this does not contain so much of the tannin, though the stimulant is there.

Tea should never be boiled and the leaves should be removed when it has steeped 5 minutes.

It is far better to discard these beverages and to use instead, cereal coffees, fruit juices, etc.

Soups may be made nutritious as well as appetizing. This is true especially of cream soups. For most cream soups use the liquids in the following proportions: 1 part milk, 1 part cream and 1 part water. If cream is not obtainable then use 2 parts milk and add 1 tablespoonful of butter to 1 pint of milk.

Soups made of dried beans, peas and lentils are very nutritious.

When the remainder of the meal is heavy, a light soup such as vegetable soup is preferable.

For the heavier soups, it is generally advantageous to "bind" them by using 1 tablespoonful of flour to 1 quart of soup, previously moistening it with some cold liquid. This keeps the particles in suspension.

Cream of Celery Soup.

$\frac{3}{4}$ cup of chopped celery	1 cup of milk
$1\frac{1}{2}$ teaspoonfuls of salt	1 cup of cream
1 cup of hot water	2 tablespoonfuls of flour
2 tablespoonfuls of cold water.	

Steep one-fourth cup of celery in the milk and cream and the other half cup in the hot water with the salt until both are perfectly tender. Drain off the water from the celery and add it to the milk and cream.

Braid (rub smooth) the flour with the cold water and add to the other ingredients when boiling-hot. Cook for five minutes and serve.

Fruit Beverage.

Juice of 3 oranges	$\frac{1}{2}$ - $\frac{3}{4}$ cup of sugar
Juice of 3 lemons	1 cup of strawberry or other fruit juice
1 quart of water.	

Drain the juice from canned strawberry, cherry or other fruit juice. Strain the orange and lemon juices and add to the strawberry juice. Add sugar and water and set aside until ready for use. The amount of sugar used will depend upon the degree of sweetness of the canned fruit juice. This is especially nice for evening gatherings.

Cereal Coffee.

$\frac{1}{4}$ cup (4 level tablespoons) of any cereal coffee.
1 pint of water.

Enclose the cereal coffee in a percolator or a coffee sack made of some porous material and immerse in the liquid. Let boil slowly for 20 minutes.

Serve with cream and sugar as desired.

Lemonade.

$\frac{1}{4}$ cup of lemon sugar	$1\frac{1}{2}$ cup of sugar
$1\frac{3}{4}$ cups of cold water.	

Strain the lemon juice, add sugar and water. Stir well, then let stand until the sugar is thoroughly dissolved.

For variation add currant juice for flavoring.

Green Pea Soup.

1 pint can of peas	$\frac{1}{2}$ teaspoonful of salt
1 pint of water	$1\frac{1}{2}$ level tablespoonfuls of butter.

Put the peas through a colander. Add the water and salt and let come to the boiling point. Add the butter and serve.

RECENTLY this question was going the rounds of the journals as a valid problem. What is wrong with it?

Three cattle buyers owned seventeen cattle between them. One owned one-ninth of the herd, another one-third and the remaining one-half. They were puzzled as to how to divide them. A farmer solved the problem by loaning them another cow, which made eighteen head.

One took one-ninth of the eighteen, which is 2
One took one-third of the eighteen, which is 6
One took one-half of the eighteen, which is 9

—
This makes a total of 17

The farmer then returned his own cow to his field. Was this division correct, and if so in what other way can you figure it out?

A SHORT STORY.

RICHARD SEIDEL.

THE visitor, pausing a moment at the curtained doorway, announced to the white-capped maid, that she would wait for the return of the hostess. Long standing intimacy made her free to drop into the cosiest corner of the big couch, and poking the softest cushion into the small of her back, she relapsed into a twilight reverie.

The sudden glow of a crimson shaded lamp was accompanied by a brisk step.

"Here am I! How good of you to wait. Have you waited long?"

"No, indeed. I've been contrasting your comfortable room with another that has come to my notice today, which I must tell you about."

"First wait until I order tea and some of these little chocolate cakes you are so fond of." Now go ahead—some more settlement work, I suppose."

"Yes, I'm full of it. It's my first experience in the realities of life, and it absorbs me. I've been thinking while sitting here, of what little Helen told me today in my sewing class. I asked her what she was going to do this afternoon, and she said it was her day to clean house. She further informed me, that theirs was a very large flat—they had five rooms. There were her father and five children and an aunt who had lived with them ever since her mother died, two years ago; and they always cleaned house Saturday afternoon, because that was Helen's one free day, and she had to help. Poor baby! She is only nine."

"Do you know," replied the hostess, "I think your enthusiasm is contagious. I find myself possessed of a growing interest in these waifs of yours. Tell me what happened this morning."

"Well," the visitor responded, sipping her fragrant Ceylon, "the spirit of mischief seemed to be abroad today, and my children were possessed of some weird obsession which made propriety impossible.

"Finally in despair, I engaged them in small talk—to be sure they were kept diligently at their work—but I kept their minds off of the advantage of sticking pins in each other and climbing over my chair at least. It was an amusing study. During a lull, little Frances remarked, punching the emery cushion viciously: 'Tomorrow's Sunday—how I hate it.' Then Amelia said viciously: 'Why you awful girl—Sunday's a holy day!' 'Well, I don't care,' said Frances. 'All I know is, I have to get up early and go to church.' Then Daisy interposed—and did you ever hear such highy-tighty names? It's really pitiful—as if the only poetry in the lives of these people was all encompassed in the varied appellations of their offspring. Well, Daisy broke in. 'My sister had to go to a home when she was sick. She was sick with her eyes and with her ears, and they put her in a beautiful place, and there were sisters there, and they took care of her and made her all well. She said—Bertha did—that it was just like Sunday all the time, but she liked it. And she was there Christmas, and all the sisters and lots of other people gave her the grr-r-r-andest things! Oh, my! Dolls and a baby carriage, and a little bed, and a little trunk full of clothes, and lots of things. Course, she brought them all home when she got well and played with them, too. I had a good many toys myself, but when I saw hers, mine didn't look so good to me, and she lets me play with hers all the time. So I was thinking p'raps it would be a good idea for me to give my old ones to some poor children that can't afford any better.'"

"Daisy," added the visitor, "wears a faded plaid dress with the raggedest stockings I have ever seen. The requisite white apron, without which no child is admitted to our settlement, is in evidence, and truly it covers a multitude of sins. Patches and many washings are the most conspicuous features, but the apron is glistening with starch and the polishing iron, and her hair is quite immaculately combed and brushed, with each of the two flaxen pigtailed ending in a limp ribbon knot. Obviously, a child of poverty but not of squalor—and she should share her pitiful toys with the poor!"

"Don't tell me another thing," said the hostess, clattering the teacups in an effort to conceal some threatened breakdown. "I'm going to order the biggest Christmas tree I can find for your class, and load it to the topmost branch—so there!"

MARRIED life may be one grand, sweet song, but it isn't everybody that can sing it.

CREAM OF MAGAZINES

MINIATURE CITIZENS OF OUR REPUBLIC.

There is a school city at the Thirteenth Avenue School in Newark, N. J., where a sense of civic responsibility has extended not only to the care of the school building and immediate surroundings, but to the entire school district. There is, for instance, a young truant officer and a street inspector for each street in the district who report any violation of school or city ordinances occurring on their streets.

Suppose, for example, an ignorant immigrant family dump their ashes onto the sidewalk instead of into a barrel. The child who is the school city inspector for that street reports the matter to his chief, the commissioner of public works, the commissioner to the mayor, and the mayor to the principal. The principal then calls to his office the child of the offending parents, explains the ash ordinance, and charges the child to request the parents in future to observe the ordinance. If the same complaint is again entered against the same family, the principal adds to his request a threat to notify the city police if they refuse to comply. Such a threat has in every case been effective without the actual intervention of the police.

Some time ago Mr. Gill wanted to organize a school city in a certain large school near New York City. Although completely in sympathy with the idea, the principal withheld his consent because, as he explained, the worst boy in his school was unfortunately the most popular, and would hence undoubtedly be elected as the head of a school city. Mr. Gill finally secured his permission, however, to a provisional organization. Accordingly the elections were held, and the "bad boy" was not only not elected to the chief office, but was not even nominated for any office whatsoever. Substantially the best pupils in the school were elected, and the provisional government became permanent through the consent of the principal. The "bad boy," however, did not take seriously the "sacred responsibilities" of citizenship, and began to furnish his schoolmates in office some of the trouble with which he had always so liberally provided his teachers. After a month or two, however, the mayor and a committee of the city council requested the appointment of this very boy as chief of police.

Mr. Gill organized the first school city in a vacation school in New York City in the summer of 1897, and as a result of the success there achieved, and in a few subsequent experiments, he was at the close of the war with Spain made the General Supervisor of Moral and Civic Training in the public schools of the Island of Cuba. Judging from the official reports in the War Department, Mr. Gill's work in organizing school cities throughout the island was one of the largest factors in bringing the schools up to the relatively high plane in which we left them when we turned them over to the Cuban Republic.

Since returning from Cuba, Mr. Gill has been organizing school cities in various parts of this country. He is the president of the Patriotic League, an organization formed primarily to give moral support to the cause of civic education. President Roosevelt, Dr. Edward Everett Hale, Jacob Riis, Gifford Pinchot, and many other able, distinguished, and patriotic men are now on his board. Mr. Gill, in financing this work practically alone, has been reduced from the luxury of wealth to the pinch of poverty. To devote his whole time to the work, he gave up a lucrative employment, and it is safe to say that there is not in the country today another man who is working for the common good at greater personal sacrifice. Now that the movement has grown to national scope, now that it has been tried in the balance and has not been found wanting, and considering, too, that Mr. Gill is obviously unable further to finance it alone, is it not time that public-spirited men came to the rescue?

When we realize that our corrupt and boss-ridden cities are the feature of our democracy which has proved most nearly a failure, when we realize the magnitude of the problem of making American citizens out of the untrained hordes of alien children who are being poured in upon us by the hundreds of thousands annually, and when we realize that the irrevocable failure of any aspect of our democracy might lead to the fall of the whole structure, can we as Americans allow one man longer to fight almost single-handed a battle the outcome of which is of such vital concern to our entire republic?—The Circle for January.

THE COUNTRY'S ABILITY TO MEET A PANIC.

The strong men in the financial world have a better command over the situation than they ever had in the past. They coöperate more promptly, and with greater effectiveness. In the recent disturbance the New York Clearing-House Committee, without having any legal authority for this act, compelled certain banks to turn out the speculative gamblers among their officers and put conservative men in their places. The committee did this even though those gamblers, in most cases, held a controlling interest in the banks which they directed. In 1873, 1884, 1893, and in one or two other crises, New York issued clearing-house certificates, but in the recent flurry this improvised emergency currency did its work quicker and better than ever before.

Not only did the men in charge of New York City's banks move earlier in 1907 than they did in 1893, or in any previous financial disturbance, but the assets which they had under their control were three times as great as they were in 1893. Had the savings-banks of the country taken the precaution in the previous flurries to apply the sixty days' notification rule at the outset, as they did in 1907, the runs on them which prostrated many of them would have been averted, and they would have had an opportunity to extend aid to the national banks.

Moreover, the financial chiefs who were at the front in the recent crisis were in a position to get the aid from the outside world which was denied to their forerunners. Europe charged us extortionate prices when we were compelled to buy wheat and other articles of food there in 1837 to supply the shortage of our own farms and gardens. Our Government's revenues were so far short of its expenditures in those days that President Van Buren could not always get his salary on time, although the salary then was only \$25,000. Just after the 1857 collapse, our Government bonds had about the same standing among Europe's money-changers that Haiti's have now. In the 1873 and 1893 panics, our securities of all sorts which were held in Europe were thrown back on us by the hundreds of millions of dollars.

Our vast ascendancy not only in acquired wealth, but in the resources through which new wealth can be created, enables us to command the world's coöperation in every exigency. The United States stands first in the production of many staple commodities, and beats all the rest of the world combined in the yield of mineral oil, copper, cotton, and corn.

In an age of electricity, copper is an article of prime and constantly increasing necessity, and the world will have to come to us for most of its supply. It is coming to us and it will come to us for more of it in 1908 than it got here in 1907. In a period in which cotton, as an agent of civilization, is pushing its conquering march round the globe, we are producing three-fourths of the world's cotton, and we could readily double our present output of it.

The copper, the cotton, the wheat, the oil, the corn, the meats, and the other staples which we are exporting to Europe, Asia and Africa in immense quantities these

days are creating for us the credits abroad which have been bringing to us streams of gold beyond the dreams of Midas. Those were magnificent tributes to the United States' command over the world's prizes of fortune which the Imperial Bank of Germany and the Bank of England paid us when they advanced their rates of discount two or three times recently, with the vain hope of checking the current of gold which was flowing to us.

We need a more elastic currency, and Congress is likely to give it to us. Among the men who are in charge of our great financial interests we need a greater vigilance, and a more scrupulous regard for law. We need among the people a balance and a sanity which will save them from foolish stampedes like that precipitated by the recent scare. Basically our industrial and financial system is stronger than that of any other country on the globe. The croaker and the calamity prophet have no legitimate place in the scheme of things in the United States today.—The Circle for January.

THE TEXTILE INDUSTRY IN AMERICA.

Our first and most extensive natural industry is undoubtedly food production. The iron and steel business is second, while in the third place are our textile industries. According to a recent census bulletin, the value of the output of our textile mills in 1905 was \$1,215,000,000.

This includes cotton, wool, silk and all other fiber goods, and also the product of dyeing and finishing mills. The total exceeds by a little more than \$300,000,000 the value of the output of our iron and steel industries. The reported capital invested in textile mills of all kinds is \$1,343,324,605, and employment is given to a wage-earning army averaging 739,239 in its number. In 1850 the value of our output of manufactured cotton was about \$62,000,000, as compared with \$450,000,000 in 1905. Although made from cotton, hosiery and knit goods receive a separate classification. This industry has grown from \$1,000,000 in 1850 to \$136,650,000 in 1905. Our silk business rivals in its development the hosiery and knit goods. It has grown from \$1,800,000 in 1850 to \$133,300,000 in 1905. Our woolen business has increased from \$48,600,000 in 1850 to \$380,900,000 in 1905. Our flax, hemp and jute business was not separately reported until 1890, when its products were valued at \$37,300,000. It reached nearly \$63,000,000 in 1905.

Some interesting facts are brought out by the report of the division of wage earners in comparison with the division twenty-five years ago (census of 1880).

In the total of all employees the number of men has increased from 41.5 per cent to 45.3, the number of women from 44.2 to 44.7 per cent, while the number of children under sixteen years of age has decreased from 14.3 per cent to ten per cent. Taking the matter of child labor in the cotton-goods business by itself, it appears that in New England six per cent of the operators are children. This is a decrease from 14.1 per cent in 1880. In the Middle States 8.7 per cent are children, a decrease from the 21.4 per cent of 1880. In the Southern states 22.9 per cent are children, a decrease from the 25.1 per cent of 1880. With the exception of the figures from the South, this is gratifying, but it is a little shocking to realize that more than one-fifth of all the cotton-mill employees in that region are children under sixteen years of age. Out of a total child army of 40,000 in that line of business, 27,571 are in the South and 9,385 are in New England.

In point of number of child employees there has been actual increase in cotton mills, hosiery and knit-goods mills and in silk mills, and decrease in woolen mills and dyeing and finishing houses during the last twenty-five years. In dividing the value of products, the cost of materials is given as \$745,783,000, wages paid \$249,357,000, and salaries \$32,496,000. The money paid for raw materials represents employment for another and an even greater army of workers in an indefinite number of departments. The capital invested, which shows an increase of \$300,000,000 from 1900 to 1905, and nearly \$600,000,000 between 1890 and 1905, represents the employment of other armies in the erection of buildings and the making of machinery. The result of these combined energies was in 1905, the manufacture of 5,000,000,000 square yards of cotton cloth, 509,000,000 square yards of woolen and worsted, 82,670,000 square yards of carpets and rugs and 136,447,000 yards of silk, single width.

THE TOLL OF THE TOURIST.

The business of entertaining the foreigner and of showing him the sights has become a leading one in several countries. If Ireland is sustained by the summer tourists, so, in much larger proportion, are Switzerland, France, and Italy. It will probably surprise most persons to know that the annual income of France from tourists is something like \$500,000,000. Paris bankers have even placed the figure as high as \$600,000,000. This is \$16 per capita compared with a per capita export of domestic products of \$25. The Swiss are said to be "a nation of inn-keepers," and any one who has traveled about in the twenty-two cantons knows how the people of that republic cater to foreign visitors. But very few realize that the income from pleasure seekers in the Swiss mountains and valleys is greater than that from Swiss exports of merchandise or from farm products. Italy has lately been forced to admit, through some of her economists, that the gold of the transient population is a source of profit ranking well up with that of industry and commerce, and, further, that the northern part of the kingdom derives much compensation from the liberal tourist and collector. The tourist toll to Italy is now reckoned at \$100,000,000 a year, or nearly equal to the value of exports from January to May. Wealthy old John Bull does not ignore the rising stream of gold that flows into his vaults from the pocketbooks of the foreigner and acknowledges that his favorable trade balance with the United States, from June, until October, is primarily due to the bills that the American tourist contracts while abroad. Egypt, Norway, and Holland, as well as Germany, draw freely on the balances of the sightseer, though it will be readily admitted that the English, the Germans, and the Dutch give back in the pursuit of their own pleasures more than they receive from those of others.—Review of Reviews.

BONAPARTE DISCUSSES PUNISHMENT.

One of the gravest questions that sociologists have to deal with and theorize about is that of the punishment of criminals. A great many theories have arisen, but practical progress along the line of punishing and at the same time bettering the criminal has not been very rapid. Attorney-General Bonaparte discussed the subject before the national prison congress at Chicago and took the view that reform is the proper end of punishment.

"The primary purpose of punishment," said he, "is to assure obedience to the law; when inflicting punishment the state looks not to the past but, to the future; not to the individual who has disobeyed and now suffers, but to all the individuals in like case with him who may hereafter fear to disobey by reason of his suffering. The welfare of society depends not on what happens to those convicted of crime, but on what happens as the result of their conviction and chastisement to its innocent members; the efficiency of any form of punishment, the merits of any accepted principle or method of our criminal law, must be judged by its results to the community at large; if it diminishes crime and makes obedience to the law more prompt and general, then it is a good thing; its effects on the law-breakers, while worthy of note, are of vastly less moment.

"If any form of punishment renders those who have suffered it less willing or less able to again break the law, it is a good form of punishment; if it makes less neither their readiness nor their capacity to do again the like wrong when occasion offers, then, in so far as it affects them, it is a failure. I would not have men hanged today for a trifling theft, but I would have modern society cease to nourish and shelter its proved and inveterate enemies." The power of the executive to pardon he thought was a good one where it is exercised for the public benefit; "the wishes and interests of the culprit or of his family or of his friends are altogether immaterial, except in so far as these individuals may constitute an infinitesimal fraction of the public affected. If I were conscious that I had ever advised the president to exercise clemency for no better reason than because I felt sorry for the prisoner or those interested in him, I should feel that my conduct had differed, indeed, in degree, but not in kind, from what it would have been had I given such advice for a bribe in money."

Echoes from Everywhere

FOREIGN.

The Japanese government has agreed to issue no more passports to this country for Japanese laborers. If this generous act is carried out it will remove all the friction between the two countries for the present.

Viscounti Aoki, the Japanese Ambassador to the United States, attempted to adjust this question, but his attitude was so unreasonable that it was impossible to make any progress. It is significant that within three days after his departure that the two governments reached an agreement on a question which has caused much friction and for a time threatened to bring about war between the two nations because of the agitation and bitter feeling engendered by the discussion of this subject.

This exclusion act does not bar the better citizens of Japan from coming here, but only the questionable grades who do better at home.

The discovery of three "high places" or sanctuaries near Jerusalem is described in the January issue of the Biblical World by Professor George L. Robinson of the McCormick Theological Seminary.

Professor Robinson discovered the Khubtha high place, the Deir high place, and the Khirbet high place. All three of these temples are situated on practically unscalable rock promontories, 3,700 feet in altitude and in the wildest imaginary country. The temples are so constructed in every case as to be entirely secluded from the surrounding high ground.

Chambers are hewn in the rock, and there is every evidence that the altars were used for human sacrifices.

If the auctioneer's description is to be relied on, the flag of the American man-of-war Chesapeake is to be sold at auction in London at the end of this month. The Chesapeake, commanded by Captain James Lawrence, was captured by the British ship, Shannon, in the war of 1812. Lawrence was the man, who, with his breath, cried, "Don't give up the ship!"

The new King of Sweden has been described as a lover of court ceremony, quite different from his democratically inclined father, but his acts would indicate the contrary. He has ordered the abolition of the coronation ceremonies, and has announced that he will do away with the pompous, medieval ceremonies with which the Swedish Parliament has opened in the past. The Swedes hail the changes as fitting for a modern and progressive nation.

Little things serve to show how China is changing. One of our consuls there reports that Chinese farmers in the province of Spautung about I-chow-Fu, are beginning to raise white potatoes, and that the foreign dairy there now sells more milk to natives than to foreigners. In the past, the Chinese have used very little fresh milk. Condensed milk has become popular, and is now being used to a considerable extent throughout the Empire.

The second trial of Maximilian Harden, the editor of the German paper, "Die Zukunft," for libeling Kuno von Moltke ended in his conviction and sentenced to four months imprisonment. Harden's revelation led to the destruction of the influence of the Round Table over the Emperor. In his first trial, he was acquitted. The second trial seems to have been conducted rather for the purpose of rehabilitating the army than for any other purpose. The evidence in the second trial showed that von Moltke's former wife was not a reliable woman according to the testimony of her divorced husband. It was principally on her statement that Harden had relied for his implications that von Moltke was abnormal. Whether Harden is formally adjudged guilty or not, he has succeeded in his declared object of destroying the secret influences about the Kaiser.

At the annual meeting of the Peninsula and Oriental Steam Navigation company Sir Thomas Sutherland, chairman of the company, made the confession that the entire trade of the line between Bombay and Japan had been wiped out by its Japanese competitors. He blamed the Japanese government for too much activity in despoiling England of trade.

A recent enterprise for securing evangelists for the extensive prairie land in Western Canada, is that of Archdeacon George Lloyd, who first entered the Saskatchewan country in 1903, at the time when immigration into Canada began. Since that time railways have helped to open the country, and more than thirty missions have been established. About a year ago Archdeacon Lloyd returned to England to secure a band of prairie evangelists, and has now returned to his field with a numerous band of men to serve as catechists, each in charge of from one to two hundred square miles of territory, where they are to open centers of worship. Five ladies have also volunteered as deaconesses for work with women and children.

NATIONAL.

President Roosevelt is meeting legal opposition as regards his dismissal of a company of colored soldiers without honor for shooting up the town of Brownsville last year. Mr. Reid, one of the discharged soldiers, has made a test case of the matter and some leading men at Washington are backing him in the case. We await the outcome with anxiety because this is only one of many charges of usurping authority made against the President. We predict that evidence will justify Mr. Roosevelt just as it has in test cases in the past.

The Government has decided to rush work on the Philippine defenses. The War Department will probably ask Congress for a special appropriation so that the Philippines can be made impregnable to invasion by possible foes.

SCIENTIFIC.

The six special tuberculosis dispensaries opened by the Chicago Tuberculosis Institute three weeks ago are finding plenty to do. One hundred and forty-eight patients have already presented themselves for treatment.

It is a daily experience for the institute's nurses to find patients living with their families and entirely ignorant of the simple means of preventing infection. In practically every instance the nurses have quickly introduced a manner of living that will be safer for the family.

The dispensaries are already disclosing the need of more hospital facilities for the very sick and open air sanitariums for the early cases.

Philadelphia is ridding herself of impure water in a new way. The plan is to pass the water through stand-pipes and at their base to introduce air, which, by an electric process, will have the oxygen changed to ozone. The introduction of this ozonated air renders the water pure and clear. That the plan is effective is shown from the fact that in twenty drops of Schuylkill River water there are 2,500,000 bacteria, while after it has been ozonated there are only twenty-five; or, in other words, only one in a hundred thousand, are left. The plan is practical as to cost and supply. The cost for cleansing a million gallons is on \$3.50 and the plan is capable of purifying 75,000,000 gallons a day.

The practical limit of deep-sea diving, under the best condition, is placed by Hill and Greenwood, of the London Hospital, at thirty-five to forty fathoms. A special study of eight years has shown these physiologists, that the chief danger to the diver arises from the nitrogen absorbed by the blood and other body fluids, and that it is the absorbed nitrogen that produces the ill effects of rising too quickly. The breathlessness and oppression felt by the working diver are results of poisoning by carbonic acid instead of direct effects of the great pressure. With special air pumps and extra precautions, the experimenters descended thirty-five fathoms in a Scotch loch, and, rising very slowly, were none the worse for the experience, but the oxygen required for regular working at such depth is so great in amount that pneumonia and convulsions are commonly produced.

Gold formerly held a leading place among medicines, but even the much-vaunted cure for alcoholism by chloride of gold seems to be regarded as without therapeutic effect by most medical men now. Dr. A. Mandet, however, records that salts of gold are still used in the regular practice of a few French physicians. Chronic rheumatism is treated by Professor Gasset with chloride of gold and sodium, which in dilute solution is injected by Dr. Blue, into tuberculous tumors; for epilepsy Professor Lemoine gives bromide of gold, the remedy of Professor Robin for cancer; and a hypodermic injection of chloride of gold solution is Dr. Calmette's cure for viper bite.

CHURCH AND REFORM.

That the Bishop of Albany should have declared fearlessly and without absolute loyalty to Catholic tradition, that the bishops were at liberty to invite and authorize men who were not ordained in accordance with the church's law to give a message from God to their people; that in addition to this he should claim the right, with entire obedience even to the letter of the church law, to receive at the Holy Communion unconfirmed

Christians, who could not, therefore, be formally admitted and counted as communicants; all these things combine to show that a new era has begun within the Catholic church.

"The Every Day church" is what the Rev. A. Eugene Bartlett, pastor of the Universalist Church of the Redeemer, Warren Avenue and Robey Street, plans to institute during the present year. A school of domestic science will begin activities later in the month. The social life of the congregation and the neighborhood are to be ministered to by a dramatic and choral society.

"We shall aim to make our church a community center," said Mr. Bartlett in the course of his sermon. "The church will have an office and relief bureau that will be open during stated hours every weekday. It will, in coöperation with the other charities already organized, endeavor to assist scientifically the distressed and suffering men, women, and little ones in the community. It will also maintain a free legal bureau and a branch of the penny stamp savings society.

"January 23 we will open a school of domestic science for working girls. The church will conduct the flower mission work, and will have a literary society, dramatic club, and a choral society. Neighborhood socials, public health lectures, and many other departments of work will be instituted. During the summer it will maintain fresh air and outing work, and establish a free drinking fountain.

"In these and many other ways the church will seek to aid the community in creating saner, healthier, and happier lives for all its members, whether they belong to one church or another, or no church at all."

Temperance leaders claim that 40,000,000 people in the United States are living in anti-saloon territory where whisky can be had only by violation of statute. Science and business have knocked whisky out after morals and religion failed, yet religion will wear the laurels because religion proves itself to be the true foundation for business and science.

The Standard Oil Company's foreign business has grown so that the company is planning a great new refinery on the Jersey coast, opposite Staten Island. The first section alone, which will be completed next July, will employ 1,200 men, and will be able to refine 20,000 barrels daily. In time the new plant will be made the largest of the Standard Oil refineries. To take care of the increase in foreign trade the company expects to get a hundred or more new tank steamships in addition to its present fleet of seventy-two tank and twenty-two cargo steamships. The company at present employs 71,000 men.

WANT AND EXCHANGE

To accommodate some of our readers and bring them in closer touch with each other, we have opened this "want and exchange" column.

Rates, twenty-five cents per insertion, not exceeding four lines, including name and address. Five cents per line for additional lines. However, no "want" may exceed six lines altogether.

For only \$1,000 I will sell my beautiful home, three miles from Chambersburg, not far from State Road, in the beautiful Cumberland Valley; large and good buildings on 106 perches of ground.—D. Hostetler, Chambersburg, Pa.

NEFF'S CORNER

A TESTIMONIAL.

Morrill, Kans., Nov. 20, 1907.

To Whom It May Concern:—

This is to certify that I made an investment in the J. M. Neff Investment Association of New Mexico, that when I had occasion to use the money in my business and called for it, it was promptly returned to me, and that I received interest on it from the time of investment to the time of the last semi-annual dividend before withdrawal at the rate of 15 per cent, per annum. It is needless to say that I am entirely satisfied with the transaction and can cheerfully recommend the investment plan offered by Mr. Neff to any who have funds to place.

Respectfully, B. A. NOFZIGER.

For full particulars about the above plan of investment, address,

JAMES M. NEFF, Clovis, N. M.

PROBLEMS of PULPIT and PLATFORM

By D. D. Culler

In this book the author discusses some of the most important problems of public speaking. A few of the subjects discussed are:

Forecast for Public Speaking.
The Speaker as Blood and Brawn.
The Voice in Public Speaking.
The Audience.
The Discourse.
Style in Discourse, etc., etc.

The book will be found very helpful to all public speakers or any one interested in this line of work.

Just Published!

"RAYS OF THOUGHT"

By Josie Dayton Curtiss

This late work is the thought of mature years placed in poetry. The book contains about 50 poems on various subjects.

A few of the titles are:—

- "A Study from Nature."
- "Cause and Effect."
- "Grandfather's Place."
- "Our Ideal Home."
- "Storms of the Soul."
- "The Judgment."

"Rays of Thought" Appreciated

The first unexpected words of appreciation for "Rays of Thought" were voiced from the pulpit by Mrs. Curtiss' own pastor, Rev. Wesley M. Embree, soon after it appeared from the press of the Brethren Publishing House.

From a numerous collection of kind words from many people regarding the volume we select the following: Ex-Prof. Hyslop, Columbia University, New York, says: "A glance at the contents shows me I wish to read it all." Elbert Hubbard says: "'Rays of Thought' shows a deep insight into things." Prof. Mangold, University, Pa., "Expresses a wish to hear more from the writer upon a specified topic." Luther Burbank, California, is especially kind and commendatory regarding thoughts on page 139.—Republican News, Maringo, Ill.

The book is well bound in cloth and gold stamped. Size 5¼x7¾ inches.

Price prepaid,\$1.00

A copy of the "Ideal Nurse," a 16 page folder with cover, free with each book.

BRETHREN PUBLISHING HOUSE,
Elgin, Ill.

HIS LIFE

A complete story of the Life of Christ in the words of the Four Gospels, using the text of the American Standard Revised Bible.

In this book we have a complete harmony of the Gospels in a single narrative, giving what each of the four gospel writers has recorded in chronological order.

SUNDAY SCHOOL SCHOLARS

will do well to secure a copy to be used during the first six months of 1908, since our lessons will be on the Life of Christ.

Price, paper bound, each, ...	15 cents
Price per dozen, prepaid,	\$1.50
Cloth, per copy,	25 cents

BRETHREN PUB. HOUSE,
Elgin, Illinois.

Bird's Eye View of the Ministry of Christ

Arranged by A. W. Vaniman

The most unique and simple harmony of the gospels yet published. All the most important events of the life of Christ are arranged chronologically and references are given for each.

PLACE ONE IN YOUR BIBLE

Get a dozen copies, place one in your Bible and hand the rest to eleven of your friends. They will appreciate the gift and the one copy you use yourself will be worth many times what the dozen will cost you during the next six months in the study of the Sunday-school lessons.

Price, per dozen copies,15 cents

BRETHREN PUB. HOUSE,
Elgin, Illinois.

LOMITA, CALIFORNIA

1. Situated four miles from the ocean, and near San Pedro Harbor. Rich soil, excellent natural drainage. Can grow crops 12 months in the year.

2. Three wells of soft water for irrigation and domestic purposes. Water piped to each one's land. Settlers to own all water systems.

3. Natural gas comes up with water, and is used in engine to pump the water, making the expense of lifting quite nominal. Gas leaves the water on reaching the air, hence pure water.

4. Markets at the front door and back door; land and water transportation to all the world.

5. Grain and corn raised without irrigation. Crops from October to May, barley, oats, wheat, onions, cabbage, beets, peas, cauliflower, radishes, citrus and deciduous fruits, nuts, and vegetables in their seasons. Government analysis of soils shows much of this land very fine for oranges and lemons.

6. Six lots donated for German Baptist Brethren church. Good opening for business. No saloons, no pool rooms can be operated on these lands.

7. All kinds of produce bring good prices, at San Pedro Harbor and Los Angeles. Profits from \$100. to \$500 per acre per year. Settlers arriving right along. This colony sure of success, as it has the soil, the water, markets, the push and a twelve months' climate to grow useful things.

Olive Branch of Peace

Valuable Contribution.

Dear Brother Hays: I have ordered a copy of your book, "The Olive Branch," and have read it with exceeding interest. It is a valuable piece of contribution, not only to the history of the Valley of Virginia, but also to the history of the Brethren Church and other peace loving societies of God's people. Especially is it valuable as a clear and full statement to the world of what the world is coming more and more to recognize as just, reasonable, and desirable—Peace, and the spirit of Christian peace. I pray and believe that by means of this book, "The fruit of righteousness is sown in peace of them that make peace."

Yours fraternally,

John W. Wayland.

University of Virginia, Charlottesville, Va., Oct. 29, 1907.

This book contains 232 pages, has a number of illustrations and is well bound in cloth.

Price prepaid,75 cents

ALBERTA

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the Brethren already there and enjoy some of the material benefits as well as help build up one of the largest Brethren Colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

BUTTE VALLEY CALIFORNIA

and

ROGUE RIVER VALLEY OREGON

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

Take the

Union Pacific Railroad

Daily Tourist Car Line

BETWEEN

Chicago, Missouri River, Colorado,
Idaho, Oregon, Washington and
California Points.

TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

Be sure to buy your ticket over

The Union Pacific Railroad

known as the Overland Route, and is the only direct line from Chicago and the Missouri River to all principal points West. Business men and others can save many hours via this line.

**THERE ARE
FIVE WAYS
TO INVEST
MONEY**

WHICH IS BEST?

**KEEP YOUR FINGER
ON THAT ONE, BOY
—YOUR EYE TOO!**

☞ It is the best of all the five.

☞ Real estate is always the best investment.

☞ It does not burn up nor run away.

☞ You can enhance the value of your own property.

☞ Real estate raises a living even in a panic.

☞ Make up your mind to own a good home, and act NOW.

The Next Question Is, **WHERE?**

The Answer is Just as Easy, and Just as Safe. Here It Is.

IN **BUTTE VALLEY, CALIFORNIA**

Why?

1. It has a salubrious climate.
2. It has the richest of soil.
3. It has an abundance of pure water.
4. It has a new railroad, in building, through the middle of it.
5. It has an inexhaustible supply of timber.
6. It is a level valley of 4000 ft. altitude.
7. It is good for diversified farming.
8. It is superb for dairying.
9. It is unexcelled for stock-raising.
10. It is unrivalled for fruit-growing.
11. It cannot be beaten for poultry.
12. It is in the greatest hop county on the coast.
13. It has a good town started, on the railroad.
14. It has a church and a school.
15. It has two saw-mills in operation.
16. It has produced a splendid first crop this year.
17. It requires no irrigation.
18. It furnishes good hunting and fishing.
19. It has short, pleasant winters.
20. It has the qualities of an ideal home.

A Word to Hard-Working Men and Women

If you are one of those, who, like most of us, must toil for a living and this constant toil is beginning to tell on you; if as a result, you feel stiff and sore, with aches here and pains there; touches of rheumatism, stomach trouble, dizziness and other symptoms, **Dr. Peter's Blood Vitalizer** is the very medicine your system needs. This old time-tried herb-remedy will set you right, purify and enrich the blood and strengthen your entire system.

It is a medicine that is prepared from pure health-giving roots and herbs. For over one hundred years, it has been a boon to ailing men and women. It had its birth in those early days when rugged honesty was the rule, rather than the exception and has been handed down unchanged as a heritage from generation to generation.

Men and women in all walks of life have testified to its merits.

A MOTHER'S LETTER.

Pine River, Minn., June 28, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—I thank you for the time I have acted as agent for your medicines. You have always treated me kindly and fairly. Your **Blood Vitalizer** cured our little five-year-old boy of the jaundice. He was in a bad condition. I weighed him before commencing treatment. He took one bottle of the **Blood Vitalizer** and in two weeks he gained three pounds. He is now as well and healthy as any boy can be.

I would not think of being without your **Blood Vitalizer** and **Oleum** in the house.

Yours truly,

Mrs. I. E. Norman.

SOUND AS A DOLLAR.

Americus, Ga., July 12, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—I thought I would write you a few lines and tell you that of the box of **Blood Vitalizer** I ordered from you I kept three bottles myself. Last fall I was very sick with malaria. The doctor treated me without results. I decided to try the **Blood Vitalizer**. When I had taken it two days I was able to get out of bed. I took one whole bottle, and I have been as sound as a dollar ever since. We never expect to be without your medicine in the house.

Yours truly,

Frank Anderson.

CURED EIGHTEEN YEARS AGO.

Hespeler, Ont., July 23, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—About eighteen years ago your medicine cured me of a chronic stomach trouble with which I had suffered for two years and which the doctors had failed to cure or even help. I bought the medicine of your agent. I began taking it and obtained relief at once. It finally cured me, and I have been well ever since. There is no one here at this place, as far as I know, handling the **Blood Vitalizer**, so please send me agent's terms and full particulars.

Yours truly,

Box 205.

J. N. Cobe.

NONE BETTER.

Mirabile, Mo., June 29, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Gentlemen:—I am convinced by experience that there is no better medicine in existence than the **Blood Vitalizer**. I wish I could make the people of this town learn, as I did, what it can do. I am trying to get an agent for you here. I shall soon need another supply of the **Blood Vitalizer**, as it is the only medicine that does me any good when sick or ailing.

Thanking you for past favors, I remain,

Yours sincerely,

Mrs. G. W. Grant.

Such is the testimony of those most competent to speak, the users of the medicine. Don't ask at the drugstore for the **Blood Vitalizer**. It is supplied direct from the laboratory to sick people everywhere.

DR. PETER FAHRNEY & SONS CO.,

112-118 South Hoyne Avenue, CHICAGO, ILL.

RAISIN CITY COLONY

Owned and Controlled by BRETHREN

Twelve ministers have purchased land at **RAISIN CITY**. Regular services are held every Sunday.

POSTOFFICE

is now established with A. W. Vaniman Postmaster. The Hotel is now completed and doing a prosperous business. Rasin City Lumber Company has a large stock of Lumber and is doing a flourishing business.

RAISIN CITY is located on the Southern Pacific Railroad, 14 miles from Fresno, a city of 25,000.

DAIRYING AND STOCK RAISING.

This land is especially adapted to dairying and stock raising as it is the home of the alfalfa.

(Continued from last week.)

Irrigation.—This is one of the things very little understood by our eastern friends. Here in our Valley, the water is taken out of the Wenatchee River, 17 miles above Wenatchee, by means of a large canal, which is dug in the side of the mountain, and carried across canyons and steep places in board flumes, and in some places tunneled through solid rock. The water is taken from the main canal in smaller ditches and conveyed to the land, where it is run over the land in small ditches, usually made by placing one large shovel on the cultivator. The water is turned into these small ditches and we follow up with a hoe and see that it passes to the end. The land is first leveled so the water can pass over it.

Timber.—We are at the foot of the Cascade Mountains, where timber in abundance for all purposes can be had. The nearest sawmill to Wenatchee is 13 miles out.

Lumber.—Prices of lumber and fuel have doubled here in the past three years, caused by the well organized trusts and combines, the high price of labor and transportation. Prices range from \$16 to \$40; dimension stuff, \$20 to \$22 per M.; flooring and siding, \$30 to \$35. Prices have dropped recently, so by buying a bill you can get much lower prices.

Fuel.—Fuel, like lumber, is much higher than it should be for the same reason. In carload lots, about \$4.50 per cord. Coal ranges from \$5 to \$10 per ton. If you have river front and will take the time during high water (which usually lasts about two months) you can get all the drift wood you want for the picking up. Some men have gathered enough in one day to last them one year. I have seen as high as five saw logs floating at one time. I have 80 rods river front, and last season procured enough wood to run one family six years.

Markets.—Our market for our principal crop is the world. Our fruit is shipped all over the world. Last season a farmer here loaded six carloads of apples which he shipped into Australia. He accompanied the shipment, taking with him his wife, daughter and son-in-law, and made a net profit (after paying all expenses) of \$1.75 per box of 48 lbs. This season he received another much larger order, also one from Berlin, Germany. We have the Coast cities to the west, where population is increasing at a very rapid rate and where the lumber industries, and mining industries, the great ocean steamers, all have to be supplied. Then, again, we have Spokane to the east, a distance of only 175 miles. Then we have the great northwest, from Chicago to central Washington, where little fruit is raised. Take the Dakotas, Minnesota, Wisconsin, Montana, and the Canadian northwest and they will always depend on buying their fruit.

Overproduction.—We are often asked if we do not fear overproduction. On account (in part) of the above statement, we usually say no, but we believe that in certain varieties of our products low prices will prevail, but taking all things into consideration we feel that our commodities are the least liable of all other in the United States to be overdone. The supply for first class winter apples (such as we raise) has never been equal to the demand, and it looks very reasonable that it never will. In the poorer grades there will be times when the market will be glutted and losses will be sustained by overproduction. But while that be true, the east and south are continually meeting with crop failures. This always means an advance in price to us, which overbalances what we lose when the world's crop is large. Then again, every fruit growing district is supplied with evaporating and canning plants that can always pay profitable prices for these fruits to can and dry them. Then again, when you take into consideration the fact that when the world's crop is light, like the past season, and you realize from \$300 to \$3,000 per acre, you can stand a little overproduction at times.

(To be Continued.)

Possibilities of IDAHO

Unlimited

Many Brethren are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for Brethren and others of small means to get good comfortable homes with a splendid income.

Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

Realize \$1,000.00 Per Acre

Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

HOMESEEKERS' ROUND TRIP TICKETS

Will be in effect in the Spring of 1908

Colonists' one-way rates in effect from March

1, to April 30, 1908

Chicago's Business Record for 1907

SOME country people think that city life is a life of ease, but the following figures will show that much hard labor and heavy responsibility rested upon a large part of Chicago's population or else this great volume of business could not have been done in one single year.

In the following tables only a few of the many occupations have been named.

Wholesale Business.

Steel,	\$ 63,000,000
Jewelry,	53,000,000
Leather,	26,000,000
Liquor,	61,000,000
Lumber,	83,000,000
Mail-order houses,	90,000,000
Paper,	26,400,000
Produce markets,	195,000,000
Tobacco,	12,650,000
Dry-goods,	256,800,000

Hardware, groceries, clothing, cigars, and carriages, each represent over \$10,000,000, some of them over \$100,000,000.

The total wholesale business foots up \$1,599,132-000.

Manufactured Articles.

Electrical appliances,	\$ 22,400,000
Farm implements,	86,400,000
Foundry products,	72,040,000
Furniture,	25,300,000
Steel products,	66,000,000
Leather goods,	21,735,000
Publications,	33,500,000
Meat business,	400,000,000
Miscellaneous products,	219,000,000
Clothing,	77,000,000

The above represent only those lines of goods whose output was over \$20,000,000. The total output of all handicraft was \$1,370,000,000.

Bank Clearings.

CHICAGO bank clearings show an increase of \$1,040,335,976 in 1907 over the clearings during 1906. The year just ended shows Chicago bank clearings as \$12,087,647,870, while 1906 figures reached \$11,047,311,894.

The following table shows the amount of business done by the banks in various cities of the country for 1907 as compared with those of 1906:

	1907	1906
Chicago,	\$ 12,087,647,870	\$ 11,047,311,894

New York,	87,000,000,000	104,675,828,656
Boston,	8,135,210,165	8,335,346,113
Philadelphia,	7,161,060,440	7,486,966,980
St. Louis,	3,165,619,327	2,972,653,307
Pittsburg,	2,743,570,483	2,640,850,045
Baltimore,	1,472,911,207	1,444,850,075
Cincinnati,	1,361,879,950	1,310,435,600
New Orleans,	956,338,295	1,020,252,303
Kansas City,	1,649,175,013	1,341,675,055
Detroit,	711,010,404	670,130,697
Indianapolis,	399,269,144	336,054,538
Omaha,	567,515,788	504,388,765
Memphis,	248,871,040	247,534,435
Denver,	409,796,538	349,774,100
Cleveland,	497,170,783	837,548,334
Louisville,	645,285,614	649,847,716

Live Stock Traffic.

THE following tables show the receipts and shipments of live stock sold on the Chicago market during the year 1907:

	Receipts.	Shipments.
Cattle,	3,305,314	1,452,074
Calves,	421,934	24,837
Hogs,	7,714,061	1,711,902
Sheep,	4,218,115	1,148,724
Horses,	102,055	85,534
Total,	15,761,479	4,423,071

Car loads,	295,081	97,868
		Value, 1907.
Cattle,		\$173,326,800
Calves,		4,424,700
Hogs,		110,256,300
Sheep,		21,735,800
Horses,		16,797,000

Total, \$326,540,600

Lake Receipts and Shipments as Reported by Collector of Customs Ames.

THE annual report of John C. Ames, collector of customs for the port of Chicago, shows an increase of tonnage entering and leaving Chicago's two river harbors over 1906. Large increases in receipts of coal and iron ore and in shipments of corn and wheat are recorded. Collector Ames gives the following for 1907:

Commodities.	Receipts.	Quantity.
Coal, hard, tons		1,093,958
Coal, soft, tons		414,534
Salt, tons		220,601
Iron ore, tons		4,859,312
Cement, tons		59,315
Lumber, 1,000 feet		409,683
Shingles, 1,000		27,075
Lath, 1,000		8,043
Posts, pieces		1,272,250

a preoccupied, nearsighted manner up the tree trunk. Having finally reached the top of his spiral stair-case, one might suppose that he would rest long enough to survey his surroundings, but like a bit of loosened bark he drops off to the base of the nearest tree and resumes his never-ending task."

The brown creeper's note is a contented chirp, ut-

tered as if he were not aware of the fact. He is one of the few winter birds that do not congregate in flocks; and the one you see may be the only one within a large radius. One needs to keep a sharp lookout to see him at all, so closely does he resemble the bark of the tree up which he is hitching.

The nests of these odd birds are made of twigs, moss and bark, placed behind bits of loose bark on dead trees or stumps, but a short distance above the ground.

The white-breasted nuthatch plays the acrobat as bravely in January as in June. His loud, nasal "yank, yank, yank" that one hears so often on these still, biting January mornings when the sun makes no

impression on the snow, warms many a bird lover's heart.

These birds seem to be the very opposite of the brown creeper, in that they flit among the branches of the trees and hunt over the tree trunks downward, head first. As may be inferred from his name the breast is white, the back gray, and the male wears a bluish black crown.

I have found these birds interesting from an economic standpoint. Day after day, they go over the same trees, the chickadees and kinglets rapidly, and the downys and creepers and the nuthatches with great care; yet they never exhaust the supply of food. Now when we consider the number of insects and larvae which such a group of from a dozen to fifteen birds destroys during a winter, we can realize something of the value of the smallest birds.

One of the bulletins of the Ohio Agricultural Experiment station says: "If feeding of winter birds were more generally practiced, they might soon become sufficiently abundant to supply all the orchards in the state." It further recommends the feeding of the winter birds as one of the best methods of winter entomological work.

Spiceland, Ind.

SCHOOL is not simply a preparation, but it is life itself. It is life, pure and simple; and every time we fail in performing a single duty, we have lost in the great race of life.

In school you may be led, or you may be driven. In Palestine they lead the sheep, but drive the goats. It is necessary to have some one to drive the goats; but if you have the care of sheep, it is simply enough to give them the call. You can soon tell which you are yourself. Examine yourself closely and ask yourself, "Am I a billy-goat or a sheep, easily led and easily controlled, or am I some other type of animal?"—*I. N. H. Beahm in Our College Times.*

Health, Disease and Healing

Harry B. Bradford

(Mr. Bradford has written much on this subject for leading magazines and speaks for an increasing host of health-seekers who are trying to get away from drugs and back to nature. He has been a contributor to the "Inglebrook" for several years, and at his request we give him this privilege to denounce drugs. While the indiscriminate use of drugs has been harmful, yet we may rest assured that herbs will continue as medicine for years to come. We hail the day with gladness when diet, sanitary measures and exercise will be more freely used to maintain health than what they are now.—Editor.)

DID you ever wonder how or why the wild creatures of the woods and fields possessed such perfect health and great vitality? Of the many wild animals I have ever seen or dissected, I do not remember having seen one which was sickly or diseased!

How wonderfully active is the plump, bright-eyed squirrel, as he scuds over the treetops, more rapidly than we could run on the ground. The "cotton-tail" shoots away like an arrow, at the sound of our footsteps; the old "buck" woodchuck's jaws snap like a steel trap as he finds his den in the old stone wall discovered.

Why are God's lower creatures so universally well and wonderfully strong, while civilized man is so often weak and diseased? The lower animals obey nature's laws; man violates them, and weakness and disease are the penalties he has to pay.

Ignorance makes slaves of people, and is the cause of very much disease. St. Paul tells us to "Prove all things; hold fast to that which is good." I am going to hold fast to that of which I am telling you, for I have proved, by experience, that it is true.

What does health mean? It means a state of physical being where every function is working perfectly, painlessly, easily and pleurably.

How many have such health as that and what conditions are necessary to have such health? Right living habits, with healthful surroundings is the answer. We should have at all times, pure air, sound sleep, abundant out-door exercise; and when hungry, sufficient, but not too much, natural, nourishing (not stimulating) food, and provide proper conditions for its thorough digestion before more is taken. Then we must keep the system clean within, and the body clean without. The blood is the cleansing fluid of the body, and when anything defiles that, the body is defiled, and when that is purified, the whole system is cleansed and made free from causes of disease. Thought precedes action, and if we learn the true way, we will walk in it, and receive the reward.

This subject of the cause and cure of disease is vital to every civilized human being. People often pay terrible penalties by paying others to think for them about what they should all know themselves. How

few seem to realize the great truth that God made all his creatures self-healing and self-regulating. Man has to repair all his broken machines; he never made a machine which could mend itself. Therefore a crab is more wonderful than the greatest battleship!

The blood is the only substance which can possibly heal the body and cure disease. It heals our cuts, bruises and broken bones; it develops us, when used by the life forces, from a single cell to birth and full maturity. It would heal all our diseases as well, were it not so often crippled and polluted by the poisons taken as medicines which ignorant man imagines can do the work better than God's way!

Did you ever hear of a miracle more wonderful than human development from cell to old age? Is it unreasonable to believe that this most wonderful fluid which the Creator put in the body, can really do what it was put there for—nourish and heal the body?

Doctors and laymen have sought for thousands of years to find some other way to "cure" disease, but they have never found it, and never will find it—until God reverses the laws of nature. There is nothing in any bottle which can prevent a man from reaping the penalty of wrong living.

Disease does not settle on any person haphazard—living habits merit it, or it would not appear. "Disease" is an effort of the human machinery to correct something wrong. If we didn't have diarrhoea and fever when there was fermenting and decaying food in the intestines, we would have death from these poisons! Nature produces the "symptoms" we call disease, in order to save our life. Remove the cause and the disease must go. Poisonous drugs only smother, benumb and change the symptom and form of disease. They never can remove the cause, and so never can, and never did "cure" disease, although nature often cures in spite of them, where the vitality is powerful enough to cast out the poisonous drugs and the poison of the disease also.

The "drug delusion" is a relic of the dark ages when ignorant, superstitious people believed disease was a "devil," and the only way to get that "devil" out of the body was to poison it out. Do you think poisons which will make a well person sick, and possibly kill him, are good things for a weak, sick person to take into his stomach (which was only made for food and water) for any purpose? Will your reason allow you to believe such folly as that?

One might as well try to destroy an ignorant person's faith in their religion as to destroy the faith many ignorant people have in the mysterious power of drugs to "cure" disease. I had just that faith in

them years ago, when I didn't know any better way. They kept me from being well for fifteen years! And now it is over twelve years since I have taken one of any description. The blood is alive; drugs are dead and deadly poisons; they produce disease in those who are well! Can a man rival the Almighty, and produce a healing fluid equal to the blood? Is "science" wiser than nature? Can "science" make an egg that will hatch?

Drugs do in the human anatomy what grit and dirt would do in the finest machinery! Do you call a person well, who has to move his bowels or digest his food with poisons? Do you think God left his creatures to the mercy and ignorant experiment of man's "science?" Medical science, by drug medication, has slain millions; has produced millions of hopeless invalids and cripples; has produced the worst diseases known to science, in the innocent, and has enormously increased disease! I know this to be a fact. I know many people who have been crippled for life by calomel, and other deadly poisons, regularly given by "regular" members of the medical profession!

Patent medicines contain morphine, cocaine, opium and alcohol—all deadly poisons! They have been a curse to the ignorant—ruined their health and drained their pocketbooks—for a set of scoundrels who love money more than honesty, and who can feast off the blood of the poor and ignorant!!

All poisons weaken the system if they do not kill outright, and the system being weakened calls for more of the false stimulant which fattens the purse of the manufacturers!

Dr. Wm. Osler, a leading physician in America, recently said: "He is the best physician who knows the worthlessness of medicine." Sir Frederick Freves, England's greatest physician and surgeon said that "physicians are relying less and less every year on medicines, and more and more on pure air, diet, exercise and other natural means to cure disease." Dr. Eli P. Miller, one of the oldest and most reputable physicians in New York City, who has practiced the healing art for nearly half a century, wrote this: "Those who are treating the sick by diet, electricity, vibration, hydrotherapy, are curing more in proportion to the number they treat, than the drug doctors. All drugs are more or less poisonous and many of them deadly poisons. My experience has convinced me that more people die from the effects of the drugs given them, than from natural causes, or, than would die without any drug treatment at all if they had received proper advice about food and hygiene."

Sir J. Campbell Morgan, a great English preacher, said he would take his physician's advice about hygiene, but not his medicine. Dr. Pentecost, one of England's greatest clergymen, adopted Dr. Edward H. Dewey's theories, and recovered great health and strength without drugs of any kind, and he later wrote

a preface to Dr. Dewey's book entitled, "The True Science of Living; or The New Gospel of Health."

To return to the subject of drugs again, I wish to say that plants are made to feed on chemicals, while the human system can't use crude chemicals (even non-poisons) in building up well or diseased structures. They only irritate the organs through which they are cast from the body.

The ideal man is one whose life is guided only by the truth; whose character makes him "hate every false way;" who seeks how to gain and retain a splendidly pure, strong, healthy mind, housed in as perfect a body as possible. The human body is incomparably more wonderful and beautiful than any invention of man. It is a crime against God's law and against posterity to abuse it, or let it degenerate into weakness and disease through wrong living habits. As we study its wonderful structure, the great wisdom and power of its Creator is revealed to us. We can become acquainted with God by studying his art (nature) as we may know the character of a man by what he produces.

Kensington, Md.

WOMAN SUFFRAGE.

RICHARD SEIDEL.

IN taking up this subject the writer feels it not improper to say that he holds a somewhat exalted opinion of womankind, and could never see any reason why they were not just as capable of exercising and enjoying every social and civil privilege that was claimed for himself. How any man can pretend to honor his wife or sisters, and then wish to deny them any political, or other rights and privileges that he enjoys, is past rational comprehension. The only way that such discrepancy of human conduct can be accounted for, is, that such men do not really love or honor those whom they profess to hold dear, only so far as those persons can and do minister to the selfish interests, enjoyment and personal vanity of the men.

It is high time that men of America are made to cease their empty mouthings and to appear as they really are, that is, as slave-holders, shackling their own female kith and kin, and enslaving them to obedience to laws that were enacted without their consent. This is a pretty severe indictment and will doubtless be sharply resented by those who are caught in this drag net accusation; but such do not, and may be cannot, analyze the underlying motives of their own acts. That woman should have every political privilege that man enjoys is so palpably plain, or ought to be, to a reasonable man, that there can be no other excuse for the contumacious position of the voters, that still keep her out of these rights.

It would seem that it is only necessary to bring the question of woman suffrage into public notice to cause

its immediate popularity, and that argument in its favor would be entirely superfluous, but after a half century of strenuous agitation in her behalf in this country, we still find most prevalent that moral obtuseness of the "old hayseed" who, upon being asked if he was in favor of woman suffrage, replied: "Oh, yes, jest let 'em suffer, let 'em suffer," to which ingorant and heartless indifference to woman's wrongs there can be little avail of reason. In fact, to me it seems utterly useless to go over the arguments favoring the political equality of women, or to meet and vanquish those sophistries that have been worn threadbare in the attempt to justify the opposition to it.

What is really needed in this matter is not argument; it is not the establishment of the truth as to what is right, but the thing needed is to make the voter feel or fear some loss of selfish interest, or that some selfish gain will not be attained unless he changes his attitude upon this question.

If the voter should be aroused some fine morning to discover all his long-suffering female friends rejecting his frowning flatteries and demanding justice instead, he would begin to realize that his duplicity in this matter was at least discovered, and that he must do something about it if he would still retain that honor among womankind, and still receive those kindly ministrations that he had so long been the recipient of, with the feeling that it was due on account of sex, and not because he was a man—that is—a manly man.

Many years of very intimate acquaintance with American human nature has revealed to me many noble traits of character, and many persons possessing them in a more or less degree, but unfortunately for the accustomed adulation of my fellow-countrymen, experience and observation has convinced me that there is only a small minority of them that can rise above considerations of selfish interests to act upon moral convictions, or to sustain a moral principle that does not conduce to some selfish advantage.

This idea is illustrated in the history of the anti-slavery movement. Those who first took up political opposition to the institution of slavery did not stop to ask, if such a movement would be profitable to them or to the country. It was with them only a question of the moral right or wrong of the thing, and having decided that, proceeded to act in accordance with their convictions regardless of the consequences to themselves. But, at best, those who composed the Free Soil party of the forties, and who merged into the Republican party in the fifties, comprised only a small minority of that anti-slavery party; nor could their philanthropic principles of absolute emancipation be made to impregnate and prevail with the greater mass of that party to sanction so radical and righteous an act, until the exigencies of war quickened their consciousness, bringing them to a realization of their interest in so doing, in actual dollars and cents.

So likewise, it is in the opposition to the saloon. For thirty years a Gideon's band of moral heroes have been crystalizing their efforts into a political party, injecting their opposition to the drink traffic into the ballot box, at each succeeding election, like David with his sling, confronting the Goliath liquor trade in his own chosen field.

Although this little party is comparatively few in number, and is jeered at and despised by the thousands of other non-partizan opponents of the saloon, it will be found when the victory is complete and the smoke of the battle is cleared, that its devotion to its convictions, its persistent agitation and its unerring astuteness in discovering and exposing all the strategy and designs of the enemy, educating all the time in the proper course to pursue, that it has really done more to make that victory possible, than all other agencies combined. As did the old Abolition party, it may not itself enter the promised land. The final victory may be won in another party's name, but it will have been the Moses who, with an eye singled to the only right thing to do, has safely led this cause through the wilderness of doubt and despair amid the pitfalls of party fusion and compromise with the iniquity of licensing a vice. It has now brought the people to face this question in a consideration, and actual experience of its advantages to them, measured in dollars and cents, tabulated in comparison reports from license and no-license states.

At last the people are being made to see how this robber business is going down into every one's pocket and picking more dollars than it ever can repay, and this knowledge is stirring their lagging morality a thousand times more than any sympathy for their fellow-man's wrongs could stir them, or any question of right or wrong could do, notwithstanding in that we claim to be a Christian nation. In consequence, there is now such a wave of active opposition to the saloon as never before, and the liquor papers are heralding their despair of ever being able to stem the flood that is sweeping away their business.

In this struggle, I doubt not, will come the opportunity of woman to gain her rights. The saloon is her arch enemy and it is not only invading and destroying her home and happiness, but is the main factor in barring her from political rights. Well has she learned this, and is making her fierce fight. She is in at the death of every saloon, knifing it at every bloody foot-step of retreating and facing its every gauge of battle.

That party, that may come, in the end, to close this struggle, moved not so much by the sense of justice and right as by the need of woman's vote to put and keep it in power, will hasten to give woman the ballot as did another great reform party give it to the negro for similar reasons, pretending it to be an act of justice and generosity, but at the same time continuing to

GOVERNOR HANLY ON THE NEED OF A MILITANT CHURCH.

From an address delivered before a great audience in
Chicago, September 30, 1907.

"THE world's need of such a church and of such
men and women is manifold and enduring. But if
there were no other, there is such need in a single di-
rection, in this, our land, as to call into exercise every
element of strength possessed and to inspire to as
high and to as consecrated service as the church has
ever rendered. Indeed, an oft repeated challenge lies
now at its feet. Unless it runs away, there is fighting
to be done. The field is nation wide. The issue is of
transcendent import, involving the welfare of society,
the faithful administration of government, the incor-
ruptibility of American citizenship, and the well being
of both the bodies and the souls of men and women.

The domain to be fought for is this Republic, its
manhood, its womanhood, its childhood, its homes and
its institutions—institutions founded amid tears and
sacrifice—institutions loved by the fathers and revered
by their sons—institutions for which men have died at
the battle's front, fondly hoping thereby to preserve
them to the last generation.

The trophy to be struggled for is a stainless flag,
the banner of the free—ensign of a nation redeemed
and glorified.

The foe is the organized liquor traffic of America.
It is an enemy well worth while. It has great wealth.
It is adroit and cunning. It is resourceful. It touches
the financial interests of many men. It is desperate.
It observes no law, human or divine. It violates leg-
islative enactments and tramples upon the most solemn
constitutional inhibitions. The rules of civilized war-
fare are to it a meaningless jingle of idle words. It
spares neither age nor sex. Its banner is a black flag.
It is an outlaw. Its god is Mammon. It has no re-
ligion but the greed of gain. No love that the lust of
gold does not corrupt. No pity that avarice does not
strangle. It is marshaling its forces for a conflict, the
impact of which will shake the land. The Christian
church of America must meet it or run away, and it
cannot run away. Its splendid, militant past, the mem-
ory of its martyred dead, preclude that. It must stay.
It must fight. And it will stay, aye, it will stay, and
it will fight—not one but an hundred battles before it

and House Committee. Under the proposed currency reform which Congress is considering, the country would be divided into forty-three clearing-house districts, each centering in the forty-three cities which the government now designates for the deposits of bank reserves. In times of need each of these clearing houses, that is, associations of banks, will be empowered to issue certificates which will be received by the Government and against which the Treasury will issue circulation. As security for their certificates the clearing houses will hold municipal, state, and railroad bonds. This emergency currency is to be under a tax of six per cent, which the men, who have framed the law, believe would insure its retirement as soon as the money scarcity was at an end. The measure does not conform to any of the plans which have been conspicuously pressed in Congress, by individuals and is sure to meet with considerable opposition both in and out of Congress. Southern business men want the banks to be empowered to issue currency against cotton held in warehouses. If Congress allowed such security there is no reason why it should not allow similar use of wheat in the West. The present plan would seem more likely to please the New York banking interests, for here there are plenty of bonds of the sort required, but a good many New York bankers are understood to prefer no currency legislation at all, to that proposed.

The Employer's Liability Act Unconstitutional.

By a divided decision of five to four the Supreme Court has declared the so-called Employer's Liability Act unconstitutional, thus sustaining the decisions of the lower courts. The Employer's Liability Act represented an attempt to compel interstate railroads to pay damages to employees or their heirs-at-law for injuries received while in their service. In the past the doctrine had been that the employer was not liable for accidents to employees due to the negligence of their fellow servants. Such a law was first urged actively by President Roosevelt in 1902, while the act overturning the previous action was passed in response to his recommendation in June, 1906. The President in his Jamestown speech of last year advocated the extension of employer's liability to all industries, in order that the suffering and loss incident to accidents should be distributed through the community. The unconstitutionality of the present law according to the majority of the Supreme Court lay in the fact that it applied indiscriminately to employees of common carriers in interstate commerce whether the employees were engaged in interstate commerce over which Congress has control, or in intra-state commerce, over which Congress does not have control. Justice Moody held the law constitutional at all points. Justices Harlan and McKenna held it constitutional so far as it applied to men engaged in interstate commerce. Bills have already been introduced by Senators Knox and LaFollette which meet the Constitutional objections to the present statute.

German Empire, is chosen on a franchise, the Landtag, the parliament on a plutocratic basis. The total received by the state is divided into a small number of wealthy men, who of the taxes, choose one-third of the second larger group of less wealthy second third of the taxes, choose the final electors; and the rest of the electors includes the working men, and number the last third of the electors. A score thousand wealthy men have the election as some four million of the electors chosen by the first and second combine to defeat the candidates of the comparative power of the money power. The Senate is as nothing to its representative. The Radical Liberals and Socialists demand manhood suffrage for this plutocratic Landtag. The question is now agitating Prussia next week, when the matter was to come before a great throng gathered about the Reichstag in Berlin shouting, "We want manhood suffrage." The Landtag itself the debate on the question of manhood suffrage was conducted in confusion. The head of the administration, a man of government, while believing that some day he did not consider that manhood suffrage was for the state. The motion for manhood suffrage in the Landtag without a division of opinion. The Landtag led to further demonstrations by the people in the main thoroughfares. There were collisions with the police, in one place at the Kaiser Bridge the officers charged with drawn sabers. Further rioting took place.

Japanese Indifference

In most countries should a person be killed on the street by a robber the victim would be pointed in expecting the assistance of the community. In Japan it is not so. Such an event is regarded by every Japanese as an entirely private matter, none of his business. A man of foreign gentleman was going down a street at about eight o'clock in the evening. He passed an open lot he heard a woman crying. A rikisha man wanted to ignore the cry and proceed with their fare; but the man refused to rescue. He discovered a young girl of age in the clutches of a Japanese girl, the foreigner tried to capture her. During this performance no less than a crowd of people came up to see the "fun," each one of them and refused to assist in arresting the offender, standing that the circumstances were trivial. They evidently regarded the whole as a trivial affair that ought to have been left alone.

THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

AN OVERSIGHT.

IN the recent article on the American Navy, we should have given credit to the *Scientific American* for much of the information contained in the article. We do so now at this late date.

In all original matter we aim to give due credit, always. Trite sayings, news and general information does not deserve such credit. If this rule is observed carefully, it will dispense with the common charge of plagiarism.

SIMPLIFIED SPELLING.

THE following list of words are so generally used by writers and scholars that we recommend their use by our contributors. The National Educational Association approved of this spelling several years ago: Altho, catalog, decalog, demagog, pedagog, prolog, tho, thoro, thru, thruout.

A CHANGE.

SOMETIME ago we promised to offer some prizes especially adapted to boys and young girls; some suitable for young men; others for young ladies, and a few for general use by everybody. A new arrangement in the business management of the INGLENOOK upset all previous arrangements so far as premiums and presents are concerned.

If anybody wants to secure INGLENOOK subscriptions, for either cash or premiums, write to the Circulating Manager, Brethren Publishing House, Elgin Ill. He will gladly inform you and employ you.

We call attention to this change so that our readers will not think that we promise something when we have no intention of carrying out our promise. Sometimes we may become tardy through sickness or other intervening causes, but never intentionally. If an overabundance of work was a legal excuse for irregularities then we would have just cause to omit, postpone,

and give up a great many promises, because our work has been extremely heavy, yet it has been very fruitful so that we go on without complaining. We want to work. We even like it, and plenty of it.

MAY THE LORD DELIVER!

THE above prayer is in behalf of all those who have to live and associate with sour people. These sour fellows are found in every community, in every church, in every factory. They must be treated with politeness and dealt with in moderation, although they deaden all affinity. Like acid, they eat away at your comfort and dissolve your securest affections. Like ether, they stupefy your desire to impart help and strength to your fellows. Like poison, they corrupt your entire being.

Do they speak? It is a tongue of sarcasm, sharp, and piercing as a serpent's fangs. Their words find lodging in your heart where they ferment in your soul for years to come whenever memory recalls the author's name.

If it is not opportune to speak, then their scorn is expressed in looks, which travel to the throne of feeling like electricity penetrates to the depths of the earth, and there their looks produce the same results as do their words.

Do you but come near them, their presence has charged the atmosphere around them so that you feel a chilling sensation. Gloom and a ferocious nature, sooner or later, envelops their surroundings, although they may hold positions of trust and reap but little of their just deserts from their burdened comrades. Their name is associated with a baneful, devilish nature by all those who have to endure their company.

Those sour people are the ones who never quit kicking, even when they are more than even with an opponent, but like the famous long-distance sharpshooters of war-time, they pick their victim with their deadly missile when he is far away in time and space and acceptably engaged at good works.

When once these sour people find one weakness in another, whether real or surmised, that weak spot becomes a favorite target for a lifetime practice with grapeshot and poisoned arrows. They never forgive another's mistakes, nor learn anything good which he may do, for every item of good which they hear becomes sour and snappish as soon as it enters their mind.

The remedy for these sour people has never been administered, because they won't take their medicine, or else their entire being is so saturated with poison that it neutralizes whatever is administered to them. Most of them are like the sick mule. His owner proceeded to cure him by rolling up eight doses of calomel in a long paper scroll one end of which he slipped into the mule's mouth at the side, expecting to blow

the calomel down the mule's throat, but the mule coughed first and blew the calomel down his master's throat and killed him.

To doctor these sour people, is a dangerous task. Beware! It's like playing around a mule's heels or tickling an asp's throat. Many who have attempted it, even with homeopathic doses, have either had their nature mysteriously soured as if by witchery, or else have had the joy of their life all extracted and died in despair.

A CORRECTION.

Holtville, Cal., December 22, 1907.

Editor of the INGLENOOK,
Elgin, Ill.

Dear Sir:—I notice an article in the INGLENOOK, of Dec. 17th, page 1205, on damming the Colorado River, taken from the *Circle*, that is erroneous. I have lived in the Imperial Valley as long as any one, and I think I know as much about it as any one, and it seems to me that if the author of that article had studied day and night for a solid year to see how bad he could misrepresent it that he could not have made it any worse than he did.

The truth is this: J. B. Lippincott of the Reclamation service denied the right of the California Development Co. to divert waters from the Colorado River for irrigation purposes, on the grounds of it being a Government stream. A. H. Heber, President of the California Development Co., then persuaded Congressman Daniels to introduce a bill in Congress declaring that the waters of the Colorado River are more profitable for irrigation than for navigation. In reality this was a bill to steal the whole river and when I heard of this bill, I wrote a letter to William E. Smythe, (Mr. Smythe is the father of the National Irrigation Congress), asking him if he could not do something to prevent the stealing of the river, and he replied that the best thing for him to do would be to go to Washington City and defeat the bill.

He went, and that at his own expense, and succeeded in defeating the bill, but in the discussion of the bill before the House Committee on Irrigation, when Mr. Heber saw that the bill was going to be defeated, he said "I like to worship at our own shrine when I can, but if I can't I will worship at the shrine of Mexico. I will, upon my arrival home, set teams at work and make a canal wholly on Mexico territory." This meant that if you won't let me steal the whole river, I will steal half of it any way, for Mexico is entitled to one half of the waters of the river. And Mr. Heber did just what he said he would do: he dug a canal entirely on Mexico territory, but for some cause did not install a gate to regulate the flow of the water, with the result that the channel of the canal washed out so deep that it turned the whole river down the canal in to Salton Sink.

But in regard to the amount of damage done, the writer of the article exaggerated very much. There were only a few farms washed out and only a very few inundated. I wish to say right here that the greatest damage was not in being overflowed, but that the channel being washed out so deep we could not get water to run in to our canals. The main part of the valley did not suffer from this trouble even,—only two districts, Nos. 6 and 8, which were the newest part of the valley, and preparations are now being made for them to get water again by next spring. There was not a single town abandoned as the writer of the article says, for only a small portion of Mexicali on the Mexican side of the line was washed out. Neither did the settlers have to move out, only in the new settled districts above mentioned, and they did not leave the country. I have been here all the time since November 1900, and have not been without water a single day unless it was turned out to clean the canals. Furthermore, President Roosevelt did not say that land would be worth from fifty to fifteen hundred dollars per acre, but what he did say was that when the land was thoroughly developed it would be worth from five hundred to fifteen hundred dollars per acre. I suppose he meant when it was set to oranges, apricots, or grapes.

The river breaking in will be of far more benefit to the United States than it will be damage, for it has made far more good land than it has washed out.

W. F. Gillett.

Holtville, Cal.

THE above letter reveals what many have already known about much magazine matter—that many high sounding, finely illustrated and widely advertised articles are merely creations of a fertile imagination.

A writer for fame and money will seek some isolated district and weave a story of wonderful force and facts for the reading public. Since not one person in ten thousand ever visits that same locality, or even care whether the author is sincere, and no magazine will correct such a give-away on themselves, we seldom learn of the cruel manner with which such writers distort facts and mislead people.

We thank Mr. Gillette for his prompt rebuttal and we shall see that the original publishers of the article get his information. We are glad that none of the INGLENOOK writers are guilty of such exaggeration.

Editor.

THIS would be a dismal world if all men were successful financiers and none were dreamers.

THE church that starts to eat itself out of debt usually winds up with a bad case of moral dyspepsia.

**MEDICAL.****No. 2. Egg-Water.**

DR. B.

To half a glass of cold water add the white of one egg and a very little salt. For children a little sugar, also, may be added.

This is a valuable diet in stomach or digestive disturbances, it matters not what the sickness may be. In any sickness where there is great thirst, a swallow or two may be allowed and it is of more lasting results than even plain water.

After a severe case of cholera morbus or cramp colic; through sieges of dysentery; or typhoid fever; or following the vomiting in eruptive diseases, this simple diet should be remembered and given in quantities of from one teaspoonful, at short intervals, to the entire quantity every three hours.

In all digestive troubles of children it will many times sustain the strength of the little sufferer if given in but small amounts and often repeated. In cholera infantum and dysentery of small children, one teaspoonful, or a little more, will remain in the stomach when no other diet will, and if given cold will be readily taken.

For dyspeptics the whites of two eggs may be added to one glass of cold water, or sweet milk, with a very little salt or sugar, or both. This alone may constitute a meal every three hours and will give ease to an irritated stomach.

Other simple diets which are useful in many delicate conditions of the digestive organs of either children or adults are as follows:

Rice-Water.

To one pint of water add one tablespoonful of washed rice, cook well, and when done strain; to the liquid part season with a little salt or sugar, or both. This liquid is in value next to egg-water and useful in many digestive troubles. It may be given to children in from one teaspoonful to four teaspoonfuls according to demands for nourishment.

Oatmeal or barley-water may be prepared in same quantity as for making rice water, and are very serviceable as a diet in many forms of sickness. Season and serve hot or cold.

As a morning meal dyspeptics may profit by taking one cupful of either of the last three mentioned liquids

and add the white of one or two fresh eggs, always leaving out the yolk.

* * *

OUR CHARITY COLUMN.

WHAT this world wants is action. People know enough about good works; they talk enough about doing charity, and write enough to inspire to action, but do we suit the action to our words?

The INGLENOOK has always occupied a clean, moral position, but what has been our definite results? A door has opened up to us lately by which the INGLENOOK family can do one of the greatest works that any society in the United States can do. In the Christmas issue, we described two orphans,—Evelyn and Bobby, who needed homes and hearts that love children. Three applications have been filed in our office for the little girl, so that she seems to have been the recipient of a valuable Christmas present from the INGLENOOK.

The editor knows what orphan life is, and that this is a neglected field of work by Christians in general. Since this definite result from one issue of our magazine has come to our notice, it leads us to ask the question: How many orphans could our family care for each year, if there was some central medium by which orphans, needing homes, and homes open to receive orphans, was established? If three homes have been found already it indicates that more will be found in time to come.

Here are three fields of work which we expect to keep before our readers: 1. Orphanage work. 2. Rescue work for unfortunate women and girls. 3. Reformatory boys and prisoners.

Some band-box people despise such classes as those just named, and also those who try to help them, but there is where they magnify their own devilish nature. If a description of any orphan child is given us we will keep them on file, and when an application for such children is received we will put the parties in communication with each other. Let us have your help for the fatherless, the outcast and the convict; they are all capable of being redeemed, transformed and becoming our associates in heaven. Therefore let us extend God's love to them here.

* * *

ADVICE may be wrong, but examples prove themselves.

The Snow Man

Ida M. Helm

ONE winter morning Fritz awoke to find that through the night the snowflakes had been busily falling, and flying, and skurrying, and piling themselves up till the window panes looked as though they were set in beautiful white frames. He arose and looked out of the window and saw that the snow was piled in great banks around the house.

"It looks as though the mound-builders returned last night, and with busy fingers built new mounds for us to wonder at, and then, e'er the morning dawned, hastily returned to the place from which they came. This is Sunday too, it will be jolly to ride to church

she must stay in the house today. Will you be so kind as to stay with her while papa and I go to church? I would stay at home and let you go but grandma is expecting us to go home with her for dinner and she will be disappointed if I do not go."

For a moment Fritz's face clouded and he felt cross. His disappointed looks were the means of casting a shadow over Lucy's face at once. She said, "I wish I were back in Florida at my home, then you wouldn't have to be disappointed." Then Fritz smiled and manfully said, "I'll stay home with you, Lucy, and we will have a lovely time all by ourselves; we will take a sled-ride some other day."

Before starting to church Mr. and Mrs. Gordon cautioned Fritz Lucy about the danger there was of Lucy having a sick spell if she would play in the snow. The children promised that they would stay in the house, and be very careful that Lucy should not catch any worse cold.

"You are a good boy," said Fritz's mother; "you have always been faithful in your promises to us and I know that we can trust you."

After they started to church, Lucy told Fritz about the orange groves

in the sled, and cousin Lucy can have her first sled-ride, for she says it never snows in Florida, where she has always lived. Won't she be tickled when she sees this snow?" So thought Fritz, as he hastily dressed himself.

He then rapped on her bedroom door and called, "There's a deep snow, Lucy, we will all have a sled-ride today." When he entered the living room he found Lucy already there.

"Isn't it lovely," said Lucy. "I wish I had a snowball, but I have caught a severe cold and Aunt Harriet says I must not touch the snow today."

"Never mind about snowballs today, we'll make snowballs some other day; we can go to church today in the sled," answered Fritz.

While he was speaking, his mother entered the room and said, "No, Fritz, Lucy has a very bad cold and

and the beautiful flowers that grow in Florida, and she sang several negro church songs for him, and said that some of the little negro girls were friends of hers and that she intended to write a letter to one of them in a day or two. Fritz told her of the fine times that he and his little friends had the winter before coasting down hill, throwing snowballs, and making wonderful snow-men with brown chestnut eyes and red flannel lips.

At noon Lucy helped Fritz to prepare dinner and then she washed the dishes while he gave his kittens and pet squirrels their noon-day meal. Then Fritz brought out his box of Sunday-school cards; his book of "Bible Stories" and "Among the Giants." They were having a fine time when some one rapped on the door. Fritz was so busy explaining the meaning of his cards to Lucy that he did not open the door.

but simply called, "Come in." Quickly the door flew open and there stood Grace, Harry and Lee Long, their eyes sparkling and their cheeks aglow with ex-

citement and fun. "Come with us, we are going to make a snow-man," they cried in a chorus.

In a minute Fritz slipped his cards into the box and placed it on the table with the two books; then he thought of Lucy's cold and said,

"We can't go, because Lucy has a cold."

"Oh, pshaw, I had a cold last week and I went to school every day and it didn't hurt me one bit," said Grace.

"I'm afraid Lucy might get sick," replied Fritz.

"Mercy she doesn't look as though there was a thing wrong with her," argued Grace.

"Indeed I don't feel one bit sick, and I'd like to help make a snow-man," declared Lucy.

"But we promised papa and mamma that we would stay in the house," said Fritz.

"Oh, ho, we will have the snow-man finished and you can be back in the house before your parents get home and you don't have to tell them and they will never know it," coaxed Harry.

"I don't believe we ought to make a snow-man on Sunday," said Fritz.

"Why not? Making a snow-man is not work, it's just play together and being sociable," said Lee.

Long, long ago, when the world was in its infancy and Adam and Eve were living in innocent happiness, the tempter came into their lovely home, and with lying lips and alluring, deceitful promises he tempted them until they yielded to his temptation and disobeyed their Maker, when, alas! they lost their beautiful, sinless home. That tempter has continued tempting and deceiving men and women ever since. With marvelous boldness and with all the craftiness that he could devise, the tempter even assailed the Son of God, but was defeated and his power was broken. But he is still the same cunning, deceitful being that he was before then and no one who has arrived at the age of accountability is free from being tempted by him. He is strong; he is stronger than I am; he is stronger than you are; and in our own strength we are not able to withstand the influence of his sly artifice. There is one, however, that is all-powerful. Jesus has broken the power of Satan and if we will put our trust in him he will give us grace to overcome all the crafty devices that the tempter is able to plan.

Fritz and Lucy, instead of positively saying, no, when it was plain to them which was the right and which the wrong way, began arguing with the tempter, thinking of the pleasures that he was holding out to them, and, like so many other tempted ones, they listened to and debated with the tempter till they cast their promises to Mr. and Mrs. Gordon aside, and yielded to the temptations that professed to hold innocent enjoyment for them. Fritz took extra care in putting warm wraps on Lucy and they went out with their companions and had a merry time. They made snowballs and threw them at each other; then they

made a snow-man and finished him off with a piece of fur which they used for hair. They gave him lips of red flannel, and they used large, black buttons for eyes. When they had him finished they all agreed that he was the finest specimen of a snow-man that they had ever seen, and, oh! how they enjoyed looking at him.

As the sun began sinking in the west Fritz and Lucy went into the house.

Soon Mr. and Mrs. Gordon returned home and when they saw Lucy's face looking very red they questioned her, but both children declared that it was caused by her having been in the very warm room all day. Wrong cannot always be concealed, and in the night Lucy took a chill and fever, and they had to send for the doctor. Then the whole, dreadful truth had to be told. How sorry Fritz was now that he had yielded to temptation. These words that his mother had uttered just before she started to church, "You are a good boy, Fritz; you have always been faithful in your promises to us and I know that I can trust you," stung his conscience like fiery nettles. "Surely they never can trust me again," he thought, while tears of penitence trickled down his cheeks. "I never can undo the great wrong that I did today, but I can profit by my mistake and never be found guilty of such a sneaking act again," thought he.

Lucy had to stay in bed for four long weeks, and the doctor would not allow her to go out of the house till the snow and cold weather were all gone and the warm days of spring had come. Sin had robbed them of all the enjoyment that they had anticipated. It dashed the bright visions of sled-rides and snowballs into pieces and it filled the winter days with sorrow and gloom.

The germs of the punishment of sin are sown with the act which commits the sin, so that not one sin ever goes forever unpunished. Sometime, somewhere, the seeds that have been sown will yield their harvest if they are not rooted out. The grace of God can take away the spontaneous sin from the heart, and the mellowing influence of his Spirit will cause the flowers of love and truth to spring up and yield a beautiful harvest; but we must put our trust in the One who is able to give us grace and strength to resist the tempter, and then cleave to truth and right. The lesson was a costly experience to Fritz and Lucy, and they never forgot its teachings.

Ashland, Ohio.

A LIFE TERM SENTENCE.

ABOUT one year ago Herbert Spring, a young man of Rockford, left his home in that city and went to Freeport, about 28 miles distant. According to his testimony, about the first thing he did was to go into a saloon and get a drink. He was a minor, but he got his drink just the same. And then a little later on, according to his testimony, he had quite a number of drinks. The result, of course, was that he became insanely intoxicated.

On the afternoon of that day Mrs. Edna Rumel-hagen started down town to do some shopping. She was pushing before her a baby carriage, in which her six-months-old baby sat cooing. Little did this young

mother and proud mistress of her home dream of the fate that awaited her. Without any warning whatever she was set upon by the above-named drunken boy, who, in his imaginary delirium of intoxication, began to fire at her the contents of his revolver, and finally one of the bullets pierced her heart and she dropped dead.

The young lad was arrested and lodged in jail, where, after he had slept off his drunken debauch, declared that he knew nothing whatever of his movements. But that did not change the situation.

The young man was tried, pleaded guilty, and sentenced to a life imprisonment of hard work in the Joliet penitentiary. The sentence pronounced by Judge Farnand contains some awful warning, and some splendid advice, which, however, came too late to prevent the prison doors closing forever upon the life of a young man not yet twenty-one, but it may suffice to cause other young men who are becoming reckless to pause and think.

The sentence is as follows:

"During the past five years seven men have been before me charged with murder; four have pleaded guilty, three have been tried by jury. In each case the defendant was under the influence of intoxicating liquor at the time the offense charged was committed, as you were when you committed the crime to which you have entered the plea of guilty.

"Intoxication cannot be considered as a defense in this case. The young man who at your age has become a frequenter of saloons and an habitual drinker of intoxicating liquors is almost certain of moral death before he reaches mature manhood. Oh, could I speak to the young men of this nation I would beg of them to shun the saloon; let not its shadows fall upon you; they will blight and finally destroy your young manhood, bring unutterable sorrow to those who love you, and hasten you prematurely to the grave or to a home within the prison walls.

"Two years ago at Dixon a young man of your age stood before me to receive his sentence on a plea of guilty to the crime of murder. What I said to him then I want to say to you now. There are two great lights which should always control the court in a case of this nature—first, justice; second, humanity. I have given much thought in my efforts to determine what justice demands; what humanity asks, in this case. We cannot bring back the dead; a life has been taken and the lifeless body of one has been laid in the grave, and if it comes again it must be only when God commands that the earth and sea give up their dead. We are to deal alone with the living.

"During the progress of this trial there has been a picture constantly before us which has caused the court to think deeply of the tragedy of life and the mystery and sorrow of death. Upon one side the mother and father, widower and motherless child of the one

who sleeps; upon the other the mother, father and other members of your family; all sorrowing, some for the dead, others for the living; and it is difficult to determine which of the sorrowing ones suffer the greater grief. All this has come because of your cruel act. But through and beyond the dark clouds of sorrow and the tears of grief the court must look alone to the evidence and there search for the light which leads to the right.

"You are a young man just having passed your twentieth year. In law you have not yet passed from the scenes of childhood to the more dignified and responsible one of manhood. Yet you have mental powers sufficient to discern and follow the right and to know and fully understand the consequences of such a crime as you have committed. She whom you shot to death was younger than you, yet for a brief time she had borne that almost sacred name 'mother.' Her heart, which beat in love for her first-born, was pierced by a bullet fired from the weapon in your hand; the breast that gave nurse to her infant child was chilled and she slept.

" 'My God, my baby, I am dying,' were the agonizing and pathetic words which fell from the lips of your victim just before she passed into the valley where the shadows of life faded away and the twilight of eternity broke upon her. Those words will at times ring in your ears until the morn of that day when you, too, must pass into that valley, and if the light which then breaks upon you from the further shore is radiant with hope it will be only because an offended but all-wise and merciful God has forgiven you your awful sin.

"Under the sentence I am about to impose you shall have ample time while in prison to think of the past and meditate on the future. Day by day, week by week, month by month and year by year, until the sands have run out of the dial of your life, you shall wear the garb of a prisoner; the narrow walls of the criminal's cell shall be your abiding place. When the iron gates close behind you the beauties of life and the grandeur of nature shall be hidden from you, and home and mother will be only memories. But let them be sweet memories. Remember the teachings and virtues of that mother whose heart is bleeding with agony today. Her love will follow and bless you in your darkest hours. I sometimes feel that a mother's love has in it a spark of divinity. I know not the time nor place, when nor where, the love of a pure mother will not enfold her child. Under the influence of that love prepare yourself, yet, to live according to her teachings and her prayers. There is a God in heaven whose infinite power and tender mercy can and will penetrate the gloom of a prison cell. His power enables him to search and know the human heart. You have transgressed his laws. He alone can give you solace in the coming years of grief.

"It is the sentence of this court that you be im-

prisoned in the penitentiary at Joliet for and during the term of your natural life, the first day of that imprisonment to be in solitary confinement, balance of time at hard labor, and that you pay the costs of prosecution."

GRANDMA.—Number III.

Old age, itself, lends hallowedness to character, but when aged people live in the eternal sunshine of heaven, so far as their thoughts and affections are concerned, yet remain on this side of the river of death with us, then their old age becomes twice blessed. It is blessed to them to have their minds feasting on, and filled with heavenly enjoyment continually, and it is blessed to us to have such sacred company here. Such an old age is the childhood period of immortality. Their citizenship and interests have all been transferred to the glory side of our existence, but their residence has been wisely prolonged among men in order that they might leaven some part of the human race for better service, both here and hereafter.

We have seen grandmothers sit for hours, day after day, and read the Bible as though their attention was riveted fast to the book, or as though they had never heard its sweet message before. Sin, worldly pleasure and selfish ambitions had all vanished, and, as the Book has promised, "The pure in heart shall see God," these sainted pilgrims saw God anew and in fuller measure as their hearts became free from temporal things.

There is nothing that can add so rich a quality to our grandmothers, and enshroud them in a halo of glory, as a daily, devoted study of God's word. Such a life emits a fragrance in the home and neighborhood that is relished by saint and sinner alike.

What does it? Living with God. He will transform any who seek his company, whether young or old.

WHAT is the number of the Congress now in session? If you do not know, what figuring will tell you? For how many years will each of Oklahoma's senators serve? How is that matter determined? Is this the long, or the short session of Congress? Why long, or short? What are the main things recommended by President Roosevelt in his recent message for Congress to consider at the present session?

SOME OLD TIMERS.

A SHOE dealer sells a pair of shoes for \$5, and is tendered a \$20 bill in payment. Unable to change it, he takes it to his neighbor, a grocer, and gets change for it.

Later the grocer returns the bill, which has proved a counterfeit, and demands his \$20. How much is the shoe dealer out?

The Influence of Our Early Home Life

Maggie M. Winesburg

THE influence that we feed upon in our early life is the keynote of our lives in later years. No matter where we go or what we do, we can always trace our present actions back to some influence we felt in our early home life.

Those influences, which affect our lives in after years, may not be visible at any time to the eyes of an observer, and often we cannot trace any outward evidence to the influences that have helped to form our course in life, because those influences were made up from a thousand small atoms in an undercurrent that is felt but not seen.

While I do most emphatically believe in good, careful training, and think that every family's human garden should be carefully weeded out and its tender plants trained to climb and grow upright, yet observation has shown me that there must be something more than the outward training, that shapes many a life, because I have known children who grew up without anything that could be called training—rather in what is called a harum-scarum fashion—and they have turned out to be the best of citizens. Again I have known others, who were trained under the best of home rules, polished in speech and action—but broke away from the home ties and became the wildest of the wild.

Now probably in the last-mentioned case, the external home rules had been just a little too strict, and the

undercurrent within the parents' lives flowed cross-ways beneath the fair outward surface, so that the subtle, unseen, inner influence took effect on the ones they were trying to train aright and caused them to go wrong.

Many a successful man and woman in the world thinks that their early home life had very little to do in the forming of their plans, because their early life was one hard struggle with poverty, and kind words and actions were few and far between. Just look back over your early life and see if it was not some in-

fluence there that first touched the keynote of your after life—some unseen power that awoke within your heart a desire for better things—some undercurrent that flowed through your daily life which spoke of the hopes that had once filled the hearts of those around you. It might have been one of those mystic influences of nature, which often calls to us from the rocks and rills, or it might have been to escape the influence that you disliked that spurred you on to strive for something higher and nobler in life.

Good home training, strengthened by a good ex-

ample set before them, has kept many youthful feet from the downward road, while bad home training and bad home examples have sent many other youthful feet on the wrong road. But there are some natures that are not influenced by outward forms or rules; they are swayed more by that invisible something we feel but

cannot see. The finest churches that were ever built have not the effect on this class that the rugged cliffs and sunlit valleys have. No eloquent sermon hurled from the pulpit ever awakens the divine love in their hearts as do the songs of the birds, or the rippling of the water, and that throbbing, breathing but invisible life which is in the air. These generally shape their life by those invisible influences for weal or woe, and while they listen to instructions yet that subtle some-

thing tells them just how their instructor stands himself.

It is what we feel rather than what we see that moulds us most—the subtle, silken cord of human instinct and intuition. Rules and training are just the fences that we build around our home lives, but it is the invisible forces that make the home life a paradise, or else just an abiding place.

I have been in homes where the father and mother were seemingly as good as anyone could be in their mode of living—polite, refined and good in all their ways; the children correct in speech and action, yet to me there was something lacking, and I have been glad to leave that home, and run to the household where—if speech was not at all times grammatical, and the children were noisy, yet there was a subtle something there like the perfume of a hidden rose, which made that home dear to the ones that lived within it, and an outsider could feel its presence.

THERE is considerable difference in praying for what you want than praying for what you need.

A SUGGESTION.

BY EFFIE E. MILLER.

READERS, what do you do with your INGLENOOKS after you have read and, perhaps, reread them? Do you store them away in your trunks, bureau drawers, boxes or garrets? I hope that you do not throw them about carelessly. No doubt each one has his or her own way of doing things, but perhaps a little suggestion from some one else might benefit us all, at times. You, who read the INGLENOOK, know how eagerly you look forward to the day when you will receive a new issue, and how much you enjoy its contents. After you have read the last issue you look forward to, and wait for, the next one, so have not much time to look over old ones.

Now can you think of some person near your home that cannot afford to take a paper, who would be delighted with such reading as our paper furnishes? I am almost sure there is some one to whom you can hand your paper and it would be appreciated. There may be some special articles you would like to keep, if so, cut them out, but be careful not to cull too much, or you may leave the impression that you are only giving to your neighbor what you do not want.

What I have already suggested came to my mind after I had stored my INGLENOOKS away for several months. I made them into bunches of five or six papers to a bunch, and gave them to those of my friends who were not taking the paper, with the understanding that they could either keep them or pass them on to some one else, after reading them.

Will you not try this? I am sure you will feel better if you do. You know we should not keep all the good things to ourselves, but pass them on to others that they, too, may be benefitted.

Jonesboro, Tenn.

YOUNG MEN WANTED.

C. L. ROWLAND.

IN this age of materialism and competition, money getting seems to be a beam in the eyes of both employer and employé. Young men are wanted for positions of trust and honor which pay large salaries, and scores of them are leaving the good old farm to prepare for these fat positions. Many spend just enough time in school to get through with the prescribed course of training which gives a diploma. The next thing of importance to them is to find employment where these large salaries are offered. Their all seems to be bent toward making money regardless of other considerations.

Many parents would provide their children with the money to pay for college education if they were very sure that their children would be enabled thereby to make more money. They seem to overlook the great truth that "knowledge is power" and will make their

son and daughter worth more to the community in which they live and to the world at large. Such parents have forgotten that to be in possession of money alone, will not bring happiness or peace.

An education is worth more than money, and after all, our money is worth only what good we can do with it, because the time is here when we must take a more sensible view of preparation for life. We must prepare ourselves not only to get, but to give, as well.

GREETING.

FROM the many greetings we received from our readers about January 1st, we pass this one along to the INGLENOOK readers because it truly expresses the Editor's mind.

All good wishes send I thee;
Wishes that this year may be
One of happiness complete;
Filled with all that makes life sweet,
Bright with gifts for thee, the best—
Joys, and love and glad heart rest—
That shall yield in after days
Happy memories of praise.

Our National Wastefulness.

The Geological Survey is sending out some most timely and important bulletins. It shows that we allow more timber to be destroyed every year by preventable fires than is used in all the lumbering industries. It draws attention also to the fact that there is an enormous amount of coal left and lost in the mines because of reckless processes of mining.

The size of our country and its enormous natural resources have led us to believe that many things were inexhaustible, which as a matter of fact are being utterly and ruthlessly wasted at a most extravagant and foolish rate. Our people have developed habits of prodigality which, in a country less lavishly favored by nature, would spell ultimate national bankruptcy. In the matter of fires, for instance, we have reached the point where we really expect and plan for terrific losses. As an example, Washington's record which has just been completed, shows that there were 470 alarms of fire in the year, resulting in damage of only \$250,000. This is one of the lowest and most satisfactory records attained by any city in the land; yet these fires have inflicted a damage, small as we believe it to be, just 350 per cent greater than that suffered by the average of sixteen European cities of equal size.

Incidentally, all the fire adjustment and the other accompaniments of the San Francisco disaster have been tabulated and arranged; and it now transpires that what was supposed to be a total damage of about \$350,000,000 amounts to much nearer \$600,000,000. Only \$200,000,000 can be properly charged up to insurance, and, therefore, the country has suffered a total wiping out of existence, an obliteration of property, to the amount of \$400,000,000 by that one fire. This is a matter worthy of our most serious consideration. It should teach us to build so as to make impossible the recurrence of such an awful conflagration, a recurrence that is imminently possible now in several cities, notably New Orleans, Boston, and Philadelphia.

THE PETROLEUM OUTPUT.

Producing petroleum is a profitable proposition, especially in these United States. According to a bulletin of the United States Geological Survey our production was 126,493,936 barrels of the total value of \$92,444,135.

This is where it came from:

	Quantity, barrels.	Value.
California,	33,098,598	\$ 9,553,430
Oklahoma and Kansas,	21,718,468	9,615,198
Ohio,	14,787,763	16,997,000
Texas,	12,567,897	6,565,578
Pennsylvania,	10,256,893	16,596,943
West Virginia,	10,120,935	16,170,293
Louisiana,	9,077,528	3,557,838
Indiana,	7,673,477	6,770,066
Illinois,	4,397,050	3,274,818
New York,	1,243,517	1,995,377
Kentucky and Tennessee,	1,213,548	1,031,629
Colorado,	327,532	262,675
Wyoming,	7,000	49,000
Michigan and Missouri,	3,500	4,890

It will be noted that California holds first place as to quantity produced—nearly one-fourth of the total production of the country—while Oklahoma (including Indian Territory) and Kansas together hold second place.

In value of oil produced Ohio stands first, with Pennsylvania and West Virginia second and third. Kansas and Oklahoma (including Indian Territory) jointly have fourth place, with California fifth, while only \$63,000 out of \$9,615,000 short of ranking fourth. The order of the other oil States in value of output is: Indiana, Texas, Louisiana, Illinois, New York, Kentucky, Tennessee, Colorado, Wyoming, Michigan and Wisconsin.

The greater part of the California and Gulf fields oil is consumed as fuel, while only a small proportion of that from the other fields is so utilized. Any of the oils can be made to produce more or less of a commercial product.

In 1906 the consumption of fuel oil in California was greater than the total production of the State for the year, says W. T. Griswold of the United States Geological Survey, in an advance chapter from "Mineral Resources of the United States, Calendar Year 1906."

The chapter also draws attention to the extension in area and increased daily production in the mid-continent field; to the falling off in production of the pools of the coastal plain district of the Gulf States; to the continued decrease in the daily production of the Appalachian field; to the laying of the second pipe line from the mid-continent field to Whiting, Ind., and (more than all) to the building of a pipe line across the Isthmus of Panama for the delivery of oil from the California field to the Atlantic Ocean.

The annual report of Probation Officer George W. Grover, of Maine, for the year ending Dec. 31, 1907, shows that during the year 591 respondents were placed in his care. 521 men, 20 women, 48 boys and two girls. Of these persons 495 were arrested for intoxication and 47 for larceny.

The term of probation of 296 have expired without breach of the conditions, 31 have paid fines, two have died, 28 have been surrendered into court by the probation officer and 71 have been arrested for other offences by the police department and brought into court.

From the superior court there have been placed on probation 18 men, 5 women, 2 boys and 1 girl. Of this number 16 are doing well; one has paid the costs of court and his case has been nol prossed; one has died; one has been placed in a home for girls; one has been brought by the sheriff's department for another offence and sentenced; two have not been heard from; and four have been unsatisfactory.

WANDERING afar is not essential to the welcome of home.

CREAM OF MAGAZINES

THE FLOWERS OF THE FRIGID ZONE.

A paradox of the arctics is the sledge-and-dog-team quest of wild flowers. Not into the floral bloom of the well-watered, heavily timbered Dawson, Yukon country, or luxuriant southeastern region, but to the bleak, timberless Northwest, where summers are generally given to fog and rain, does the quest lead.

Arctic Flowers.

Seward Peninsula, which is northwestern Alaska, covers more than 22,000 of Alaska's 600,000 square miles. In this area, inseparable in the popular mind from perpetual ice and snow, grow in riotous profusion about 167 varieties of wild flowers and seventy-five different kinds of grasses, while fern, sea, and lichen mosses are without end.

Few are the wild flowers of California or the Middle States that have not counterparts in the Nome tundra and inlying hills, besides many species unclassified and indigenous to the frozen North.

Where has Flora such a bed as the tundra? Running parallel for miles with the beach, the tundra stretches back from Nome four or five miles to the foot-hills, to

be lost in the Sawtooth Mountains, in whose shadows nestle violets, which recall with a sigh the remoteness of far-famed Parma. The tundra is decayed vegetation. Scrape off the surface, and rich black soil is revealed, soil that lies in varied depths upon fields of solid ice—the unmeltable ice of centuries. When wet with incessant rain or melted ice that oozes up as the continuous summer sun burns down, the tundra is a spongy, dangerous bog. Many is the "musher" or horse crossing the country that has been swallowed up in its slimy embrace. Everywhere the tundra is broken by natural lagoons, and of late by man-made ditches in the interest of mining, for there is not a foot of the tundra that is not staked!

In dry seasons, as was the summer of 1906, the tundra crackles under foot like burnt paper. Its chief ingredient is reindeer-moss. Wet or dry it is Flora's domain.

Owing to heavy snowfalls and deep drifts, this unsheltered, unforested background of our most northerly seaport—Nome—yields tardily to spring's wooing. To learn the haunts of the earliest flowers and pluck them from their ice-beds before they cease to bloom, one must have lived three years in the Peninsula; in the vernacular of the country, thrice seen the ice "come in" and "go out."

Long before Jack Frost removes his fetters from Bering Sea—for these arctic waters are hermetically sealed eight months of the year—and while the snow is sweeping in avalanches down the mountainsides, whirling through creek and river beds in mad, joyous dash to summer seas, many of the wild flowers blossom and are no more. Their life is brief as some of the most brilliant butterflies.

The flower-hunter who would gather spring's first blossoms must be off with sledge and dogs not later than the middle or last of May. Often so perilous is their abiding-place that sledge and dogs are abandoned on the trail to coquet with the snowbirds, while the hunter wades hip-deep through miles of slush and water.

One of the hardest, most enthusiastic flower-hunters of Nome is Mrs. Carrie Power, who aspires to do for the flowers of the arctics what a similar ardent Nature-lover has done for the flowers of Colorado. That there is no place for petticoats in an early flower-hunt, Mrs. Power avers. The prime requisites for comfort and expediency are hip rubber boots, plenty of blotting-paper, and a substantial lunch. As an appetizer and a tonic there is nothing to excel an arctic dog-team wild-flower hunt.

Many of the earliest spring flowers are so saturated with moisture absorbed from their icy beds that they require immediate pressing, and much blotting paper goes limp in the process before they are ready to be put in a book and tucked under the sledge-seat, preparatory to the dog-team "mush" back to camp. When this excessive moisture is thoroughly dried out, the color of the flower is often radically changed, giving little trace of the glorious hue it displayed when, pulsating with the sap of the arctics, it basked in a sun that never goes to bed during four riotous months. The first flower to greet the lonely prospector, miner, or "musher" in his weary

trudge across the hills of snow and ice-incrusted divides is the "star-of-day" (*Pulsatilla patens*). It grows among the rocks, and shows a single bright blue flower—with numerous black stamens but entirely devoid of calyx—atop a slender stock which springs from a brown stump. The buds are not unlike tiny balls of wool, while the entire plant is covered with fine, silky white hairs. Half-way from the base of the flower three deeply lobed leaves form a whorl. From the flower's white heart comes the name—"star-of-day."

Another of the earliest beauties is bird's-eye, common to many of our States. When the snow vanishes, it blooms in the dry knolls of the tundra. Every color of the rainbow is the bird's-eye, from pure white to deepest lavender and warmest pink, and in growth is not unlike the mustard-plant, the stalks varying from six to ten inches in height. It grows largely among scrub willows and in sheltered places along the creeks, and blossoms throughout the entire season.

A less beautiful but fragrant blossom which precedes the "star-of-day" in fruition is the Mayflower. In warm hollows along the creeks beyond the tundra, and occasionally on the edge of the tundra on the beach line, close search will disclose it toward the waning of May. It grows from a bulbous root, stands erect, is about four inches high, and has a cone-shaped head. The flowers are a muddy white, and cluster upon a thick reddish stock with a single leaf two inches below the flower-head, and a second single leaf at the base of the stalk. The short, pointed leaves of dull red completely encircle the stem, and the entire plant is covered with a white lint or wool. It is a curious fact that even as Nature provides the native dogs with heavier coats in winter, so are many of the first flowering plants covered with a protecting lint, wool, or hair.

There are seven varieties of anemone. On the beach, in the foot-hills and tundra back of Nome, Mrs. Power, who came into the country with the gold stampede of 1900, has discovered six species, unclassified and unknown to botanists. Like the anemone of the Sierra and Rocky Mountains, these spring beauties of the arctics love the cold. With frigid passion they are wont to burrow their way through banks of melting snow. The yellow and white flourish along the north bank of Dry creek and the sides of the hills, while several other varieties are found on Anvil Mountain, at whose base is the creek from which was taken the Peninsula's first great gold find.

The most beautiful species of anemone grow in great mats upon dry rocky sides of the mountains where soil is scanty. Severed from its native fastenings, a two-foot mat filled with hundreds of blossoms has been preserved for weeks simply by laying it upon moist ground. The flower of the finest arctic anemone is one and a half inches in diameter, with petals varying in number from six to nine. In color it is pure white, with numerous yellow stamens, while the calyx is green, and spreads into eight-pointed stars. Each section of the star is covered almost to the point with brown hair. The flower rises on a slender stem three inches from a mat of dead leaves. The entire plant is gummy, and when crushed emits an agreeable resinous odor.

All over the hills and marshes grow many varieties of buttercups, or cowslips, and the gathering of them for the herbarium calls not only for gum boots, but the hazard of dangerous slips into the slimy, spongy tundra.

At the same time the marshes are regal in iris bloom. So luxuriant is its growth throughout Alaska that it is being advocated for the Territorial flower. In shape it

is similar to the iris of California, grows to a height of two and a half feet, and the diameter of the flower is from four to five inches. It is very fragrant, and in color runs the gamut from deepest to palest purple and varied tints of yellow.

The climax of Nature's irony in the arctics is the cotton-plant. Wherever cotton blooms, declares the miner, ice is not far below. One may trudge for miles through fields of cotton, the white, silky tops swaying defiantly in the arctic breeze. The blossom is silky, dainty, illusive as the down of our own yellow dandelion on its way to seed. From June until late August the tundra is white with the cotton-plant. Unlike the cotton of the Southern States, the fiber is short and soft, having more of the texture of silk than of cotton. The cotton-plant will, in all probability some day be the means of developing an Alaskan industry giving employment to thousands. To-day, however, the cotton-fields are purely decorative—a splendid sweep of immaculate bloom in a bleak, timberless landscape guarded by hills ever hung in veils of deepest purple. In great bouquets it is occasionally met in a miner's shack, while not a few housewives gather the cotton for pillow-filling.

Throughout the cotton-fields flowers bloom in abnormal splendor, as becomes a country in which the sun shines continuously during summer's voluptuous reign. It is an intoxicating joy for the flower-hunter to gather great armfuls of purple larkspur, bluebells, monk's-hood, primroses, sweet peas, beautiful purple and red asters large as the most cultivated, lilies of the valley, baby-breath, yellow arrow, sage-rose, pink and white strawflower, gentians of many hues, arctic geranium, crimson rhododendrons, and giant fireweed, all growing on the hillsides—to enumerate further is to reproduce a florist's catalog!

Never have I seen forget-me-nots like unto those of the arctics. With stems the length of American Beauty roses, their pastel coloring of baby blue and sea-shell pink recalls the skill of French millinery rather than nature in its perfection.

Often the sun beats down fiercely on the flower-gatherer, and clouds of mosquitoes of abnormal growth threaten to force one to retreat, when suddenly from over the tops of the purple-veiled hills sweeps an icy breath—a veritable blast from the north pole, to which the flowers bid defiance, but before which the mosquitoes magically vanish.

The one inharmonious break in the solitude of an arctic flower-hunt—the one recall to civilization—is the occasional chortle of the "chesty" little logging-engine of the Nome-Arctic Railroad, which crosses the tundra from Nome on its way to the Kougarok country, to which it has just laboriously gained access. Its ribbon of steel, like the inflated yellow canvas pipe which brings Nome's water-supply from Moonlight Springs—a natural geyser in the heart of the mountains—is a compass for the chechako, the tenderfoot. To stumble upon a leak in a Moonlight Spring pipe and slake one's thirst in the good old primitive way is not unlike encountering an oasis in a desert. For mining, drinking, or domestic use, water is one of the Northland's scarcest commodities, a positive luxury, which retails at twenty-five cents a five-gallon can.

Moving flower-gardens are the Nome-Arctic freight-cars as evening brings back to Nome the track-laborers, miners, hewers of wood and carriers of water, with an occasional tourist. Every man, from boss to super, has a

basket or tin can filled with wild flowers, plucked by the stem or uprooted with the soil for transplanting.

In August, when blue and salmonberries ripen in the reindeer-moss, Eskimos are everywhere with sealskin leather pails, their gay-colored parkas, the hood with wolverene fur border, adding a picturesque color-note to the chiaroscuro. The arctic blueberry is richer, more delicious than its kindred of the States, while the salmon-berry is an esthetic delight as it lifts its royal yellow fruition from a bed of autumnal-tinted leaves of wax-like texture. American housewives combine the blue and salmon-berry into a delicious preserve. The natives bury them in the ground, marking the place with a cover of willows. There they freeze, and are taken out as needed, and eaten with seal-oil!

There is no subsoil in Nome. It has to be made from beach sand and tundra decay. Pathetic are the attempts to grow flowers or vegetables, but where there are women there will be flowers. Nome has scarcely a cabin or shack without some pretense to a window-garden. They are generally set outside and raised from the ground to escape contact with ice beneath or the malamutes (the sledge dogs), which prowl about in summer. At a mid-summer meeting of the camp's woman's club—the Ke-goayah Kozga owns its own club-house—the tea-table was radiant with pansies and mignonette raised from seeds in three weeks, while the walls were banked with the purple larkspur and monk's-hood of the tundra.

On the shore of Bering Sea, I was wont to linger in awe and wonder before a cabin whose large many-paned window was literally covered with nasturtium-vines in gorgeous bloom.

"Four weeks ago," said the Norwegian mistress in proud, broken English, "I planted the seeds in the tin cans you can't see today for the bloom."

Unique was the garden encountered at Chenik on Golofnin Bay, eighty miles from Nome. A native skin boat had been drawn up on the bleak beach, filled with sand and tundra soil, and covered with window-glass. There Molly Dexter, the Peninsula's most famous and beloved Eskimo, raised from seed, not only flowers, but radishes, lettuce, and celery for the road-house over which she presides as English-speaking landlady and unrivaled Eskimo cook.

Forging into the interior, down Solomon, Fox, Fish, or Neukluk Rivers, with every hillside ablaze in giant fire-weed and crimson rhododendrons, into the land of fir and cedars where shacks of canvas, tarpaper, or drift-wood give way to picturesque log cabins, the eye revels in roof gardens. Rare is the cabin whose roof is not covered with floral and vegetable growth.

I have seen many a miner thrust his hand out of the cabin window or door and pluck from his roof-garden radishes, lettuce, or onions for the morning or evening meal, while the flowers peep in window or door.

The demise of arctic bloom is as sudden and complete as its birth. There is no Indian summer, no autumn as we know it. Long before the last boat has left the road-

stead for the States, and the ice has begun to gather in Bering Sea, not a trace, not a hint of Flora's coquetry is to be found in all Jack Frost's kingdom.—Circle.

THE GREAT BUSINESS OF DISSIPATION.

Dissipation has been reduced to a system by men who have been reaping harvests of wealth therefrom. Evil may be systematized the same as good. It is astonishing that any government under the sun with force enough to maintain itself, and moral sense enough to lay claim to guarding the welfare of its subjects, should permit wholesale destruction of human health, and morals, and life. Yet the Christian nations are purloined by men whose power is sufficient to defy the forces of government. The liquor traffic constitutes one of the most formidable businesses of dissipation. It resolves itself into a giant trust, a confederacy of great distilleries whose aggregate gross income rivals that of great legitimate industries. Great fortunes are amassed at the expense of the lives of hundreds of thousands of victims. But the liquor business is but one of the many forms of destruction. In the East the opium industry assumes enormous proportions; and in both East and West, tobacco is consumed by the millions. Widespread and alarming are the forms of sex dissipation, and the wanton practice of gluttony. And coördinating all other forms of dissipation, is the mental dissipation afforded through the perusal of light literature,

Cotton Fields in the Arctic Regions

which is not helpful, but destructive to the mental powers. The great business of dissipation thrives today because the world is degenerate and low in the scales of morals and common sense.

HOW WAS HE?

"THOMAS," said the health seeker, "I am not well, but I am better that I was when I was worse that I am now."

Echoes from Everywhere

ECONOMIC.

Record-breaking shipments of American agricultural machinery were made recently when six big steamships were chartered to carry all kinds of farm machinery to Europe. \$25,000,000 was the total shipment, some of which goes into the heart of Siberia.

The United States leads the world in this class of goods, which fact is made possible by the high price and high tariff at home. Some of this machinery will be transported across the Atlantic Ocean and 6,000 miles inland to Siberia and laid down there cheaper than it could be bought for here.

The annual meeting of the Maine Daily Publishers' Association resolved that the ruling of the postoffice department requiring subscriptions in arrears of payment to be cut off, after a stated period from second-class rates, is one calculated to work great hardship upon the dailies and weeklies of Maine. Under this ruling dailies can extend credit to subscribers for only three months, and weeklies for only one year. We feel that this ruling in effect, establishes a national censorship of the press; that it is an unwarranted invasion of the private rights of both publishers and subscribers, and that its enforcement by the department will occasion serious loss to the publishers of daily and weekly papers in Maine.

From every quarter of New England comes the news that thousands of idle workmen found employment in the hundreds of factories which resumed work after the holidays.

State's Attorney Wineman has a new scheme for keeping tab on liquor shipped into North Dakota, with a view to bringing about the arrest and conviction of those engaged in illegal sales. It is to pass a law establishing a system of inspection similar to that governing oil shipments into the state. He would have every package shipped into the state branded as to its purity, and a fee charged for the inspection sufficient to make the system self-sustaining. To sell any package without the inspector's brand would be a misdemeanor. Eight towns are suggested as ports of entry, at each of which there would be a deputy inspector. After such inspection, the law would require them to notify the State's Attorney of the various counties into which the liquor was to come, so that they could keep close watch of the business.

The proposed deepening the channel of the Mississippi to Minneapolis will require a change in the dams built between that city and St. Paul by the Government. These dams were planned to provide for a 4½-foot channel. It is now proposed to make a 6-foot channel. The loss will be about \$1,500,000.

The Shaw Hose Company, of Lowell, Mass., is building a model boarding house for its employes. The building is to be heated by steam, lighted by electricity and in a large dining room, capable of seating three hundred and fifty persons, dinners will be served for all employes who desire to patronize the enterprise. It is much better for employes to have a hot dinner than to dine out of a dinner pail. Corporations with souls are becoming plentiful.

The Colorado women, unabashed by the common sentiment that politics are not nice enough for women, announce that one of the delegates at large from their state to the Democratic National Convention must be a woman.

No one would deny that Mr. Taft has diplomatic ability. When a youthful newspaper correspondent asked him in Russia whether he would accept the nomination for the presidency, he answered,—Yankee-wise: "Young man, are you authorized to offer me the nomination?"

Minneapolis is the last large city to join in the fight against the saloons. A concerted movement of religious societies and temperance leaders head the movement. The city will be none the worse nor poorer if the saloons are annihilated.

The National Council of Commerce, starting with thirty-odd organizations of business men in the large cities and expected ultimately to embrace practically all of the leading commercial bodies in the country, was formally launched at a conference in the office of Secretary of Commerce and Labor Straus recently, the delegates having been called together by Secretary Straus to promote closer association between the department and the commercial bodies of the United States.

Gustav H. Schwab, of New York, was made chairman. A scheme of organization presented by Mr. Straus was adopted. This prescribes that the council's functions shall be to keep the Department of Commerce and Labor informed of the needs and desires of the business world and to keep the business community informed regarding the work of the department. The organization will consist of two closely connected yet distinct bodies, viz.: A National Council of Commerce and an Advisory Committee, each to elect its own officers and establish its own rules of procedure. The National Council will act on reports of the Advisory Committee and on measures proposed by delegates from the various organizations and will formulate suggestions to promote commerce.

GENERAL.

Last week two pigeons flew from Minneapolis to Boston in less than five days—a distance of 1,200 miles. Counting out darkness and feeding time they averaged nearly thirty miles an hour.

A curious old law was revived in New Jersey last week, when a man named Pfeiffer and his daughter were indicted on the charge of being common scolds. The neighbors objected to the disagreeable remarks the two leveled at each other. The penalty for the misdemeanor runs up to \$1,000 fine, or three years' imprisonment, or both.

The giver of the new \$50,000 Young Men's Christian Association building, at Fort Slocum, is, it has been learned, none other than Mrs. Russel Sage. Mrs. Sage recently increased a gift of \$50,000 she had made to erect a building for the railroad men, at Long Island City, to \$85,000, and also her gift to double the capacity of the Naval Branch, Brooklyn, from \$250,000 to \$340,000. A building is being erected, which is the gift of Mrs. Sage, for the international headquarters of the Young Men's Christian Association movement at Twenty-eighth Street, at a cost of \$350,000. The site was given by Mrs. William E. Dodge. Mrs. Sage has also added \$25,000 to provide for an addition to the soldier's clubhouse, which is directed by the association at Fort McKinley, Philippine Islands, and \$20,000 toward a building for the Association at St. Paul, Minn. Her donations to charity do not seem to be advertised as loudly as does Mr. Carnegie's or Rockefeller's. We are near the point where it takes millions of money to acquire the title of "benefactor." Some people who devote an entire life to charity are not recognized as much as those who give only their money.

The cry of "prosperity" which is accompanied universally by the tremendous increase in the cost of living reminds one of the story in which a pious clergyman was illustrating to his son some of the beauties of nature and the wisdom of an all-wise Providence in equipping every living creature with the means of securing its own livelihood. "Take the crane," said he; "its long legs were given so that it could wade in the water in search of food; and see how useful its long bill is in picking up frogs." "That's all very well," replied the observing youngster, "but it seems to me it is rather tough on the frogs."

Finland's example is spreading. Six bills to give women full suffrage are now pending in the Norwegian Parliament. The women of Norway have had the municipal ballot since 1901.

The lives of the two men between whom the peace prize was divided offer a great contrast. The Frenchman, Louis Renault, has had a most humdrum life of patient work as a professor of international law, recognized by the world's rulers, but hardly heard of by the people whom he has profited. He has, all along, been the working member of the delegation of France at the Peace Conference of The Hague, and at other congresses, when he had conducted the legal battle of the French ministry of foreign affairs. At the Peace Conference of the present year, he was the author of the agreement for an international prize court. Among his many books, he has written a notable "Introduction to the Study of International Law." Moneta, the other prize winner, is an Italian, seventy-four years old, and for much of his life has been a fighter in one cause or another. He began fighting at fifteen, in 1848, against the Austrian rulers of his native city of Milan. When the fight failed, the boy

entered the Piedmont military school, and then, after a dozen years of soldiering, enlisted under Garibaldi for his wild Expedition of the Thousand. With his reckless leader, he climbed up and tumbled down the mountain, which the king's soldiers thought impassible, and so left unguarded—and conquered Palermo. As a result, Moneta received his first peace work, and was given the task of pacifying the island. After seven years of further service in the army, he became editor of the Milan "Secolo," a paper which existed only to combat, but after nearly twenty years, when Italy had taken her place among the nations, he felt that fighting was no longer necessary. Then he led in the foundation of the Lombard Union for Peace, and of a peace journal with contributors among all the leading peace agitators of Europe. Finally, he put all his eloquence and sympathies into a book, "War, Insurrection and Peace in the Nineteenth Century," which won for him the peace prize.

The American Banker's Association, representing 12,000 bankers, have formally issued a protest against this currency reform which is being discussed in Congress. While all classes of people agree that our currency system needs revision it will be hard to get any one system that will suit Wall Street, the business man, and the producer of crops. The solutions already offered are too intricate to analyze, but before Congress adjourns we may expect some new monetary legislation either for the better or for the worse.

Rio Janeiro, Jan. 20.—An anarchist plot to blow up the sixteen battleships of the American fleet has been discovered. The first rumor was that Japanese would make the attempt, but other foreign anarchists seem to have figured prominently in the affair also. The local detective force made the discovery and the perpetrators of the plot all fled to the interior where they will be hunted down. This accounts for the many French rumors that Japan was waiting for a chance at Uncle Sam's throat.

Chicago, Ill., Jan. 20.—After a nine weeks' trial John R. Walsh was found guilty of wrecking several Chicago banks by heavy speculation in various enterprises. The case will be appealed, since the case involves many of the prerogatives of bank presidents.

WANT AND EXCHANGE

To accommodate some of our readers and bring them in closer touch with each other, we have opened this "want and exchange" column.

Rates, twenty-five cents per insertion, not exceeding four lines, including name and address. Five cents per line for additional lines. However, no "want" may exceed six lines altogether.

FOR SALE.—One acre in small burg; 7 room house with cellar, stable and outbuildings, all nearly new. Water, fruits, well fenced. Fine for teacher. G. B. church 1¼ mile. Price, \$1,000.—H. H. Helman, Sidney, Ohio, R. 6.

WANTED.—To enlarge, or copy, pictures for Inglenook readers. Send me any of your favorite pictures and I will make you a 16 in. x 20 in. picture exactly like the original for \$1.50.—W. J. King, West Lafayette, Ohio.

WANTED.—Inglenook readers having money that is earning less than ten per cent to buy one or more of my Texas ten acre tracts at \$200 each and rent same back to me for cash. I will pay \$2.25 an acre rent for 1908 for lands bought of me before February 20. See my advertisement.—H. J. Burdick, Elgin, Illinois.

NEFF'S CORNER

I have just had a two-room house built here—such a property as I offer for \$305.00, and before the house was half completed I rented it for \$8.00 per month, receiving cash for a month's rent in advance. That is a little better than 27 per cent on the investment. If such an income as that would interest you, write to

PROBLEMS of PULPIT and PLATFORM

By D. D. Culler

In this book the author discusses some of the most important problems of public speaking. A few of the subjects discussed are:

Forecast for Public Speaking.
The Speaker as Blood and Brawn.
The Voice in Public Speaking.
The Audience.
The Discourse.
Style in Discourse, etc., etc.

The book will be found very helpful to all public speakers or any one interested in this line of work.

TEXAS TEN ACRE TRACTS

at \$200 each pay ten per cent net cash rental in advance annually and big increase in value.

I have subdivided into ten acre tracts a piece of rich farming and fruit land located near a good "dry" town in one of the best rain belt counties of Texas. This land grows cotton, corn, sugarcane, peanuts, tobacco, sweet and white potatoes, early tomatoes, other vegetables, and nearly every kind of berry. Set to peaches or figs this land would be valued at \$200 and upwards per acre. I am selling my ten acre tracts on a net ten per cent in advance investment basis at \$200 each and renting them back from the buyer for farming purposes at \$20 each cash in advance a year. I pay taxes, too.

You know this must be good land or I could not afford to pay big rent for it.

I know it is good land or I could not afford to sell it to you at any price. It is a fair, square proposition. You buy my land and pay for it. I rent it back from you and pay \$2 an acre cash rent. I want to sell out this subdivision and rent it back so as to begin farming soon as possible. To facilitate this I will pay \$2.25 an acre rent for all land in this subdivision bought and leased back to me up to February 20, provided all land is not sold before that date. Don't you want several of these Ten Acre Tracts? Deposit with your bank or express agent \$50 for each ten acres wanted and notify me. I will send you contract for the land, also a lease of it to me for you to sign. Deeds will be ready as soon as subdivision is sold and leases executed. This should not be later than March 1. Your rent will be paid at time deed is passed. Titles absolutely good.

H. J. BURDICK, - Elgin, Illinois.

Is this your picture Mother, Sister? Is your Nervous System broken down and you can hardly drag along? Brawntawns, The Victor Tonic, was made for you as it builds broken down systems, restores appetites, strengthens the digestive organs. If you have tried other tonics don't despair until you try Brawntawns, The Victor Tonic, for it will build you. Thirty days' treatment delivered to your home for 50c.

Ropp's New Commercial Calculator and Short Cut Arithmetic The Standard for Store, Farm, Bank or Factory,

5 1/4 x 2 3/4 in.

Is from beginning to end a greatly improved, enlarged and thoroughly revised publication.

It contains an entirely new system of unique Tables, Short-Cuts and up-to-date Methods.

It is unquestionably the most complete, useful and comprehensive Calculator ever published.

It has more than twice the matter, scope and capacity of Ropp's former editions, of which

Nearly 1,500,000 Copies have been Sold.

It is the most convenient and practical Labor-saving work ever used in the business world.

It will make every one independent, sure and self-reliant in all practical calculations.

It will prevent mistakes, relieve the mind, save time and labor, and often loss and trouble.

Its Tables are adapted to all the trades and occupations in the city and country, and

Show the Answer as Quickly as a Watch Shows the Time.

It also explains and simplifies the principles of Arithmetic, Mechanics and Mensuration.

It will make the study and use of Figures easy and interesting for young and old.

It will enable every progressive mind to become an expert, sure and rapid calculator.

It will prove a boon to all whose education in arithmetic has been limited or neglected.

48 Cuts Illustrate the Elements of Mechanics and Mensuration

It defines about 70 points in "Commercial Law" which every man and woman should know.

It is the result of devising, and improving system after system; of spending thousands of dollars in experimenting; of making millions of miscellaneous calculations, and of doing some vigorous thinking during 38 years, by an analytic, practical and persevering mind.

It is Especially Designed for

Farmers, Mechanics, Business and Professional men,

LOMITA, CALIFORNIA

1. Situated four miles from the ocean, and near San Pedro Harbor. Rich soil, excellent natural drainage. Can grow crops 12 months in the year.

2. Three wells of soft water for irrigation and domestic purposes. Water piped to each one's land. Settlers to own all water systems.

3. Natural gas comes up with water, and is used in engine to pump the water, making the expense of lifting quite nominal. Gas leaves the water on reaching the air, hence pure water.

4. Markets at the front door and back door; land and water transportation to all the world.

5. Grain and corn raised without irrigation. Crops from October to May, barley, oats, wheat, onions, cabbage, beets, peas, cauliflower, radishes, citrus and deciduous fruits, nuts, and vegetables in their seasons. Government analysis of soils shows much of this land very fine for oranges and lemons.

6. Six lots donated for German Baptist Brethren church. Good opening for business. No saloons, no pool rooms can be operated on these lands.

7. All kinds of produce bring good prices, at San Pedro Harbor and Los Angeles. Profits from \$100. to \$500 per acre per year. Settlers arriving right along. This colony sure of success, as it has the soil, the water, markets, the push and a twelve months' climate to grow useful things.

Olive Branch of Peace

Valuable Contribution.

Dear Brother Hays: I have ordered a copy of your book, "The Olive Branch," and have read it with exceeding interest. It is a valuable piece of contribution, not only to the history of the Valley of Virginia, but also to the history of the Brethren Church and other peace loving societies of God's people. Especially is it valuable as a clear and full statement to the world of what the world is coming more and more to recognize as just, reasonable, and desirable—Peace, and the spirit of Christian peace. I pray and believe that by means of this book, "The fruit of righteousness is sown in peace of them that make peace."

Yours fraternally,

John W. Wayland.

University of Virginia, Charlottesville, Va., Oct. 29, 1907.

This book contains 232 pages, has a number of illustrations and is well bound in cloth.

Price prepaid,75 cents

ALBERTA

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the Brethren already there and enjoy some of the material benefits as well as help build up one of the largest Brethren Colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

ROGUE RIVER VALLEY OREGON

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

Be sure to buy your ticket over

The Union Pacific Railroad

known as the **Overland Route**, and is the only direct line from Chicago and the Missouri River to all principal points West. Business men and others can save many hours via this line.

- ☐ You can enhance the value of your own property.
- ☐ Real estate raises a living even in a panic.
- ☐ Make up your mind to own a good home, and act NOW.

## SAY--Did you read

What John A. Carroll said in the  
**RECORD-HERALD** of January 19?  
Here is a little of it. Hunt the rest.

### ONCE HOME OWNERS' NATION.

Time was, when America was a nation of home owners. Whether fate decreed that a man dwell with his family in the city, village or country, it usually decreed that he live under his own roof. With the advent of the era of speculation, a new condition developed. Instead of putting the accumulated savings or earnings into a home, which was the first ambition of our fathers, we have turned to the financial sheet of the daily paper, or listened to the persuasive voice of the promoter, and bought stocks, i. e., have been persuaded that in large cities it is cheaper to rent than to own a home.

The sons of the farm have been drawn into the maelstrom of city life, and there has been a general tendency by Americans to abandon the soil—an un-American system of feudalism has developed, and instead of being a nation of home owners, with all the sublime significance which the term implies, we are fast becoming a nation of 3 per cent savings depositors. If encouragement could be given to the individual buying and owning of real estate by Americans, it would make for the betterment of the country. While Americans have been exploiting in stocks and bonds, foreigners have been buying real estate. Having been denied the privilege of ownership in their own country, they have been ready and eager to grasp the opportunities of individual ownership afforded in America, and the result is that most of the operations in real estate have been and are being done by those who were born across the sea. A visit to the tax collector's office, when taxes are due, will demonstrate that these people are the home owners, and the hotel registers will disclose the American speculative classes.

If real estate had been preached and written and staged, and given one-half the attention its importance deserved and demanded, and the millions of dollars which have been deposited in savings banks or passed over the counters of stock brokers had been invested in real estate, there would be fewer colossal trusts and fewer shattered hopes. While we read or hear very little of the fortunes made in real estate, still the fact is that real estate is the foundation of more substantial fortunes than all the other enterprises and industries combined.

The term "romance," however, has no place in the discussion of real estate. There is nothing in the sound of the word which suggests anything but solidity and stability, and yet has ever a more interesting history been written than that bound up in the musty pages in the ordinary R. E.? Abstracts of title tracing it from the time when the ownership was vested in the government up through the successive chapters of its history, we find a consistent story of never-failing interest, and with a "finis" never disappointing.

### AN ECONOMIC QUESTION.

The question of individual home ownership is more than a mere economic one. It has a deeply significant ethical side. Philosophers and observers deploring the recent tendency on the part of Americans to abandon the soil, and the increasing tendency to speculate have sounded the alarm. They see the certain effect which this condition will produce on the body politic. If the breach between the masses and the classes is not to be widened we must check the growth of feudalism and encourage the vigorous and independent spirit of our forefathers.

Governor Hogg, of Texas, the sturdy advocate of individual home ownership, says: "Home is the center of civilization—the pivot of constitutional government; it is the ark of safety to happiness, virtue and Christianity. Home is the haven of rest in old age, where the higher elements of better manhood can be taught rising generations. Every man should own a home."

# Possibilities of IDAHO

## Unlimited

Many Brethren are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for Brethren and others of small means to get good comfortable homes with a splendid income.

### Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

### Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

### Realize \$1,000.00 Per Acre

#### Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

#### Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

## THE RED CROSS

By CHARLES L. MAGER, Secretary of the American National Red Cross

THERE is no organization in the world, perhaps, so widely known as the Red Cross, for every civilized nation, even China, Japan, and Turkey, has its Red Cross Society, and in one of these three countries named is found the greatest one of all, in size and efficiency—the marvelous Japanese organization with its million and a half members, each paying in dues the equivalent of \$1.50 a year. An Endowment Fund of two and a half millions, hospital ships, hospital trains, hospitals, training schools for nurses and a trained personnel equip to perfection this great machine whose sole purpose of existence is the prevention and relief of suffering. The American military and naval attachés who were with the Japanese forces during the late war in the Far East speak in the highest praise of the wonderful efficiency of the Red Cross in caring for the sick and wounded in camps and on the many battle fields where tens of thousands lay helpless, dependent upon this volunteer organization for medical and surgical treatment; for be it remembered that there never has been and never can be carried in time of peace, by any government, a regular Medical Service sufficient in numbers to meet the extraordinary requirements of war.

The reader should not, however, conclude from the foregoing that Japan has the only great and efficient Red Cross, nor even that she is very far ahead of the other great powers of the world in this respect. Germany, France, Austria-Hungary, Italy, Spain, Bulgaria, England, all have Societies whose members are counted in hundreds of thousands and whose resources in money, property and supplies are valued at millions.

On account of limited space only a very brief description can be given of the foreign Red Cross Societies. The British Red Cross, which works only for war relief, has recently been reorganized at the special request of the King who is its patron, Queen Alexandra being its President, and Lord Rothschild, the Chairman of the Council. It has an army nurse re-

serve department and a trained personnel for relief columns for the transportation of wounded. The Rus-

Hon. W. H. Taft, Secretary of War, President of the American Red Cross.

sian Red Cross owns and supports a number of large hospitals where its lay-sisterhoods of nurses receive their training. Reports published before the war with Japan showed funds of over six million dollars. The Society rendered invaluable service during the late war in providing several thousand trained nurses, surgeons, field hospitals, and fifteen of the thirty trains that were used for the transportation of the sick and wounded from Manchuria back to Russia. The funds of the French Red Cross and the value of supplies it possesses amount to nearly two and a half million dollars and it has a membership of over fifty thousand and an annual income of seventy thousand dollars besides the interest on its funds. It has equipment for eighty-eight railroad station infirmaries, twenty-six field hospitals and other hospitals providing total accommodations for about twenty thousand patients. It has a personnel of eight hundred and six surgeons and eight training schools for nurses. In Germany the Red Cross Societies of the different States have a total membership of over three hundred thousand and

Italian Red Cross has funds and supplies valued at about a million and a half dollars. It has five hundred branches, equipment and personnel for eight war hospitals, each having a capacity of one hundred and fifty patients, fifty-four mountain ambulance corps, thirteen hospital trains for two hundred patients each, and one with a capacity of one hundred; forty-four railroad station infirmaries, one river hospital, and one ship hospital, each with accommodations for two hundred and fifty sick or wounded.

Let us now return for a moment from the wonderfully efficient organizations of today to the very origin of this greatest of all humanitarian movements.

On June 24, 1859, was fought the bloody battle of Solferino. A Swiss, M. Henri Dunant, was a witness of the terrible and preventable sufferings of the thousands of wounded. Actuated by the humane desire to minimize, so far as possible, such horrors of war, M. Dunant concluded that it would be necessary, first, to provide by international treaty for the protection of all formations and equipment for the care of sick and

Scenes in the Famine District of China in 1902, Relieved by the American Red Cross.

have equipment for the care of some forty thousand sick and wounded. They have thirteen hundred medical officers, eight hundred and six sanitary transport columns, with a trained personnel of twenty-two thousand men. The Austrian Red Cross funds and value of supplies aggregate nearly two and a half million dollars. It has hospital accommodations for thirty thousand sick and wounded, equipment and personnel for two field hospitals with a capacity of two hundred patients each, thirty-three transport columns, having fifteen ambulances each, besides aid stations, reserve hospitals, warehouses, and a hospital ship. It has a personnel consisting of seven hundred and twenty-three surgeons, twenty-five pharmacists and nine hundred nurses. It has over fifty thousand members, and the Hungarian Red Cross, which is a somewhat separate organization, has over forty thousand members. The

wounded, the neutrality of the personnel of the same, and the immunity from confiscation of hospital supplies; and second, to organize officially authorized voluntary relief societies to render supplementary aid to the medical departments of armies in time of war. In order to arouse public interest M. Dunant recorded his experiences in a pamphlet entitled "Un Souvenir de Solferino," and in 1863 a preliminary conference composed of a number of representatives of various nations was held at Geneva to consider the best method to bring about the desired results. In 1864, by invitation of the Swiss Government a convention was held at Geneva and the Treaty of Geneva, or Red Cross Treaty, as it is generally known, was drafted and signed by eleven of the European powers. Since then this Treaty has been accepted by all the European Countries, the United States of America, Persia, Japan,

China, Siam, Mexico, and a number of South American States. This Treaty, which was revised by a second conference at Geneva, in 1906, at which thirty-six nations were represented, provides for the protection of the sanitary or hospital formations, for the immunity from capture of their personnel, and against the confiscation of hospital supplies. The Treaty provides also for a distinctive emblem. In homage to Switzerland, the flag of that country, with a reversal of its colors, was adopted, the insignia being a Red Cross upon a white ground, the proportions of the cross to be those of five equal squares of any convenient dimension, arranged in the form of a cross.

Though primarily the Red Cross organizations, created as a result of this treaty, were organized solely for the relief of sick and wounded in war, and though a number of them still limit their sphere of activity to this original purpose, the majority of the Red Cross Societies have extended their scope of activities to include relief work at times of great disaster,

the South Sea Island Hurricane and the Armenian massacres, but it remained always a limited organization as to membership and at the time of its reincorporation and reorganization in 1905 had not more than three hundred members.

Congress, realizing the inefficiency of our Red Cross because of its limited size and its lack of proper organization and business methods, in June, 1900, repealed the existing Charter and granted a new one. Shortly after this reincorporation relief work was undertaken by the Society for the victims of the Galveston inundation, but the Society received only a small part of the large amount of money contributed for this relief, which seemed to indicate that the Red Cross did not possess the confidence of the public. Therefore, in January, 1905, Congress again repealed the Charter and granted a new one which in its preamble states "It is believed that the importance of the work demands a repeal of the present Charter and a reincorporation under Government supervision." It is under

Cottages Erected in San Francisco by the American Red Cross for the Protection of the Earthquake and Fire Victims.

epidemics, etc. in time of peace. The Societies which are best fitted to render such relief will be best prepared to provide in time of war the trained and systematic volunteer aid to the medical services of their armies and navies for which they were originally organized.

This brings us to the Red Cross of our own country, with whose history, I regret to say, few of our people are familiar.

An American Association of the Red Cross, of which Miss Clara Barton was President, was formed in 1881, but it was not until March, 1882, that the United States signed the Treaty of Geneva. This Association was later incorporated as the American National Red Cross in 1893, and rendered aid at the time of various calamities such as the Mississippi and Ohio River floods, the Johnstown disaster, the Russian famine,

this new Charter that the Society is at present carrying on its operations. This Charter provides for an annual report to Congress by the Society and the auditing of its accounts annually by the War Department. The Charter also provides that the governing body shall be a central Committee of eighteen members, six of whom, including the Chairman, to be appointed annually by the President of the United States and that five of the Presidential appointments shall be comprised of representatives of the following Executive Departments: State Department, Treasury Department, War Department, Navy Department and Department of Justice. The twelve other members of the Central Committee are elected by the Board of Incorporators and delegates from the State and Territorial Branches. One duty of the Society as specified in the Charter is

to organize with as little delay as possible State and Territorial Branches. This requirement of the Charter has at this writing been accomplished in the following States, Territories and possessions: California, Colorado, Connecticut, Delaware, District of Columbia, Georgia, Hawaii, Illinois, Indiana, Iowa, Kansas, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oklahoma, Pennsylvania, Philippine Islands, Porto Rico, Rhode Island, South Carolina, Texas, Vermont, Washington, West Virginia and Wyoming.

Since the reorganization of the American National Red Cross in January, 1905, the following amounts have been received by it from contributors throughout the country to be applied in the relief of suffering incident to the following disasters and famines: Philippine Typhoon, \$1,150; Japanese Famine, \$265,000;

bership presented to us? Any citizen of the United States by application and the payment of one dollar annual dues may become a member of the American National Red Cross. These dues, excepting such portion as is required for administrative expenses, go into the National Emergency Fund which is used only for the relief of suffering.

There is still another phase of Red Cross work—a new field—of which I wish to say a word, and that is the anti-tuberculosis campaign—the battle against the “great white plague.” The necessity for this work is, alas, only too evident to many of us in this country, where one hundred and fifty thousand lives each year are lost as a result of the ravages of this great pestilence. This is a new field of effort for the Red Cross and will be taken up in coöperation with the National Association for the Study and Prevention of Tuberculosis. The little Red Cross “Merry Christmas stamp”

A Red Cross Hospital Boat Giving a Summer Outing to Sick People of Boston.

Vesuvian Disaster \$12,900.00; San Francisco Earthquake \$3,117,000.00; Valparaiso Earthquake \$12,400; Gulf Storm \$800; Russian Famine \$10,000; Chinese Famine, cash \$331,000, and supplies for the Chinese Famine sufferers valued at at least \$150,000. A grand total of \$3,900,250. This large amount which has in less than three years been entrusted to the Red Cross for administration proves conclusively the confidence the Society at present enjoys in the minds of the people, but why is it that so few have identified themselves with this great benevolent organization by becoming members? What qualities that make for humanity and charity do the people of other countries possess that we do not? Are we less patriotic or generous or charitable, or is it that we have never before had the existence of the Society and the necessity for a large mem-

that has in the past few weeks graced hundreds of thousands of Christmas letters and packages was devised as a means of procuring funds for the anti-tuberculosis work and next December will again be placed on sale at a penny each in every section of the country.

It should be the ambition of the United States to have its Red Cross the equal of any in the world, with a million members and funds that will enable it to render immediate relief at times of disaster or epidemic. The dues of only one dollar a year bring its membership within the reach of all, and the principle for which the Society stands—humanity and patriotism—must appeal to everyone who recognizes the brotherhood of mankind and the love of country. Upon the support of the individuals of this nation will depend the efficiency of the American Red Cross.

# “The Old Oregon Trail and the Ox Team Monumental Trip”

A. K. Graybill

THE perusal of a book on the above subject having proved of very much interest to me, I think that a write-up of the most important information contained therein, should prove of interest to the readers of the INGLENOOK. The author of this book, Mr. Ezra G. Meeker, many of our readers will no doubt have either seen or heard of as he passed across the country on his three thousand mile journey to the National Capital recently in a vehicle.

Western Nebraska and Eastern Wyoming, passing old Ft. Laramie, Douglas and Casper; then up the valley of the Sweetwater to the South Pass of the Rocky Mountains, across the Green River Valley to Soda Springs, Idaho; then passing north of the great bend of the Bear River (where the California trail turned off to the south) past Pocatello, Idaho; then following what is now the route of the Oregon Short Line R. R. to about Huntington, Oregon, with the exception that

Continental Divide over which Oregon Trail Passed.

One of the eastern ends of the trail was at Independence, Mo., though the journey really began at St. Louis,—men and goods going up the Missouri River to Independence. The Oregon and the Santa Fe trails followed the same route for forty-one miles to about where Lawrence, Kans. is now located. Here the Oregon trail turned northwest and formed a junction with the other trail which began at Omaha, Nebr. The trail then followed the Platte River to North Platte, Nebr., then along the North Platte River, then

it bent far enough north to pass Boise, Idaho. It crossed the Blue Mountains past Baker City, Oregon, and came to the Columbia at The Dalles, Ore., where the main trail ended, for from here, they floated down the Columbia.

In naming these towns along the trail it must not be supposed that any of them were located there then, for, with the exception of Ft. Laramie on the North Platte and Ft. Boise at the lower crossing of Snake River, the country was an unbroken plain and desert.

As to the actual making of the trail, where the country has been developed, it has been entirely obliterated, but in the high desert waste country, it may yet be seen worn fifty feet wide and seven feet deep, and at other places as much as fifteen feet deep and one hundred feet wide.

Who blazed and followed this historic highway? "The Frenchman De la Verendrye was perhaps the first to tread a portion of the later Oregon trail; since it is known that he forsook the Missouri River and started overland, possibly up the Platte, crossing some of the country which the Astorians saw later. This was in 1742. The trapper Ezekiel Williams, said to have been the first white man to cross the borders of

of the Platte. Eight years later, Fort Bridger was built by Jim Bridger, on a branch of the Green River."

"In 1836 two women moved out into the West along the Oregon trail. They were the wives of Whitman and Spalding, missionaries bound for Oregon. Father de Smet, a missionary also, followed in 1840; then more missionaries from New England, and two years later Fremont, as far, at least, as the South Pass."

Then in 1843, a company nearly one thousand strong, under the leadership of Burnett, Applegate, Nesbitt, and Whitman, not only traversed the one thousand miles of explored route from the Missouri to old Fort Hall on the upper waters of the Snake, but they plunged out into an unexplored, trackless desert, threat-

Where the Oregon Trail Passed Above the Clouds.

what is now Wyoming, followed in the wake of Lewis and Clarke, in 1807, and blazed a part of the way. Andrew Henry, whose name was given to a beautiful lake in the Rockies: Etienne Provost, the probable discoverer of historic South Pass; Campbell, Fitzpatrick, Sublette, Jim Bridger, Gen. Ashley, Bonneville, and Walker; these are but a few of the leaders who blazed and trod the Oregon trail, making it a well defined highway before Fremont set out as a 'pathfinder.'"

"Then came Wilson Price Hunt, with his overland Astorians seeking a way from Missouri to the Columbia River. Later, Robert Stuart and the returning Astorians were to mark out, east of the Continental Divide, the route of the trail for much of its length. Then came scores of trappers and traders; then Bonneville and his wagons, to deepen the trail, in 1832; and two years later, in 1834, Campbell and Sublette built old Fort Laramie on Laramie Creek, a branch

ened by famine and the Indians, and watched, with suspicion by the out-posts of the Hudson Bay Company; they traveled the other eight hundred miles to the Oregon country. Then the following year, there was a crowd of fourteen hundred passed over this two thousand miles of desert. Increasing numbers crossed this dreary waste from year to year until the year 1857, when one could safely say that no such numbers had traveled so long a desert road since Moses led the two or three million Israelites on their forty years' wilderness journey from Egypt to the land of Canaan. In the year 1852 there were fifty thousand that made this trip.

The next question that will naturally arise is as to the make up of these expeditions—the sort of teams used, the style of wagon, and the organization of the parties. Their teams were largely oxen or oxen and cows mixed, though, in some cases they had mules or

horses. The wagon was of the old lynch-pin "prairie schooner" type, deriving its name from the fact that the wagon bed was shaped like a boat, and, in fact, was used in that capacity on many occasions.

Whitman's party of 1843 traveled as a completely organized company one thousand strong; others would have a small company of probably a half dozen families, and still others moved as entire separate families so far as their intercourse was concerned. The 1843 expedition always had a pilot to guide them by day and watchmen to protect them at night; a certain hour for rising, a time for starting, a well understood time for dinner, and a time for going into camp for the night. They always formed a complete corral at night for a protection for themselves and their teams. Every individual knew how to move at the sounding of the bugle or the firing of the gun.

The hardships that these people endured is the most striking thing about the whole movement. The crossing of the Missouri River is the first thing that presents itself to our attention. One can easily imagine the situation when we tell you that there were sixteen hundred teams at one time on the banks of that river, in the spring of 1852, to cross over and only two small scows to convey them across a swollen and turbulent stream, such as the Missouri is in the spring of the year at Omaha, Nebr. No small wonder that several persons and teams were lost. The Indians gave them a great deal of trouble also through their treachery and pilfering about the camps.

Then the dust caused by the passing of so much stock over this desert in the summer, was at times almost beyond the power of human endurance. Just try to imagine the situation, with the hot summer sun boiling down on thousands of people and cattle with the dust rising so thickly that one could not see their hand held out before them. Mr. Meeker says that while they were in camp four days with a sick brother, there were sixteen hundred wagons drawn by ten thousand beasts of burden accompanied by thirty thousand loose stock and eight thousand persons, passed by them.

The worst of all their hardships, though, was their sufferings from disease, especially the cholera. An insufficient quantity, a lack of variety, and poorly prepared food, brought on much sickness and death. One whole family of seven was entirely obliterated by cholera. In another instance there were forty-one fresh graves from a camp in two nights and one day; and at another place, fifty-three new graves.

Mr. Meeker says that in the summer of 1852 when he made this journey, the crowd was so great, that it took them a month to cross the Missouri River; and that the company stretched out along the trail for five hundred miles; and that, at a very conservative estimate, there were fifty thousand people. They used their wagon beds for boats in crossing some of the rivers, and they answered the purpose very well.

A great many of the people started with too much property, so when they got out on the plains and it became burdensome, they would abandon it. In many cases when a wheel or two of their wagons would give way, they would leave the entire outfit; so it was no trouble to replace almost any broken part about any one's outfit, as well as collect any sort of household furniture.

As this trail across this great unknown country was entirely outside the pale of civil law, one would naturally conclude that there was much lawlessness, but a certain writer has said that nothing could be farther from the truth, as any one criminally inclined, soon found out to their sorrow. "No general organization for law and order was effected, but the American instinct for fair play and for a hearing prevailed, so that while there was not mob law, the law of self-preservation asserted itself, and the mandates of the level-headed old men prevailed, a high court from which there was no appeal, but a high court in the most exalted sense; a senate composed of the ablest and most respected fathers of the emigration exercising both legislative and judicial power, and its laws and decisions proved equal and worthy of the high trust reposed in it." One case is mentioned, where a man with a family consisting of a wife and four children was found guilty of murder. A council of twelve men was called, and they deliberated two days, and the man was sentenced to death; not, however, until his family had been provided for.

Now, what about the second part of our subject? Mr. Ezra G. Meeker, one of the earliest permanent settlers in the "Sound" country of what is now Washington State, and whose home is at Puyallup, Wash. nine miles southeast of Tacoma and thirty miles south of Seattle, fixes up a wagon to resemble the old time "prairie schooner," one of the hubs being from an old wagon. He then purchases two steers from the stock-yards in Tacoma, and starts out to retrace the route he had passed over fifty-four years before. The first thought of many readers will likely be that he is surely a crank, but I assure you that if you were to see him, or to read one of his half-dozen books, you would decide that he was all right. He started on the 29th of Jan. 1905 and arrived in Washington, D. C. twenty-two months later, having traveled about three thousands miles.

As to what he accomplished on this journey, he camped at all the little, as well as the large towns, along the way, and wherever he could get a hearing, he spoke to the people and tried in every way to get them interested in erecting monuments to perpetuate the memory of those hardy pioneers that trod this long weary trail. He succeeded very well in this work, for he either erected or provided for the erection of twenty stone monuments of some sort at as many different places; then, besides, he planted a hundred posts along

the way. Some of the most important places marked in this way, being Centralia, Wash., Portland, The Dalles, and Baker City, Oregon, Boise and Pocatello, Idaho; Pacific Springs (South Pass), Casper, Douglas, and Fort Laramie, Wyoming; and North Platte, Nebr. The monument erection ending at Omaha, Nebr. Three thousand school children having contributed to this cause, as also women's clubs, men's clubs, boards of trade, etc., giving encouragement.

After finishing his memorial trip at Omaha, Mr. Meeker continued his trip across the central West to his boyhood home at Indianapolis, Ind. He camped and spoke in all the principal towns through which he passed, and sold quite a number of his books, and, also, a lot of post cards. He spent two months in Indianapolis, then started for New York, going by way of Columbus, Canton, and Cleveland, Ohio, and Buffalo, N. Y. After spending three months in New York City, he continued his campaign of education through Phila., Pa. and Balto., Md., and then on to Washington, D. C. where he is now located, or, at least, his team is here, but he is making a month's visit to his home. He expects to spend a few more weeks here, then he will ship his team to St. Louis, and on to Independence, Mo., where he will begin again to try to trace the trail out to where the Santa Fe and Oregon trails parted; then on up to Grand Island, Nebr., where the junction is made with the main trail from Omaha. He is especially anxious to locate the point where the Oregon and Santa Fe trails parted.

In addition to hunting out and marking this route, Mr. Meeker is going to use his utmost endeavors to influence Congress to make provision for a great paved national highway; to keep the memory of this great movement constantly before the minds of coming generations. While he may not be able to have it all accomplished, especially in his life time, yet his efforts will not be without some results.

Some may justly think that this is all sentiment and isn't worth while. To all such, let me say that these hardy pioneers thru untold suffering and all other disagreeable experiences of frontier life, succeeded in holding for this government a tract of land over one third as large as that wrested from the Crown of England by the Revolutionary War, and over three-fourths as large as the territory brought back to the national government through the great and horrible experience of the Civil War. When we look at it from this standpoint, we ask you candidly, is it worth while?

*Washington, D. C.*

Lincoln, Ill., Jan. 20.—Investigation shows that the feeble-minded children in the state asylum at this place have suffered 150 accidents since last August. Similar experiences in other state asylums for unfortunate persons forces the question whether the authorities in such institutions are in sympathy with their work or are simply there to draw a salary.

## CURRENT COMMENTS

### A SLOW CONGRESS.

People are wondering why Congress is doing nothing. A few bills relating to money matters were introduced before Christmas and referred to the proper committees. Since then pension claims and federal appointments have taken up all the time. Two months have passed since Congress convened and yet not one measure of any consequence has been acted upon. But this is not the worst. There will be very little done during the entire session because this is election year and the country is more nearly on a political tilt than it has been for many years. The panic was wholly in favor of the Democrats and they do not want to agitate in Congress anything that will lose them any advantage. The Republicans are too cautious and understand the situation too well to act radically for fear it may cost them their influence and so turn the tide in public sentiment as to give the Democrats the victory next November. For these reasons we do not need to expect any swift action or radical legislation from this Congress. They understand that they are paid just the same whether they do much or little.

### THE CIRCULATING MEDIA IN 1837.

In the panic of 1837 the shortage of currency was far worse than it has been in the present stringency. Captain Marryat describes the condition then in his "A Diary of America," as follows: "The distress for change has produced a curious remedy. Every man is, now, his own banker. Go to the theaters and places of public amusement, and instead of change, you receive an I. O. U. from the treasury. At the hotels and oyster cellars it is the same thing. Call for a glass of brandy and water, and the change, if you happened to give him any real money, is fifteen tickets issued by some other business firm, each good for one glass of brandy and water. The barbers give you tickets, of their own making, good for so many shaves; and were there beggars in the streets, I presume they would give you tickets in change, good for so much philanthropy. Dealers in general give out their own bank notes, or, as they are called here, shin plasters, which are good for one dollar, and from that down to two and a half cents, all of which are redeemable only upon a general return to cash payments. Hence arises another variety of exchanges in Wall Street:

"'Tom, do you want any oysters for lunch today?'

"'Yes.'

"'Then here's a ticket, and give me two shaves in return.'"

### A HISTORY OF RUSSIA'S REVOLUTIONARY MOVEMENTS.

Prof. Milyoukoo, member of the Third Duma and leader of the Constitutional Democrats, came to this country upon request recently for the sole purpose of making his address upon the Political Condition in Russia, to the Civic Forum. He divides the present revolutionary movement in Russia into four phases; the national, when general dissatisfaction, grown acute after the Japanese war, spread through all classes, and consummated in the promulgation of the Manifesto of Oct. 30, 1905; the revolutionary, when the Socialists, misinterpreting the success of the national movement, and thinking that they could

not only expect a change in the system of government, but could overthrow the whole economic system, attempted unsuccessfully to carry out their program; the constitutional, in which, under the lead of the Constitutional Democrats, the first Duma tried to institute real constitutional government; and the counter revolutionary, which, beginning with the dissolution of the first Duma, and emphasized by the violation of the "Fundamental Law" in the new mode of election for the third Duma, is dominant now. In this latter phase the court and the nobility are in the lead at present.

#### Rise and Fall of the Revolution.

Prof. Milyoukoo also made clear what most Americans had not hitherto understood—why the Czar yielded so much for a time, and why it is now possible for him to regain so much again. The first phase of the movement opened with the famous Petition of Right, formulated on Nov. 22, 1904, by members of the gentry and concurred in by all parties. Two months later it was reinforced by the first appearance of the working masses, whom Father Gapon led to the Winter Palace on the Red Sunday, Jan. 22, 1905.

In the general strike, which won the great triumph at the Manifesto of Oct. 30, 1905, almost all the ranks of society joined. The capitalists supported their laborers while on strike by paying their wages for the entire time. Private shops and offices voluntarily closed. Professors forcefully told the government that it must not oppose the meetings held within the walls of the higher institutions of learning. The juries declared themselves unable to pronounce sentences during the days of the strike, while judges and tribunals went on strike with the rest. Even the officials in several State offices stopped their work. In short, it was an outbreak of universal enthusiasm, which proved to the government that further resistance was impossible and brought it to a surrender. The success of the strike stimulated the revolutionary elements to over-confidence. The Socialists concluded that they were strong enough to get what they wanted, and on Nov. 11, turned against their capitalist allies by demanding the introduction of the eight-hour day. The result was disastrous. The private and government factories, challenged by their workmen, replied with a series of lockouts. About 100,000 men lost their work, and the threat of a new strike proved ineffective. After two weeks of hopeless resistance, the Socialist Council had to surrender, and give up the attempt. The government, encouraged by the Socialist failure, arrested the president of their Council, and then, when the Socialists attempted an armed insurrection in Moscow, the government suppressed it in ten days of haphazard fighting, and all hope of permanent revolution in Russia was at an end. The movement was suppressed thruout the Empire. But the problem of the peasants who constitute 85 per cent of the population remained. The peasants were not Socialists, but they wanted land.

Thenceforth the political parties were differentiated. The revolutionists wanted to give the "whole land to the whole people"; in other words, despoil the landlords of their possessions for the benefit of the peasantry. The government proposed a regular sale of land at the market price, while the constitutional Democrats proposed a systematic extension of the emancipation reform of 1861, by dealing out additional allotments to the communes from the free (crown) lands, and from the larger private estates. The question, even yet, has not reached a final solution, altho the government has done something toward carrying out its program.

#### The Force of Reaction.

The failure of the people to respond to any extent to the Viborg Manifesto, issued by the Constitutional Democrats, after the dissolution of the First Duma, once more showed the government that it had overestimated the strength of the organized revolutionary movement, so that with the end of the first Duma the counter-revolution set in and has gained headway at every move. On the side of the autocracy the Union of the Russian People, or party of True Russians, was formed, who, composed of the lowest portion of the population, although sanctioned by the highest authority, made counter-demonstrations against the revolutionists. But in voting power, they have been weak. Even in the present Duma they number only thirty-four, and could summon only sixty votes altogether to support the Czar's title of autocrat. The Nobles, however, the other reactionary force, while making very little noise in their political exertions, have, through their "Council of United Nobility," achieved far more positive results. They would not be adverse to a constitution if,

The Czar is its Master.

with it, there would come a change in the organization of society. They are constitutional, but not democratic. The new law gives them a majority in the Duma. In order to remove the danger from the peasantry they voted to abolish the system of the commune, under which land is held collectively, and tried to institute a regime of private property. The government, in compliance with their wishes, is now starting a new agrarian policy, which will provoke the social struggle of the rich and the poor in its most venomous form. Of course the attention of the peasants will thus be drawn from the landlord's estates to their own internal disputes. The autocracy and the nobility are now practically in league.

On the other hand, according to Prof. Milyoukoo, the Nobles do not pretend to dispute in principle the autocratic rights and privileges. They are quite ready to admit, in theory, that the historical power of the Czar remains what it ever was, and that the Czar preserves his free will in dealing with the "Fundamental Law" of the Empire, as he dealt with it June 20, 1907, to their great benefit. A kind of political equilibrium is certainly attained. The immediate danger that the national representation, or Duma, is to be abolished entirely is now averted, and this is the only consoling outlook for the masses in the situation.

# THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## SHOULD A MAGAZINE LEAD ITS READERS OR MERELY REFLECT THEIR STANDARDS?

THERE are two ways to edit a magazine. The easiest way is for the Editor to keep a scrap-pile-office into which miscellaneous matter drifts, and fill his paper from this heterogeneous collection. The other, the one which we prefer, is to develop and direct the reader by giving matter which contributes intellectual power and definite sentiment on all the issues of life.

If a magazine is not a teacher, then it is a clown. That is, if the magazine does not seek to mold the thought of its constituency, then it has but one field left, and that is to *entertain* them by printing what suits their tastes.

We believe it would be good for our constituents to have a broad world-wide grasp of life as it is lived today. In our literary department we have been giving some very able papers, while in the current comments we have endeavored to analyze the great movements of the day. The news department aims to give results of these movements as they progress. The home department has definite aims, as is indicated by such topics as health, cooking, child training and young peoples' problems.

We do not deny that we are trying hard to lead and develop. When we must give up this aim then the Editor will seek another field of labor.

### TELL WHY.

Too many people are indefinite in their convictions. This statement does not imply that conviction means dogmatism and contention, for a person can have the most earnest conviction on a question, and, at the same time, treat with consideration all who differ from him.

Many people profess to believe a thing and do certain things simply because a church conference or some other authorized body has decreed that so-and-so is right. Such people are mechanical and lifeless, because a person without personal conviction adds no

stability to society. They are just whatever the largest crowd is. If that crowd is right, then they happen to be on the right side also, and vice versa. But they do not help to make things right, because they themselves are neutral, so far as positive forces go. Such people are like a ship without a rudder,—just helplessly driven hither and thither, never arriving at any definite place.

If you are right, then fearlessly face the world and they will eventually crown you a hero, and endorse your platform. When the INGLENOOK echoes any moral principle there will be no wincing or recanting. We want clear, straight-cut sentiment for our magazine. We have no other policy than to teach and defend right living.

### HOW TO READ.

IN her article on Literature for Children, in this issue, Mrs. Charles expresses a thought to which we want to call attention. She says: "Books are a curse if they merely excite the sensibilities and stimulate the nerves, but do not stir the muscles, quicken the will and set the hand and foot to work under the promptings of a cheerful heart."

We say Amen, to that sensible statement. We are trying to have the INGLENOOK grow along the line indicated by Mrs. Charles.

### HAVE YOU SOLVED THOSE PROBLEMS?

IN the last issue of 1907 we gave a problem about three men marketing different quantities of eggs at the same price, but receiving an equal amount of money for their eggs.

In No. 2, of 1908, we gave another problem about two men dividing a hog which they had bought. Some answers have been received and we expect to publish the correct answers, if they are received. Now, Johnny, Susie, and even Grandpap, scratch your heads and work these problems!

### THE DEMAND FOR MORE FUSS AND FEATHERS.

A MAN, with all kinds of mysterious titles before and behind his name, was secured to give a lecture for several hundred dollars, in a town where the Editor once lived. His picture was displayed in glowing colors wherever a place could be found in which to exhibit the advertisement. Tickets were one dollar. The man was coming three thousand miles to tell us (according to reports) a vast amount of good things, which we, poor mortals, did not know and could never find out. Everybody went to hear him, and here is the substance of the lecture:

1. About twenty stale anecdotes which had been before the public for thirty years. They were so old that we would neither read nor tell them any more.

2. A thimbleful of common, everyday adages which

every washerwoman and every street laborer in the town used, day after day, in their daily conversation.

But everybody counted it a big affair, and rich as the gold of Ophir. The effort to get the man was big, the price to hear him was big, his name was big, his titles and degrees sounded big, the crowd was big, and, indeed, it was a big hit, because it satisfied the crowd. But here is the point,—people judge the worth of some things by the display made of them, rather than by their intrinsic worth.

Sometimes there are short essays in the INGLENOOK from Sarah Jones, Pumpkin Hollow, Mich., or John Smith, Farmers' Crossroads, Ind., which contains as rich a vein of thought as was ever expressed on the subject discussed, but because of the plainness of the name and absence of display, some readers count the article second grade.

Should we advertise an article by some royal person of Europe, giving his titles of honor, and degrees of learning, how rare and rich you would think it was, altho your mother had told you better things long ago, for nothing, and you never gave her any credit for it nor counted her a great woman.

Long ago we began the practice of disregarding the clothes a man wears, and the flexibility of his tongue, and the various sorts of literary and honorable appendages attached to his ancestry and himself, and estimated his worth upon a more permanent basis than mere outward appearances and noise.

Will you analyze the articles in the INGLENOOK thus and, thereby, receive more good from them?

#### A LIVE TOAD BLASTED OUT OF SOLID ROCK.

You have all heard wonderful fish stories, but here comes a toad story that eclipses everything brought to light so far, and the remarkable thing about it is, that it is true.

Geologists claim the rock in which the toad was found has been formed for a thousand years. This makes one shake his head to think of a toad living in such a habitat as that for such a long period without food or air, but be that as it may, the fellow had been in the rock long enough to have his colors all faded out of his skin, and he has been out of his prison now for eight months and has taken no nourishment whatever, altho he is alive and in good health.

The spade foot toads, to which class this specimen belongs, are known to burrow in the ground and sleep their lives away, except during the breeding season of the year. Other specimens have been found in solid earth without any exit to their burrow, but how this one became encased in solid rock, and when, and how he lived is a puzzle to scientists. Some human species that are without work, would be glad to know his secret to long fasting.

In order that our readers should have the facts as

correctly as possible, we wrote the Zoological Society of New York, and received the following information. This is only a part of their description, but it is full enough to get the situation and facts fully before the reader:

"From Butte, Montana, there recently came indisputable record of a toad exhumed from limestone, at a depth of 150 feet from the surface. In this case, the man making the discovery was a thoroly practical mining engineer. He saved the toad, sent it to the Reptile House for identification, and we are thereby instructed that at least one species of North American batrachian gets into strange predicaments. It is interesting to note that the creature figuring in this case represents a species of pronounced subterranean habits—the spade foot toad, *Scaphiopus hammondi*.

"It is to Mr. Charles A. Van Zandt, of Butte, Montana, that the Society is indebted for the opportunity of examining the interesting specimen. During mining operations, Mr. Van Zandt was sinking a shaft into limestone formation. At a depth of 150 feet, during progress through apparently solid rock, the toad was exhumed. Mr. Van Zandt personally took the specimen to his home and placed it in a porcelain crock. Here it remained for seven months, refusing all food. A representative of Mr. Van Zandt coming to New York reported the matter to Dr. Louis P. Gratacap, Curator of Mineralogy in the American Museum of Natural History. Dr. Gratacap considered the matter so extraordinary that he at once referred the matter to the Park with the result of communication with Mr. Van Zandt.

"The spade foot toad is yet living in the porcelain jar, in which he has contentedly nestled for eight months. He steadily refuses food, but appears to be vigorous and in good health. He is much paler than the normal specimens—his colors having possibly faded from his imprisonment—as to the duration of which we have no idea. Animals that normally dwell in perfect darkness—like those frequenting under-ground rivers—are always practically colorless, but their pale hues are the result of extended evolution. It would be purely theoretical of course, and rather sensational, to declare this toad to have been imprisoned in the rock so long that its pattern faded. However, circumstances point to just those conditions—and the refusal of food may be caused by a partial or total lack of vision.

Chicago, Ill., Feb. 1, 1908.—At a meeting of wealthy citizens a charity fund of \$100,000 was started to help relieve the 60,000 unemployed people of the city. New York has a similar move, altho many factories have resumed work, yet most of them are using less help than formerly. Out of a home, out of money and out of bread in the midst of cold weather is severe enough. Several large business firms are giving temporary shelter and food to the worthy poor in all the larger cities until work can be found. Crime and anarchy follow in the wake of idleness and hunger.

## Incidents of a Dakota School Teacher

Emma Horning

At the charming age of sixteen she found herself in possession of her first teacher's certificate, and mistress of a pretty, white schoolhouse, four miles from home. Her father supplied her with a beautiful black horse, new vehicle, harness and flynets, also a teacher's clock and bell.

The wonderful morning of the first day arrived, and she drove to her seat of supreme control with all the dignity of a school ma'am. The children came strolling in from many directions, over the beautiful prairie, and timidly did all they could to help the new teacher and make her feel at home. They admired the beautiful horse so much, which was named "Bird," that they renamed her "Black Beauty."

Soon nine o'clock came, and the awful task of assigning lessons in an ungraded school,—doubly awful to an inexperienced teacher. After a day of experiment, and after being studied by so many bright eyes all day, until they knew her perhaps better than she knew herself, she rested on her couch at home from the hardest day's work she ever did.

When snow came, and she could drive no longer, her father built her a little cottage which could be placed on wheels and taken any place she taught, for boarding places are very hard to secure in small prairie homes. A small gasoline stove on which to cook, a hard (not anthracite) coal fire, by which to sit, with plenty of books to read, she and her brother spent many a cozy evening together. O the pleasure of spending a night in such a cottage when a blizzard is roaring outside, when the beautiful banks switch, and swirl, and pile as high as the eaves, and the wind whistles a dreamy tune down the stove pipe!

"Blow high, blow low, not all your snow  
Could quench our hearth-fire's ruddy glow."

A story is twice as good under such surroundings. Such fun at recess and noons! Fox and geese, pull away, prisoner's base, coasting! And she was one of them and had as much fun as the rest. With what rosy cheeks, glowing hearts and rested minds they re-entered the schoolhouse to climb the mountain of knowledge! She won their hearts, but life has its "seamy side" everywhere. "That mischievous boy!"

every teacher called him bad. How he did love to make the pupils laugh at his secret pranks! He was in the height of his glory if he could make the young teacher laugh when she should not. And that paper wad! with many other naughty things which had bothered all his teachers.

Oh my, what should she do! Her friends sympathized with her, and told her all kinds of cures, even the cures of bygone school days. Nothing was of any lasting benefit. As a last remedy his parents told her to whip him as others had done. She did it, but it was her first and last case of whipping. Still he bothered. He told his mother he did not want to be bad and cried about it, and they took him out of school awhile. Then he wrote a beautiful note to the teacher, begging to come back. After this he did better and now he has a beautiful home and children of his own.

Soon came the springtime, with its birds, its flowers, and its sunshine. The acres of wild flowers were the delight of the children. They covered their teacher with wreaths and bouquets. They almost covered the desk with their treasures of sky-blue and gold. The gophers also furnished them much pastime. They became so tame that the boldest would eat from the hands of the children, while the more timid ones would stand back and whistle for some of the dainties to be thrown to them. They became so well acquainted that they would even come into the house during school hours, and creep into the lunch baskets and help themselves. The children often scattered crumbs on the floor for their benefit. It is really amusing to see them eat. They sit up on their hind feet, holding the bread in their front paws, like little hands, then they nibble, and at the same time wink at you, then jerk their bushy tails. Nature study is good in its place, but these gophers attracted too much of the children's attention, so the teacher shut the door and left them scratch on the outside till they found they could not get in and then went away.

One afternoon she closed school early for the purpose of visiting another school, on the way home. While at this school two great clouds began to form,—the one in the east and the other in the west. Swift

little messenger clouds began to hurry to the zenith. On came the larger ones like two great armies, arrayed for battle. The fire flashed, the thunder roared, the great black and green clouds rolled like great volumes of smoke. On, on they came. Just a few feet. Hush! All nature holds its breath to witness the awful scene. Crash! Roar! and the mighty conflict is over. The inmates of the schoolhouse thought they were the objects of its might's wrath. The dashing floods of wind and rain threw its intensity on the small house. The sides swayed, the rain bubbled in around the window sash and dashed in under the door till the floor was flooded.

School was dismissed and the children watched the mighty contest in silence, for their voices could not be heard above the awful roar. The small ravine near by became a raging river, where before had been dry ground. The schoolyard became a sheet of water. Black Beauty stood with her back to the wind, shivering from cold and fright. Towards dusk the rain ceased, and the children living nearest the schoolhouse took off their shoes and scampered for home. The nearest house was just across the ravine, so the rest prepared to go to this place in the buggy. All went well till they got to the middle of the ravine, when down they went. The water covered the horse's back and came into the buggy. Wet? Some, but they got through alive and went back for the rest, finding a shallower place next time. About dark many of the parents came for the children, but the teacher stayed at this house all night, glad for a dry, warm place to sleep.

*Fruita, Colo.*

### THE COMMON DAYS.

NANCY D. UNDERHILL.

THE glad Christmas festival is past. I wonder how we spent it; how many of us thought to devote even a little portion of that glad time to the One whose birth we were supposed to commemorate. It seems to me, it would be such a blessed season, if we would all give to him preëminence in our thots and words of praise. But the Christmas holidays are passed, and the *common days* of the year are coming to us, one by one to be passed—how? In the common somber way as tho they were just so many periods of time—so many budgets of plain, unsophistical hours to be passed by as we pass the fenceposts along the roadside? Or shall we accept them as so many blessed opportunities to live another precious day with and for our dear Savior, who says, "Lo, I am with you always"?

At Christmas time, perhaps, we made a feast, and, by invitation, some of our dear ones were with us. To-day let us have a feast of love and prayer, and invite the dear Lord—our Elder Brother, to be with us by his Holy Spirit. Please see Rev. 3: 20. Could we

have a more desirable guest? So, let us accept the plain, common days as they come—fresh from the dear Father's bountiful hand, as so many gracious opportunities to serve the kindest and best master the universe has ever known—even One who so loves us that he willingly laid down his life as a loving sacrifice for us. Blessed opportunities to speak sweet, kind words of comfort and encouragement to some precious soul whose heart may thereby be made lighter. Opportunities to bestow a loving smile upon some dear child whom our Savior loves. Opportunities for kind thots, gentle manners, and useful deeds. Opportunities of forgiveness, of restoration, of helpfulness, of life-giving influence. Opportunities to lift up the soul that is down; to lead some precious soul who is groping blindly along the broad way that leads to death, out of darkness and into the path of safety which leads to eternal life. Yes, precious, golden opportunities of trimming our lamps afresh, and bringing them each morning to the source of all that is good, to be cleansed and refilled, so that we may have them ever ready to cast the bright rays of life and love, hope and cheer to the soul in the dark place who is blindly groping about for the friendly guide-post of Truth to direct them to the safe and right way which leads to eternal life and happiness.

Oh, blessed common days! Every one an invaluable gift from God to us—yes, to you—dear reader, and to me,—to be accepted with becoming appreciation and gratitude, and to be *used*, every moment of them. For like precious jewels (which they are) the more they are used, the more beautifully they sparkle, the more brightly they shine, ever sending out rays of heavenly light into the dark corners of the world, warming to renewed life dear human hearts; lighting up homes and faces to smile and blossom as real window gardens of rarest beauty; to gladden the heart of our all wise gardener who knows how to plant Heaven into the hearts of his dear ones.

### CLEANLINESS.

Number One.

FLORA E. TEAGUE.

I HAVE known dainty women who seemed to feel that men in general were not so cleanly and particular as they might be. Their hands had not come in contact with the lavatories before the handling and eating of food. Probably, it may be true that they are sometimes careless or indifferent in regard to as dainty habits as some women possess. They, probably too, are not as careful as were the cleanly Jews in the time of the Master, who found fault with him and his disciples because of their lack of care and observance of ceremonial rules of cleanliness. They themselves, "except they wash their hands oft, eat not." Mark 7: 3.

On the other hand men have fully as good reasons to find fault with women for their lack of cleanliness. Men, in general, are fond of water, and flush and cleanse themselves well inwardly. The result is good health, clear and healthy complexions, freedom from chronic troubles, etc. Women seldom drink water unless thirsty. The result is, foul and unclean systems, stagnation, and ere long constipation, rashes, blotches, muddy complexions, and many other unpleasant conditions. The inner man needs washing and cleansing fully as much as the outer man. Impurities can only be carried away by the aid of healthy, clean bodies. If you find cold water too chilling, drink copious quantities of warm water before and between meals. Drink whether you are thirsty or not. Many aches, ills, pains, and doctor bills you will thus be enabled to save.

But whatever you do, clean up, inside, outside, and all around. You will feel better, look better, and make others better. Cleanliness inside as well as out is next to godliness.

#### ABECEDARY HISTORY OF 1907.

**A** is for Airships, which will doubtless ere long  
The earth's circumambient atmosphere throng;  
**B** is for Bryan, who says he's still willing,  
The chair presidential, next time to be filling;  
**C** is for Coin which T. R. changed the look of,  
And also for Cocktail, which Fairbanks partook of;  
**D** is for Duma, dissolved by Czar Nicholas,  
Diabolo also—the French game to tickle us;  
**E** means Exclusion of Mongol cheap labor—  
(That rule is all bosh about "loving our neighbor");  
**F** stands for Fleet which to Big Stick has pandered,  
And also for Fine at last forced on the Standard;  
**G** stands for Gyroscope, keeping cars steady,  
Also Graft, gaining ground in spite of our Teddy;  
**H** is for Harriman, Haywood and Hearst—  
(It puzzled T. R. to say which was the worst);  
**I** stands for ever increased Immigration,  
An imminent menace, 'twould seem, to the nation;  
**J** stands for jingoist Japanese clatter,  
Which nearly caused war for a very small matter;  
**K** stands for Korea, absorbed by Japan,  
For Kentuckians also, now "dry" to a man;  
**L** is for Liquor local option is licking,  
And also for Labor, well paid, but still kicking;  
**M** is for Money, both scarce and "scared"—  
Made so by the rottenness muck-raking aired;  
**N** is for Nations in conference for peace,  
And also for Nevada, where strikes scare the police;  
**O** naturally stands for the state Oklahoma,  
Whose radical laws have raised such an aroma;  
**P**'s for the Panama ditch on the Isthmus,  
Persistently pushed and half done by next Christmas;  
**Q**'s for Quebec, whose new bridge fell in sections,  
And also queer Questions which come up at elections;  
**R** is for radical Railroad Rate Regulation,  
And also for Roosevelt, the IT of the nation;  
**S** is for Soul, by scientists weighed,  
And likewise for Strikes, which our progress delayed;  
**T**'s for T. R., whom "malefactors" are bitter on,  
And also for Taft, the all-round lid sitter-on;  
**U**'s for "Undesirable" people unhung—

(They say that for saying this Roosevelt was stung;)  
**V** stands for Vancouver, which drove out the Japs,  
Likewise Vardaman's valedictory—perhaps;  
**W**'s for Waterways, Warships and Wireless,  
All begging for "more" in a way that is tireless;  
**X** is for X-rays, whose use is extending,  
And also for "X-bills," which no one is lending;  
**Y** is for Yankees—they're peaceable chaps,  
Except, for example, when "sicked" on the Japs;  
**Z** stands for Zeal hunting absolute Zero,  
And also for Zeppelin, aeronautical hero.  
And now, my dear friends, I've no letters remaining,  
I've finished the job that I undertook,  
And hence I'll stop, so you'll not be complaining  
Because I run on so, like "Tennyson's brook."

E. Dubois Fosdick, in Pathfinder.

#### THE IDEAL NEWSPAPER.

A GREAT many busy, thinking people have become disgusted with the bulky newspapers of our day, because, to hunt for news in a thirty-two page daily paper is like hunting for a needle in a haystack. To offset this waste of time and money The Little Chronicle, a weekly newspaper about the size of the news and comment departments in the INGLENOOK, has been started in Chicago during the past few years. This new paper is very small in size, but gives all the essential news at home and abroad each week, and sells for \$1.50 per year. It contains nothing but news, and busy people are supporting the paper because it does not print a whole lot of stuff which thinking people do not want to see. The Pathfinder at Washington D. C. is doing the same thing.

We admire this reform movement in newspaperdom. The daily paper, under its present form, is a nuisance and wasteful. Our news and comments give the news of the world, clean and full, and throws in a large bulk of home and instructive reading besides,—all for one dollar per year. We have failed to see our offer equalled yet by any publication.

The launching of the Little Chronicle, and the Pathfinder in the past few years confirms our belief that the INGLENOOK is an ideal home paper which will be imitated by the newspapers in fifty years from now more than it is appreciated at present. We are not bragging too much about our own magazine, we are simply trying to awaken drowsy minds to the evils of bad literature and the need of reform in the papers which comes into your home.

It takes lots of talk, argument and fire to get some people to do what they know is their duty to do. If all papers were clean and newsy today so that Christian people were accustomed to wholesome literature, then people would go mad if a paper like the ordinary scandal sheets of today were brought into your home. They would not have it if they were paid for reading it, but now they pay for it and can hardly wait until the day for their dose of poison to arrive, so that they and all the children can dope themselves again with scandal, sport, crime, nonsense, lies and a few items of news.

# Should Agriculture Be Taught in the Public Schools?

John H. Nowlan

STUDIES may be divided into two classes—economic and cultural. Agriculture is an economic study, for it is one of the basic elements of national prosperity, although it has not been taught in an educational manner in the past. In fact, to be strictly true, it has not been taught at all, largely because it has been supposed to afford no scope for mental activity. Educate our boys and girls in the art and science of agriculture; let them see that it is just as uplifting and ennobling as any other vocation; that the agriculturist is to be as much honored and respected as any man; that his vocation calls for skill and thought; that it is no more arduous than many, and freer than most of occupations.

Such a course will check the restless tide of country blood which is now rushing toward the city by demonstrating that there is room for thought in the study of the soil, plants and animals. If you teach history the child becomes interested in history. Teach geography and he takes an interest in geography. It is just as reasonable then to expect the child to take an interest in agriculture when it is once taught to him.

Teach the child some of the fundamental principles of agriculture in school, and then he will go on to a broader and a fuller knowledge. The school is the place for teaching fundamental knowledge, hence if something is to be learned about agriculture the school is the place to teach it. The country boy receives a smattering of nearly all subjects except the one industry that has the most to do with his success or failure in life. He sees the corn grow but knows nothing of the manner of its growth. He can give you an interesting account of Sherman's advance upon Atlanta, but to save his life he can't tell how to stop the advance of the army-worm upon the cornfield. He can prove problem after problem in geometry, but he can't prove which insects are harmful and which are not. Not only that but often he not only doesn't know, but hasn't even the slightest idea.

It is a cultural study also. The child should be in touch with nature so that he may the better follow whatever occupation he may select. Should he be a lawyer he will find a knowledge of the science of agriculture invaluable, for many of his clients will be farmers, or will have agricultural interests. A thorough knowledge of plant physiology and the relation plants bear to the animal world will be a great aid to the doctor. Lessons are most forcible when drawn from the environments of the hearers. To proceed from the *unknown* to the *related known* is a pedagogical method. This was the method of Christ, the

ideal teacher of all ages. Observe how aptly his illustrations were chosen. They appeal to the housewife, the shepherd, the fisher, the husbandman, the laborer—to men and women in every vocation. Many ministers preach to rural congregations, hence, to do their best work many of their illustrations should be drawn from nature, because their hearers will be more or less conversant with nature.

Teach agriculture, because it pays. This is a commercial age. Anything to be of value to the world at large must have a commercial value. Teach that agriculture offers opportunities for the educated man—that there is money in scientific farming, and you will have created a demand for instruction therein.

Persons who admit the value of a study of agriculture plead that the teachers are not prepared to teach it. This is no excuse. Teachers are only mortals. If we wait for them to voluntarily prepare themselves before there is a demand for their services we will wait always. Create the demand and the teachers will work up to the standard. When the laws of the various states compelled teachers to teach physiology their only alternative was to qualify or retire.

To those who argue that the school course would be too crowded, I would say—crowd out something else. You have a right to expect results from what you pay for. The farmer pays for the rural schools, and he has a right to demand that a part of the instructions shall be along lines for the benefit of his sons and daughters. Latin and mathematics may develop reasoning powers, therefore they are important in the curriculum. Agriculture will do the same, and develop the perceptive faculties as well. Few men will long continue a losing game. When they learn the source of profit or loss they will soon learn to change their plans. When men are convinced that wheat is being grown at a loss and clover at a profit you will see more clover fields and fewer wheat fields.

In the teaching of agriculture there is a good opportunity to teach duty to fellowmen. "The earth is the Lord's and the fullness thereof." He who takes something without giving an equivalent is robbing. He who takes from the earth the accumulated fertility of centuries without compensating for the same is a soil robber—he is a surface miner. The highwayman takes only the value that chances to be on the person of his victim, but he who exhausts the fertility of the soil is robbing the helpless—he is taking from unborn generations. "Labor is worship" and I can conceive of no better way of worshiping than causing the earth to yield food for man and beast.

We should do all in our power to maintain or increase the fertility of the plot of ground under our care. This we cannot do till we understand the workings of nature. When our young men and women see nature in her true light many of them may be induced to stay on the farm. There are many incompetent clerks, third-rate lawyers, or what-not who would have been successes on the farm, or at some allied manual labor. Therefore, I say teach agriculture in the public schools.

*Mulberry Grove, Ill.*

#### LITERATURE FOR CHILDREN.

MRS. M. E. S. CHARLES.

It is a cause for congratulation that the educators of today, and those having charge of young people, are beginning to realize that the wonderful thing we call the human mind is in the little child as well as in the gray-haired grandfather.

Our literature for children should proceed on this idea, and treat its little readers as representatives of the human mind on its way to its full rights and powers and quite true to its birth-right, as far as it can reach out into the future.

The senses should be skillfully appealed to, and the higher spheres of the reason, conscience and affection, thus be effectually reached. Pictures, whether in words, or lines, or colors, are symbols, and the child's mind is a rare master of all true symbols of nature. There is no end to the range of susceptibility in children to impressions from this source; and all the chords of feeling, and impulse, pathos and humor, seem waiting to be played upon. Instead of needing to be laboriously taught to pass from one mental stage to another, they go by alternations as easy as if change were a necessity of nature and not the work of the striving will.

Our books for children should conform to this great law and grade from grave to gay, from gentle to severe as is the way of all high literature. These books should be truthful as well as interesting; they should also be true to American ideas. We should also demand that our children be taught to regard American principles, (so far as good), as matters of course, and their books should take these principles for granted and illustrate them with all possible interest and power. Children should be trained in the belief that here, the opportunities for education, labor, enterprise, freedom and influence are to be thrown open to all alike.

Playfulness does not require the sacrifice of good sense or sound principle or serious purpose, but subjects them to certain conditions; and there is no form in which exalted characters or sacred truths are brought home more effectually to the hearts of the young than in the stories that make life speak for itself, and play them into the affections and fancy; but

it does require that the laws of attention and emotion, the unities and varieties of aesthetic art, shall be observed.

We believe in dynamic reading, if we may so use the term; and wish to make a decided point of this, that books are a *curse if they merely excite the sensibilities and stimulate the nerves, but do not stir the muscles, quicken the will, and set the hand and foot to work under the promptings of a cheerful heart.*

Undoubtedly many children read too much and pay a heavy penalty in the loss of vital forces; but the best books are good tonics and are as refreshing and strengthening as sunshine and salt water. Let us encourage this tonic quality in our literature for children, and favor as much of sound muscular morality and religion, as stories of adventure, sketches of sports, hints of exercise and health, with all manner of winning illustrations, can give.

All moving forces, whether domestic, social, or religious, reach children most effectually through personal influence; not only do they imitate the examples, but they seem to imbibe the spirit of their associates or teachers. Hence the importance of having our best people write for children. The young readers may not take in the whole of the influence consciously at once, but they are more receptive than they know and take in the grace of refined manner and pure culture without being aware of the fact at the time.

Men and women are but grown up children and probably owe more to the books they read than they, at first thought, would be willing to admit. In after years we may re-read critically, a book which in former years we had thought teemed with rich gems, and we are surprised to see how it changes in its proportions. It loses in those parts which have been pre-eminent in our memory and increases in other parts scarcely noticed before.

Let us be careful to not treat with too much carelessness the things we have outgrown. Before we go on it is well that we appreciate what we leave behind, and to see how the intellectual abodes we are leaving may still be to others a store-house of knowledge and pleasure.

*Spiceland, Ind.*

#### A QUIZ ON LEGAL TERMS.

1. What is a writ of mandamus?
2. What is a replevin action?
3. What is a statute of limitations?
4. What is a caveat?
5. What is the meaning of *nolle prosequi*?
6. What is a writ of habeas corpus?
7. What is a demurrer?
8. What is compounding a felony?

Most of the above legal terms refer to common events in every neighborhood.

# The Benefits of Hard Times

Paul Mohler

WE are not looking for any very hard times in the near future; and perhaps we shall never see them, but we are going to come near enough to it that we can afford to do some serious thinking. I think there are some special advantages to the whole country in a period of hard times, that are likely to be overlooked in our dread of its inconveniences.

To understand the benefits of hard times, it is necessary to consider the drawbacks to a prolonged period of good times. Strange as it may seem, these are quite pronounced. As a matter of fact, it is true that a period of hard times not only follows a period of prosperity, but is in a great measure caused by that prosperity.

When seasons are favorable, and crops grow well for some years in succession, farmers grow careless in their methods of farming. The odd corners that are hard to cultivate are left to the weeds. Manure is left to waste. Plowing, cultivating and harvesting of crops are carelessly done. All this tends to poverty of the worst kind—a shortage of food supplies.

When iron, and coal, and cotton and wool are plentiful and the people have plenty of money with which to buy, they become wasteful of all that they use. Machinery, clothing, and indeed all articles that they use, are cast aside while they are yet new. At the present time, in any prosperous farming community, you can see machines of the most expensive type that have been discarded for new ones of the same kind, when a few dollars and a little time would have put them in good repair. Many a farmer's profits are lying around in half worn out machinery. Many a laboring man's wages have gone to the rag bag in half worn out clothing. These things all tend to poverty.

When work is plentiful and wages are good, men grow indolent. When two days of work will buy board for a week; when a week of work will earn a suit of fine clothes; and when the loss of one job means the chance to get a better one, many workingmen become idlers. During the harvest season of 1907, there were men standing idle in Cando because they couldn't get \$3.00 per day and board for the kind of work they were willing to do. By this time, I am safe in saying that their poverty has overtaken them.

When young men find vast hoards of wealth awaiting their hands; when the wealth piled up by many hands is given to one man to spend; when the forces of production seem to be so well organized that wealth shall go on increasing for the captains of industry—then rich men grow reckless in their extravagances. Fortunes are spent for jewels, at gambling tables, and in riotous living. Other men with less money catch

the fever, which spreads even to the poor mechanic; until the whole population is caught in a great epidemic of profligacy. Surely poverty is near such a condition.

In contrast to good times, hard times produce wealth. There is nothing that teaches a farmer his business so quickly as a few crop failures. Men soon learn under the spur of necessity to use all of their land and to increase its fertility, as well as to save all that it produces. All the people economize; laboring men work steadily; even rich men's sons go to work, and the inventive genius of the entire nation is set to the great task of making the most out of a little.

Do you know when the railroads began using the larger freight cars? It was in the nineties, when many of them were in the hands of receivers. Do you know when North Dakota was claimed by the homesteader? It was during the same period, when a renter in the Eastern States could not raise enough on the land to pay his rent. Do you know when Kansas awoke to the value of alfalfa? It was when her other crops had dried out. Who knows what a period of hard times might teach us now?

The moral advantages of hard times are still more evident. When times are good, there is the worst kind of idleness—rich idleness. Thousands of our best and strongest young men and women waste their lives in riotous living because they are rich.

Thousands of our strongest young men sink in iniquity because their money put them "in the swim." There is nothing better for the average young man than work, and it takes hard times to bring him to it. When hard times put our idle young men to work, it is a blessing to our nation that can hardly be estimated.

It is hard for a rich man to enter the Kingdom of Heaven. Where his treasure is, there is his heart also. It is hard for the average man to hunger after righteousness with his pocket full of money. Consequently in periods of great prosperity, there is generally a weakening of spiritual life. This was true in the times of Israel's kings, and it is true yet. We have not had much hard times, yet; but already it seems to me that an unusual number of conversions are being reported. When earthly treasures fade away, men turn to the heavenly. If industrial depression, financial stringency, or even crop failures, could end the spiritual apathy that seems to possess the American people, what a glorious thing for our nation it would be!

Perhaps the recent panic, and the present industrial condition will be lesson enough for the present. Perhaps we can correct the evils of our prosperity without

losing it; but let us be assured, and at the same time thankful, that if it becomes necessary for the salvation and blessing of his people that hard times should come, God, our loving Heavenly Father, can very easily bring them.

*Cando, N. Dak.*

### HOURS OF LABOR ON THE FARM.

BY D. Z. ANGLE.

IT is probably true that a great many farmers make their days for labor too long, and their nights for rest and recreation too short to maintain a proper equilibrium of health, comfort and happiness for themselves and the other members of their households. Such persistent application to everyday work often seems necessary, especially at certain seasons of the year, and, of course, every farmer has the right and privilege to run his affairs and direct his operations as he sees fit. Nevertheless, we consider that he is proceeding to his own detriment, if he works himself or members of his family, or hired help, up to, or beyond, the limit of endurance.

What benefit or satisfaction is the wealth of corn, oats, wheat, or gold, when it is obtained at the cost of human health, or life itself? The railroads sometimes pay \$5,000 compensation for a life lost through them. The average farmer would probably require from five to ten years to make that amount on his farm. Then why should he risk on one crop, or even in one day what it would take him, if he lived, many years to produce? We consider the farmer's life to be worth as much as the life of any other person. He is the support of his family, the subduer of the wilderness; the artist of the soil; the mechanic, whose greatest feat is to produce abundantly the golden grain; the banker, whose capital lies hidden in the humus-laden richness of his carefully tilled acres. He is, in fact, the backbone of the nation, and without him no nation can exist. In order to be all this he must labor. But because he is his own boss he need be neither an idler nor a slave to work. Reason should teach him to labor temperately, so as to conserve his health as well as to earn his bread. Men differ greatly as to their individual limits of endurance. An amount of labor that would gradually kill one man, might be performed easily and without dangerous results by another man, but because one can stand long hours of severe labor should not convince him that his young son can stand such great strain without serious consequences. The son may live through it, but meantime acquire so great an aversion to farm-life as to choose some other calling as soon as he has a chance to do so. Usually a boy will not hurt himself working, and should be kept well employed at tasks suited to his strength, and as a means of directing his mind from mischief to useful employment.

Farming is one of the most ennobling and substantial occupations of man, and as such, should be impressed by parents, by word and deed, upon their children's minds, who will then grow up with an intelligent faith, confident of abundant success as a tiller of the soil. They will heed the sayings of the wise man, who said "haste not to be rich," but will proceed to labor moderately and persistently, satisfied with moderate income, to be used discreetly in living the simple, honest life. They will have a desire to be away from the hustle and bustle, hurry and worry, uncertain income and certain distractions of the gilded city.

We believe ten hours each day long enough for any farmer to work in his fields. Probably nine hours are nearer the limit of the average man's strength. Work diligently, but moderately. Exercise temperance in all things pertaining to life's duties and pleasures, and we will have the assurance of the realization of a prosperous, happy and long life,—a life filled with kind acts and the loving assistance of those about us.

*Mt. Vernon, Ill.*

Woman's suffrage is gaining ground rapidly in the British Empire,—Canada being the last country to show decided interest in the question. New Zealand and Australia have agitated this movement for several years, while in other nations of the world, woman seems to be in the ascendancy. Finland has had woman's suffrage for a number of years. Women are preparing themselves for a national movement in this country at an early date.

### HEALTH CULTURE PSYCHOLOGY.

Habit is as strong as the law of gravitation. Aspirations to be good, or great, or strong, or beautiful, or healthy, fall back to the dead level of habit.

Habit trails its chain back to the sun. Its links are forged every day, every moment; and the ever-struggling soul of man toils on, making chains for himself and his progeny.

Freedom, liberty, are ideals toward which the race blindly stumble. Here and there a liberator arises and a link is broken, but no sooner riven than it is welded again by the faithless and the fearful.

Habit is the working of the law in us, in our minds and bodies; and in this law we are bound, with but one power to set us free.

Each individual has a will and that individual will may or may not seek the freedom from slavery to habit's chain.

He who seeks truth finds freedom; even in the seeking, "for the truth shall set you free." Only the spirit finds freedom, and then it chooses servitude for others.—Health Culture.

### HER PROUD MOMENTS.

Overheard during a conversation in which a flag-carrying woman suffragist took part:

Suffragist.—The proudest moment of my life was when I was passenger on an American liner and fell overboard.

Friend.—The proudest moment; but how do you mean?

Suffragist.—A sailor called out, "Man overboard."

## SOME THOUGHTS ON THE DIET QUESTION.

First and foremost, what is food? The answer may be succinctly stated in a few words: those substances which tend to nourish the body and replace the waste. But the matter, at the present time, seems to have resolved itself into a meat diet versus vegetarianism, and much valuable time and gray matter is wasted in practically fruitless discussions as to the merits of the products of the different kingdoms. Yet there are some food elements that seem to be invariably overlooked by the food theorists, although they are of vital importance, and the purpose of this article is to briefly consider one or two of them. Air is one of the most important elements upon which mankind subsists. Few people regard air as a food; but the important fact that more space is devoted to the handling of oxygen in the human body than any other element, is ample proof of the importance attached to it by Mother Nature. We have lately been treated to a fasting tournament, that affords ample proof of the impunity with which the body can disregard solid food; but the length of time the body can exist without oxygen is measured by minutes, not by weeks. Another important fact in this connection is that more muscular action is involved in respiration than is demanded for handling any other food element, which affords additional proof of the importance of air in the dietary scheme. No matter from what source foods may be obtained, they are valueless to the human organism until thoroughly oxygenized. Many an athlete has died prematurely because the lung capacity did not keep pace with the increased demand for oxygen created by muscular development.

Of all the liquid foods, water is by far the most important, and is in addition one of the greatest of natural tonics. It is the only substance known that has the power of permeating all tissues, yet without producing any untoward effects. Few people imbibe sufficient of this important food daily. Not many people realize that the body consists (approximately) of eighty per cent of water, the balance representing the organic elements and the inorganic salts. Hence, in health, from five to six pints of water should be consumed daily to offset the amount daily excreted by the skin, the kidneys and the lungs, while in all febrile or wasting conditions, this amount should be doubled. It should be stated that pure, soft water is the only kind that should ever be taken into the system, after maturity is reached. Water contains a variety of mineral substances, usually, which entail a great amount of labor on the organs that are compelled to handle them, and unless the eliminative functions are exceedingly active, these substances are deposited by the blood on the arterial walls, inducing sclerosis.

Next in importance of food elements are the mineral matters, known as the inorganic salts. Although in the average human being they only amount to between seven and eight pounds, yet they are absolutely essential to life. Deprived of them, man could not exist a month. Most of these mineral substances are contained in the bones. Iron and phosphorus play an important part in the human economy, especially the latter, as it is indispensable to cell activity, and, besides, plays a prominent part in nerve structure. Thus we see that some of the most important food elements are those of which no cognizance is taken by the average declaimer on dietetics. The main thing to be considered in connection with food substances is their nutritive value. Many people, having heard the body compared to a steam engine, and food as fuel, jump to the conclusion that it is only necessary to pile in fuel (food) in unlimited quantity to secure the de-

sired result. A little reflection, however, or a few minutes' conversation with a practical engineer would convince them of their error. The amount of energy generated in an engine is not so much a question of quantity of fuel, as of quality, and the same is true of the human body, perfect combustion being the end desired in both instances.

The Biblical tradition, that man was formed from the dust of the earth, is undoubtedly true, in so far as that all the elements composing him came from the earth originally, while his sustenance depends upon the products of the earth, either directly or indirectly obtained. The natural deduction from this would be that all foods furnished directly from the earth would be more likely to contain the ingredients necessary to support life. This is partly substantiated by the fact that wheat (a direct earth product) is known to be one of the most perfectly balanced foods, containing in their proper proportion all the elements necessary to sustain life. Few people today seriously maintain that meat is an essential to existence; but the various methods employed in its preparation make it exceedingly palatable, and transmitted appetite is largely responsible for the hold that it has upon a large proportion of the earth's population. It is claimed that all food material taken directly from the earth, contains from twenty-five to forty-three per cent more refuse material than that indirectly obtained, which should be a conclusive argument in favor of the latter variety, considering the amount of physical energy thus wasted in the elimination of the refuse material. The question whether food should be eaten cooked or uncooked is exciting considerable attention at present, and while we admit that modern cooking leaves much to be desired, inasmuch as the methods employed frequently destroy much of its nutritive value, yet there are many edible substances which, in an uncooked state, are not adapted to the human stomach. It has never been demonstrated that cooking causes any damage to foods, and therefore it would seem the part of prudence to retain cooking. Of course, there are a number of foods, such as fruits, nuts and various salads, which are preferably eaten uncooked; but we believe that a reasonable proportion of these foods, eaten in conjunction with the others, would completely offset the (possible?) prejudicial effects of cooking.—Health.

## GETTING OUR FILL.

ONE time, after we had spent several years in college, we got tired of listening to self-made preachers every Sunday and common-sense people all week, so we took the train and went to hear a preacher of the highest world-wide fame. We wanted truth, sincerely given. We had no use for anything but truth applied to real life. After hearing this famous metropolitan preacher a few times, we went back home satisfied and willing to listen to the old self-made preachers, who had intuitively and purposely collected and refined a greater amount of soul-food than had the wonderful preacher from abroad.

Again, we say, learn to discern the truth, and rightly estimate its value, whether it comes from a pauper, a king, a noted teacher or just from your father and mother.

The INGLENOOK is after the truth.

## CREAM OF MAGAZINES

### WHERE DID YOU GET IT, GENTLEMEN?

Perhaps we shall understand more clearly the difference between flat-dweller and palace-builder if we consider impartially the history of a very successful and in some ways a typical instance of the centralizing of capital, the American Tobacco Trust.

This institution dates back to 1890, and really owes its existence to the growth of the cigarette habit that infected this country after the Centennial Exposition of 1876, when the cigarette was obligingly exhibited to us by some of our admired foreign visitors. By 1885 many houses were engaged in supplying the rapidly growing demand. These houses competed—and, in the end, extravagantly, so that none of them could make money. Five of the leading cigarette-making firms, to wit: W. Duke, Sons & Co., of Durham, N. C.; Allen & Ginter, of Richmond; Goodwin & Co., and the Kinney Tobacco Company, of New York; W. S. Kimball & Co., of Rochester, N. Y., and Oxford, N. C., met in New York in January, 1890, to consider ways of limiting competition, and stumbled upon a plan of organization, modeled upon a hundred other such combinations then and now in existence. This American Tobacco Company was launched (congenially) in New Jersey, where it put to sea January 31, 1890. Capital, \$25,000,000; assets, chiefly speculative and paper; investment, nothing,—literally nothing, for the men that formed the company did not contribute one cent of money to it.

The Trust was engaged in suppressing its competitors. Any dealer that would not help its cause it could practically ruin by refusing to sell him the goods he must have. In December, 1895, after a meeting of the directors of the American Tobacco Company, it was announced to the public that, owing to the unsatisfactory condition of the business, the usual semi-annual dividend must needs be passed. Instantly, down crashed the stock, the price declining in a few days from 117 to 63. When the stock would decline no more, the men on the inside loaded up with all of the stock they could get—at bottom prices. Soon after, the directors met and declared a cash dividend of twenty per cent and a scrip (watered stock) dividend of another twenty per cent. At this astounding news, the stock rose with a bound. Up and up it went among the stars, flying higher day by day. When it hovered at 180 or thereabouts, the men on the inside unloaded the stock they had bought at 63 and reaped large profits.

There were still left many strong competitors that would not surrender to either force or allurements, and most prominent among them was the great Liggett & Myers firm of St. Louis. Liggett & Myers had a brand of plug tobacco called "Star," which was very popular. To oppose this the Trust put forth a brand called "Battle Axe," and to push "Battle Axe" into favor and oust the "Star" the Trust lost \$1,000,000 a year. The president of the American Tobacco Company and the originator of the brilliant "Battle Axe" idea was J. B. Duke. The treasurer was George Arents, of the brokerage firm of

Arents & Young, Wall Street. Early in 1898 James R. Keene gathered certain facts in regard to the company's business and politics, and concluded that the losses had been great and unnecessary, and that if the \$1,000,000 a year "Battle Axe" drain were eliminated and the enterprise put upon a straight business basis the company could water its stock to the extent of doubling its capitalization and could still make ten per cent dividends.

### "Standard Oil" Slips In.

Mr. Keene brought in to help him Oliver H. Payne, of the Standard Oil crowd, who was William C. Whitney's brother-in-law; Herbert C. Terrell, afterward confidential attorney for the president of the Sugar Trust; and Moore & Schley. It was just before the Spanish-American War, and the whole market was depressed. Mr. Keene and his associates went quietly at their work, and so adroitly gathered in the stock that the men on the inside of the company's affairs never suspected what was happening. When the books closed and the happy gentlemen suddenly awoke to find themselves defeated and menaced with the imminent loss of their ship, the price of common stock roamed as high as \$800 for 100 shares over night—that is, for the leasing of stock for election purposes.

The Keene associates got the bulk of their stock at about 90. Their purpose was to put it up to 200 and then issue the water. Keene soon declared that some one in the Moore & Schley end of the compact was secretly selling his stock at 150 instead of holding it until it should reach 200, which was the agreement. Of course so long as insiders let their stock go at 150, it was useless to talk of putting the thing above that figure. Keene accused Moore & Schley and was in turn charged with treachery. In the end Keene threw over the whole venture. Within two days he sold all his tobacco stock for what he could get, from 147¾ down to 132½, clearing about \$1,250,000, but missing the monstrous harvests that he had expected from the stock-watering. He was out, but Payne and the Standard Oil crowd were in and stayed in, and that is where Standard Oil influence in the Tobacco Trust began. Payne had snapped up most of Keene's stock.

The capitalization of American Tobacco was doubled. Pretty soon it was still further increased. The Continental Tobacco Company was organized too and in all the plug-tobacco manufactories, except Liggett & Myers, who absolutely refused to ship under Captain Duke, various devices were adopted to swell still further the enormous capitalization without seeming to increase it, devices like the subsidiary company and the holding company. The American Snuff Company was formed to establish a monopoly in the snuff business, and the American Cigar Company to monopolize cigar-making. Every time the capital was increased, a heavier tribute was imposed upon retailer and consumer. After some years it occurred to the gentlemen in actual charge of the Trust that one source of profit had been overlooked, and thereafter the tobacco producer began to feel a steady contraction of his market and a decline of the prices that he obtained.

Meantime, Mr. Ryan and his friends had noted well the progress of the Tobacco Trust, and at the beginning of 1899 they seem to have thought that the time had come for them to participate in this good thing. Accordingly, they organized the Union Tobacco Company of New Jersey. Old friends of ours appear in the list of incorporators—Thomas F. Ryan, P. A. B. Widener, W. L. Elkins, Thomas Dolan, and R. A. C. Smith, and with gratification we may observe that the new enterprise had the sage advice and directing counsel of Elihu Root, now Secretary of State of this nation, then confidential adviser of Thomas F. Ryan.

The capital stock of the Union Tobacco Company was \$10,000,000, of which, kindly note, only \$1,350,000 was ever paid for. The news of its forming occasioned many painful moments on board Captain Duke's ship. The navigators there easily foresaw trouble. Mr. Ryan and his friends quickly found the talent necessary to embark on a large scale in the cigarette and tobacco business. Among the experienced men that they secured was William H. Butler, who had been vice-president of the American Tobacco Company and the originator of the "Sweet Caporal" cigarette. It was evident, therefore, that the Union Tobacco Company was equipped for formidable rivalry. Besides, the making and selling of tobacco was only a part of the business of the American Tobacco Company. Manufacturing was a good cover to the issuing and manipulating of securities from which the bulk of the great profits were derived, and the men in the Duke party knew very well that in the issuing and manipulating of securities the Ryan-Widener-Elkins-Root syndicate had no equals in this world; also that to such experts \$10,000,000 of capital was as good a foundation as \$100,000,000. A still greater danger lay in the proved and unequalled power of the Ryan party to influence legislation and manipulate government—a matter of the first importance to the Trust's welfare. The first moves by the Union Tobacco Company were very disconcerting. It began by operating on a bold and big scale the institution known as the subsidiary company, and showed the Duke party how much had been overlooked concerning that device. The exact method by which the subsidiary company device is worked I can show best by relating a particular instance. One of the firms that had remained outside of the Trust and continued to fight it was W. T. Blackwell & Co., of Durham, N. C., makers of smoking tobacco. The Ryan-Widener-Root syndicate bought out W. T. Blackwell & Co., for \$2,300,000. They then formed the Blackwell Tobacco Company as a subsidiary concern of the Union Tobacco Company and capitalized it at \$9,000,000. They then sold to the public at par \$6,800,000 of this stock, retaining the rest for their own purposes. The net result of this transaction was that they had secured a profit of \$4,500,000 in cash and yet had \$2,200,000 in stock. Why should any man be poor?

These operations caused additional misery to Captain Duke and his friends. In making of something out of nothing they had been enormously successful, and yet, it must be admitted, in a crude and blundering way. Opposed to them were men that had been all their lives engaged in making something from nothing and had shown in the process both finesse and industry. From the Duke ship the outlook seemed stormy indeed. Meanwhile the Ryan-Root syndicate proclaimed that it purposed to press resolutely ahead and to compete vigorously in every department of the tobacco trade. With hand upon heart, so to speak, it declared to the public that its one dear object was to combat monopoly. Before the agonized gaze of

the retail trader, groaning and sweating under the screws of the Trust, the coming of the new company was a joy unspeakable. To the persecuted consumer, who for some years had been noticing a decline in the quality of his tobacco, there showed at last a promise of relief and fair treatment. For six months or less the gentlemen on Captain Duke's quarter-deck looked into the muzzle of the pistol held by the syndicate. Then they offered to surrender. What did the syndicate want? Well, it wanted to be bought. For how much? \$10,000,000 and the control of the Trust ship. That was all. The terms were hard, but there was no other way out of the situation. A battle with the syndicate would have sunk the ship and all on board. There were too many and too big guns involved. So the Duke party agreed to the terms. They issued \$35,000,000 of additional American Tobacco stock, paid \$10,000,000 for the paper-fed Union Tobacco Company, bought the subsidiary companies that the Union gentlemen had organized, and while Captain Duke still stood at the wheel and issued orders, the new crowd studied the charts below and laid the course, and that new crowd was composed of Mr. Ryan and his friends. Probably their most remarkable achievement was their performance with Liggett & Myers. The attempted Keene mutiny had revealed the fact that Liggett & Myers would join a combination, or sell to one, opposed to the American. The Ryan-Root-Widener syndicate, acting on this hint, made up a pool of \$200,000 and with it secured an option for sixty days to purchase the Liggett & Myers business at \$11,000,000. Before the sixty days expired the American had capitulated to the Union. Thereupon the syndicate compelled the American to purchase of it the Liggett & Myers business at \$18,000,000, thereby netting a profit of \$6,800,000 on an expenditure of \$200,000.

#### \$19,000,000 in Six Months.

The profits of the syndicate in its Union Tobacco deal were stupendous. It put into the venture \$1,350,000. Besides securing control of one of the greatest profit-makers in the world, the syndicate cleared:

|                                       |              |
|---------------------------------------|--------------|
| On the Blackwell deal .....           | \$4,500,000  |
| On the Liggett & Myers deal .....     | 6,800,000    |
| On the sale of Union Tobacco Co. .... | 8,650,000    |
| Total, .....                          | \$19,950,000 |

This in less than six months, without making anything, selling anything, or developing anything; and also without effort, risk, or expenditure, except for options and the issuing of fictitious stock. No sooner was this pleasant affair concluded than the new directors of the ship began some dizzy evolutions on a broader sea.

The subsidiary company organized to control the plug trade and fight Liggett & Myers had been called the Continental Tobacco concern. It was floated in New Jersey, December 9, 1898, with \$75,000,000 capital stock, half common and half preferred, of which there was issued \$31,145,000 of preferred and \$31,146,500 of common. Its business was unsatisfactory because of the cost of fighting the firms still outside the Trust and because it was monstrously overcapitalized to start with, so that its net earnings for 1899 were only \$2,032,756, and it paid only three per cent on the preferred and nothing on the common.

The new interests in the American Tobacco Company had very good friends in Washington, for one of the remarkable features of the Ryan syndicate is the close relations it has always managed to maintain with government—city, state, and national. Of its many friends in

Washington the best seem to have been in and about the Finance Committee of the Senate, where all these matters of the revenue duties would be determined. Afterward it was learned that Senator Nelson W. Aldrich, of Rhode Island, held \$1,000,000 of tobacco stock. Very likely, therefore, he was not among the deadly or implacable enemies of the Trust. Senator Aldrich was chairman of the Finance Committee. Two other members of the Senate were also holders of tobacco stock. Very likely, too, these gentlemen were not wholly inimical to the Trust. In secret sessions the Finance Committee of the Senate determined to reduce the tobacco tax to the peace basis. It also determined to make in the revenue laws certain changes that would be greatly to the benefit of the Trust and to the disadvantage of the Trust's competitors. These were changes (difficult to make clear in this limited space) in the restrictions governing the sizes of packages, changes that had the effect of enabling the Trust to undersell makers of brands then on the market by offering larger packages for the same price.

Knowledge of these impending changes was kept a profound secret—except from the men that controlled the Trust. Immediately these men went into the market and bought all the Continental stock they could find. When they began to buy it was quoted at 12 and was inert. Unluckily, the time was short and they had no chance to work the device by which a man buys while he pretends to sell and thus keeps the price from rising. The gentlemen were compelled, for once, to buy outright, and after a time the stock began to feel the effects. The price rose to 17, 18, 20, 22,—but not before, at bottom prices, the gentlemen had secured vast loads of it.

#### A Great Something for Nothing.

They then prepared a new issue of Continental Tobacco Company bonds bearing five per cent interest. These bonds, they arranged, should be exchangeable for Continental stock. When all this was ready, out came the news from Washington that the revenue duties were to be reduced, and up bounded the prices of all tobacco stocks. But the gentlemen that managed the Trust had secured theirs beforehand, and they now proceeded to exchange the stock they had secured at 12 and thereabouts for bonds at 70, an operation in which they cleared about \$15,000,000.

Meantime, the capital stock of the American Tobacco Company, which had been \$25,000,000 in 1890, was nominally \$68,500,000 in 1900 and with the subsidiary and other companies amounted to \$200,000,000 and more. With every desire to be temperate and fair, I am obliged to say that, so far as I can discover, the creating of this colossal something from nothing had involved no risk, no effort, little or no investment, no development of any industry, no economic equivalent, and no higher type of mentality than controls the simplest operation of the smallest country store. Nor have we, by any means, seen the last of this easy fortune-making. In June, 1901, the gentlemen in control, under the pretense of extending to foreign and less favored lands the blessings of the trust principle, formed a new concern, the Consolidated Tobacco Company, and of course out came a new flood of water. The capital stock of the Consolidated Tobacco Company was \$40,000,000, and it issued \$157,378,200 of four per cent bonds, making its total capitalization nearly \$200,000,000. With these fresh tokens of something from nothing it took over the American and the Continental, giving \$100 in four per cent bonds for every \$50 of American and \$100 in four per cent bonds for every \$100 of Continental. The public tolerance being not yet exhaust-

ed, the same old game was worked again on these issues, and again the insiders, having knowledge of what was toward, picked up Continental stock in advance and added further millions to their vast hoards.

On September 9, 1904, there appeared a new American Tobacco Company, which, with another flood of water, took over the Consolidated, the Continental, the old American, and all the rest of the outfit, and again multiplied the capitalization on which the country must furnish the profits. At the present time, the total capitalization of the whole enterprise, including the dummy, subsidiary, fraudulent, decoy, alias, stool-pigeon, and other companies is about \$500,000,000, all created from \$25,000,000 of speculative and paper assets put together by Captain Duke and his friends in 1890.

As an indication of how the thing has grown, I quote figures from the American Tobacco Company alone, showing, nine years' expansion:

| Balance-Sheet Liabilities           |                |                |
|-------------------------------------|----------------|----------------|
|                                     | Dec. 31, 1897. | Dec. 31, 1906. |
| Preferred stock .....               | \$11,935,000   | \$78,689,100   |
| Common stock .....                  | 17,900,000     | 40,242,400     |
| Scrip .....                         | 3,762,340      |                |
| Six per cent bonds .....            |                | 55,208,350     |
| Four per cent bonds .....           |                | 61,052,100     |
| Profit and loss surplus .....       | 7,447,849      | 30,353,888     |
| All balance-sheet liabilities ..... | 42,289,236     | 278,628,564    |

| Balance-Sheet Assets.                      |              |             |
|--------------------------------------------|--------------|-------------|
|                                            |              |             |
| Real estate, etc. ....                     | \$ 4,009,143 | \$          |
| Patents and good-will .....                | 24,867,263   | 123,331,600 |
| Leaf tobacco and manufacturing goods ..... | 8,591,777    | 31,187,814  |
| Stock of foreign companies .....           | 1,264,655    | 21,495,085  |
| Stock of other companies .....             |              | 70,451,549  |
| Cash .....                                 | 1,538,751    | 5,163,965   |
| Bills receivable .....                     | 2,017,645    | 26,998,551  |

As for the producer, that is a still more melancholy story. From time immemorial tobacco leaf had been sold in the tobacco-raising regions at the free competition of buyers. There was never any quoted price for tobacco as there is for wheat or cotton, but the farmers brought their tobacco to market and the buyers were wont to bid for it. The Trust has changed all this, for now in a great part of the tobacco region there is but one buyer. The Trust makes the price what it pleases, and the farmer must accept this price or take his tobacco home again. Under the operation of this system, such tobacco as for years had brought in a free and open market six to eight cents a pound sells for three cents a pound or less. The land that had formerly produced \$75 to \$200 an acre now yields less than half of its former returns, and a distinguished Kentuckian has calculated that in his state, because of the operation of the Trust, the returns to the tobacco farmer are less than twenty cents a day for his labor.

In four of the countries of Europe—France, Italy, Austria, and Spain—tobacco is a government business, and these four governments buy in the United States every year about one million pounds of tobacco. The Trust arranged with the buyers for these governments that they should have a certain fixed territory in the South in which they might buy without opposition, provided they should buy nothing outside of that territory. When this arrangement was made it destroyed the last chance of competition, and gave over the producer bound to his despoiler. Against these conditions the farmers of the South have protested to Congress, to the Department of Commerce and Labor, and to the courts, for every step in the Trust's proceedings has been wholly illegal and specifically prohibited. Yet the law has never been enforced upon this Trust, nor has the government until lately given it any greater heed than is involved in some feeble, perfunctory, and quickly abandoned inquiries.—Everybody's.

# Echoes from Everywhere

## GENERAL.

In 1860, Congress granted large tracts of swamp lands in the Chippewa Reservations to Minnesota. For some time past, an effort has been made to set aside this grant on the ground that the treaty of 1857 by which the state gained the land was invalid. Secretary Garfield has ruled that the title to the land is good. This land is worth at least \$1,000,000. The proceeds of the land sales will go to the schools and state institutions.

An effort is being made to secure national aid to drain large tracts of swamp land belonging to Indians of Northern Minnesota. The land would have to be bought from the Indians and given to homesteaders who must pay the cost of the land and the drainage.

January is a busy month for Fargo, N. D. During the latter half, she has six big conventions: the Tri-State Grain and Stock Growers' Convention; the State Veterinarians; the North Dakota Live Stock Association; the State Horticultural Society; the North Dakota Poultry Association; and the North Dakota Independent Grain Shippers. The first named convention is the largest gathering of practical farmers in the United States. There are 2,000 delegates from Minnesota and the Dakotas. This is the eleventh session.

The lumber manufacturers of the west are being measured with their own meter. Last year, when prices of lumber were rising, shipments of lumber at low prices were delayed while orders which were taken later at higher prices, were being filled promptly. The delay in filling the low price orders was so great that it amounted to practical cancellation of orders. This year, since prices are falling, buyers are cancelling the high price orders in favor of low-price orders that come later. Manufacturers are not enjoying the change, and will endeavor to reach an understanding with the retail trade.

Representative Waldo has introduced a resolution in the House Committee of Foreign Affairs suggesting that the President intercede with the government of Russia for the liberation of the members of the Russian Duma now in prison or under duress within that country, and offer them an asylum in this country.

A chapel and school of the Southern Presbyterians was burned by Chinese rioters recently at Kia-hsing-fu, in the Province of Chekiang. The missionaries themselves are reported safe. In this particular district there have, for some time past, been indications of a renewal of the Boxer troubles, altho hitherto the movement had been directed against the present government rather than against foreigners.

When on Christmas Day the officers of the Minnesota gave a reception to the other officers of the fleet at Trini-

dad, almost the first thing the visitors saw was a board festooned with greens depending from the great 12-inch guns of the after turret, and inscribed with "Peace on earth; good will to men!" We do not usually think of such sentiments as current in the navy, but if the navy represents present civilization and not ancient barbarism, they certainly ought to be.

The number of immigrants arriving at New York during the first half of January was only a trifle over half of the number which arrived during January last year. The number of people leaving New York in the steerage in the first ten days of 1908 was two and a half times the number leaving in 1907. Commissioner Natchorn expects that immigration will be very small this year.

The correspondence school has hitherto limited itself to technical and secondary education. Now comes a correspondence college, whose teachers are to be university professors, giving instruction in Continental, European, English, and American history; civil government; English literature and composition, education and the history of the fine arts. The new institution will be known as the School of Liberal Arts and Sciences for Non-Residents. Among its Educational Council are Hamilton W. Mabie, of "The Outlook;" Albert Shaw, of "The Review of Reviews;" Talcott Williams, of "The Philadelphia Press;" Dr. George Hodges, of the Episcopal Theological School, Cambridge; and Edwin D. Mead, of Boston. Among the instructors are George Burton Adams and Edward G. Bourne, Professors of History at Yale; Jeremiah W. Jenks, Professor of Political Economy at Cornell; John C. Van Dyke, Professor of Art History at Rutgers; Professors William Allen Neilson and Charles R. Nutter of the English Department at Harvard; and Professor Chester Noyes Greenough, of the University of Illinois.

An organization under the title of the Model License League has been formed in Louisville, Ky., with a membership of more than 300 brewing and distilling firms, for the purpose of combatting the prohibition movement by getting saloons to observe the law strictly and so conciliate public sentiment. The Model License League would have the penalty for the first violation of the law, on the part of a saloonkeeper, a suspension of his license for thirty days. For a second offense the license would be perpetually cancelled. In order to get the saloon out of politics the League, instead of having licenses renewed annually, would make the license practically a contract between the state and the saloonkeeper, the contract to be revocable only for cause and to be transferable. They would also limit the number of saloons to one in 500 of the population. Some states already have laws on this principle. In Massachusetts the number of saloons is limited to one in 1,000 of the population. The League's plan for the revocation of the saloonkeeper's license for a second offense against the law is a good one.

### FOREIGN.

When England launched her invulnerable Dreadnought battleship Germany was not slow to profit thereby and began building three monster battleships of the deadly kind which England first gave to the world. In order to keep Germany cowed and sensible of her weakness England is now building six more vessels of the Dreadnought type, and should Germany duplicate this number it is evident that England would double her challenge again as she has just done. The present elaborate preparation for war is alarming and senseless.

Things seem to be going smoothly at Panama. Colonel Goethals reports that last month, for the first time, there was more labor obtainable than could be employed. There are now 30,000 men on the pay roll. None of the common laborers are Americans. They are all either whites from Southern Europe, or West Indian negroes. A spaniard on the average, according to Colonel Goethal, does about twice as much work as a negro. The total cost of construction he puts at \$250,000,000. Besides that we had to pay \$40,000,000 for the French rights to the old works.

President Roosevelt has decreed that United States intervention in Cuba shall cease within his term of office. He is anxious to demonstrate to the world that our help in Cuba is friendly and not prompted by avarice, or greed of power. His conclusion is commendable. We lose our original character when we imbibe the warlike spirit of Europe and hunt every opportunity for domineering over a weaker nation.

### FOUR YEARS' COURT PROCEEDINGS OVER AN INCUBATOR BABY.

Topeka, Kans., Feb. 1, 1908.—At the World's Fair in St. Louis, four years ago, a sickly infant was exhibited in an incubator. The mother was not expected to live and the baby seemed too tiny to ever grow to maturity, so that poor, sick mother was induced to sign her offspring away to a Mrs. Barclay, who had charge of an incubator display at the fair.

In a short time the mother in Topeka and the babe in the incubator in St. Louis, both began to improve and finally regained normal health. Then a battle began about the baby. Mrs. Bleakley, the real mother, wanted her offspring, but Mrs. Barclay had the infant legally assigned to her and her affections had centered in the tiny incubator baby besides. The lower courts confirmed the legal assignment of the baby, but friends of Mrs. Bleakley spirited the child away from the Barclay home and returned it to Mrs. Bleakley. The Supreme Court of Kansas, has recently awarded the child to its real mother.

The sympathy of the people are with the mother, who, in her feeble condition, was induced to give her baby away.

### TOBACCO WAR IN KENTUCKY.

Hopkinsville, Ky., Feb. 1, 1908.—The situation in the tobacco districts of Kentucky has been getting worse for two years. Ever since the great American Tobacco Company has gained control of the tobacco trade in the United States the tobacco raisers have been pinched more and more each year until the net profit per pound to the trust has become one-half as much as the farmer gets for his crop when sold. The farmers of Kentucky, where tobacco is extensively grown, effected a compact two years ago by which they aim to withhold their tobacco

from the buyers until a fair price is offered. A large part of the farmers have joined this association, and, in order to master the situation entirely, they are forcing the neutral farmers to join in with them by using foul means as well as fair. Last year the organized farmers destroyed the tobacco plants and crops of non-members, and burned the sheds in which the tobacco was hanging, but now they are torturing the body of those who will not join their association. Men are called out at night and lashed, others are tarred and feathered, while others are told to leave the country. By such means the local association is endeavoring to have every tobacco raiser join their union and hold their tobacco.

Since all of this terror is caused at night it is hard for the authorities to convict the perpetrators. What the outcome will be cannot be predicted.

### SECRETARY TAFT'S REPORT ON THE PHILIPPINES.

Washington, D. C., Jan. 28, 1908.—In his official report to Congress concerning the Philippines, Secretary Taft has advised retaining the islands and giving them a chance to learn the art of self-government under the tutoring care of Uncle Sam. He says, that had this government given the islands over to themselves a few years ago, their confusion and chaotic condition would have given some other nation a chance to come in and take perpetual control, while by our own care he thinks that in twenty years they will be ready to govern themselves. Schools, business methods, agriculture and industrial improvements all over the islands must be instituted and operated for them in order that the natives may obtain a knowledge of what civilized life and freedom demands.

If the Secretary's generous policy is adhered to, it is evident that the poor natives, who were ground down under Spanish rule, will be given a fair chance now to prove themselves worthy of a national independence.

The Secretary also advises replenishing the Catholic church in full for all the damage she sustained by the war and in having state aid withdrawn when the islands were transferred to the United States. Such a report has an evident tone of fairness and justice in it for all concerned.

Philadelphia, Pa., Feb. 1, 1908.—The Supreme Court, of Pennsylvania, has declared the 2-cent railroad fare unconstitutional. Not much hope is left that the hasty act of last year will stand the test in any state. Railway employees are beginning to petition legislators in many states to repeal the law in the hope that their wages will be advanced to former prices. Test cases will be made by the railroads in other states, and the prediction is that the 2-cent legislation of last year will soon be a matter of ancient history.

### WANT AND EXCHANGE

To accommodate some of our readers and bring them in closer touch with each other, we have opened this "want and exchange" column.

Rates, twenty-five cents per insertion, not exceeding four lines, including name and address. Five cents per line for additional lines. However, no "want" may exceed six lines altogether.

WANTED.—To enlarge, or copy, pictures for Inglenook readers. Send me any of your favorite pictures and I will make you a 16 in. x 20 in. picture exactly like the original for \$1.50.—W. J. King, West Lafayette, Ohio.

# Matthew Henry Commentary on the Bible

Catalogue Price, \$15.00  
Our Special Price,

1. o. b. Elgin, Only

**\$7.95**

We have reduced the price of this commentary until it is within the reach of all. Every minister and Bible student who does not already have a set of these books ought to take advantage of this special offer. Better send your order at once.

**BRETHREN PUBLISHING HOUSE**  
Elgin, Illinois

Self-Explanatory

## BIBLE

The Old and New Testament with introduction and notes. Also harmony of the Gospels and outline of the Life of Christ.

It is printed in large clear type, and the notes follow at the bottom of each page, giving a brief yet comprehensive explanation of the text. It is a practical commentary with the complete text all in one volume.

Description

It is printed on good Bible paper, bound in Arabian Morocco, full leather lined, silk sewed, head band and marker, divinity circuit, red under gold edges, size 6x9¾ inches.

Price, prepaid, .....\$5.00

Special

We have one copy, slightly shelf-worn that we will send prepaid to the party who applies first for only, .....\$3.25

**BRETHREN PUBLISHING HOUSE,**  
Elgin, Ill.

ALWAYS MENTION THE INGLENOOK WHEN ANSWERING ADVERTISEMENTS.

## FREE SAMPLE

Send letter or postal for free **SAMPLE HINDOO TOBACCO HABIT CURE**  
We cure you of chewing and smoking for 50c., or money back. Guaranteed perfectly harmless. Address Milford Drug Co., Milford, Indiana. We answer all letters.

## EUREKA INDESTRUCTIBLE POST

**FILED POST** Cheap as cedar. Made where used. Great inducements to agents. Address, with stamp, W. A. DICKEY, North Manchester, Ind.

## FOR SALE

Forty acres of level land, with new, two-room cottage, well, cellar and barn. Three-quarters of a mile west of town of Macdoel, on the C. N.-E. Ry; S. P. system, in the famous Butte Valley, Northern California.

On account of change of business owner will sell for \$35 per acre.

For further information address,

C. H. MASSIE,  
801 Union Trust Bldg.,  
San Francisco, Cal.

## PROBLEMS of PULPIT and PLATFORM

By D. D. Culler

In this book the author discusses some of the most important problems of public speaking. A few of the subjects discussed are:

Forecast for Public Speaking.  
The Speaker as Blood and Brawn.  
The Voice in Public Speaking.  
The Audience.  
The Discourse.  
Style in Discourse, etc., etc.

The book will be found very helpful to all public speakers or any one interested in this line of work.

Price to Ministers of Brethren church, prepaid, .....12 cents  
Regular price, prepaid, .....75 cents

**BRETHREN PUBLISHING HOUSE,**  
Elgin, Ill.

## 1908 ALMANAC

Our Brethren Family Almanac for 1908 is now ready for mailing. It contains a number of very interesting biographies of prominent men of the Brethren church of the last century. This will make the Almanac of this year of more than ordinary interest.

### AGENTS

who have not already done so, should order copies at once to supply the non-members in their territory who would be interested in the Almanac. With a little effort each agent will be able to place a number of them in homes where they will do good.

Price, per single copy, .....10 cents  
Price, per dozen, .....50 cents

**BRETHREN PUBLISHING HOUSE,**  
Elgin, Ill.

Is this your picture, Mother, Sister? Is your Nervous System broken down and you can hardly drag along? Brawntawns, The Victor Tonic, was made for you as it builds broken-down systems, restores appetites, strengthens the digestive organs. If you have tried other tonics don't despair until you try Brawntawns, The Victor Tonic, for it will build you. Thirty days' treatment delivered to your home for 50c.

Address

**B, VICTOR REMEDIES CO.**

## LOMITA, CALIFORNIA

1. Situated four miles from the ocean, and near San Pedro Harbor. Rich soil, excellent natural drainage. Can grow crops 12 months in the year.

2. Three wells of soft water for irrigation and domestic purposes. Water piped to each one's land. Settlers to own all water systems.

3. Natural gas comes up with water, and is used in engine to pump the water, making the expense of lifting quite nominal. Gas leaves the water on reaching the air, hence pure water.

4. Markets at the front door and back door; land and water transportation to all the world.

5. Grain and corn raised without irrigation. Crops from October to May, barley, oats, wheat, onions, cabbage, beets, peas, cauliflower, radishes, citrus and deciduous fruits, nuts, and vegetables in their seasons. Government analysis of soils shows much of this land very fine for oranges and lemons.

6. Six lots donated for German Baptist Brethren church. Good opening for business. No saloons, no pool rooms can be operated on these lands.

7. All kinds of produce bring good prices, at San Pedro Harbor and Los Angeles. Profits from \$100. to \$500 per acre per year. Settlers arriving right along. This colony sure of success, as it has the soil, the water, markets, the push and a twelve months' climate to grow useful things.

Address:

**W. I. HOLLINGSWORTH & CO.,**  
314-316 Wilcox Bldg., Los Angeles, Cal.  
M. M. ESHELMAN,  
E. E. No. 2, Gardena, Cal.

## Ropp's New Commercial Calculator and Short Cut Arithmetic

The Standard for Store, Farm, Bank or Factory,

5 1/4 x 2 3/4 in.

Is from beginning to end a greatly improved, enlarged and thoroughly revised publication.

It contains an entirely new system of unique Tables, Short-Cuts and up-to-date Methods.

It is unquestionably the most complete, useful and comprehensive Calculator ever published.

It has more than twice the matter, scope and capacity of Ropp's former editions, of which

**Nearly 1,500,000 Copies have been Sold.**

It is the most convenient and practical Labor-saving work ever used in the business world.

It will make every one independent, sure and self-reliant in all practical calculations.

It will prevent mistakes, relieve the mind, save time and labor, and often loss and trouble.

Its Tables are adapted to all the trades and occupations in the city and country, and

### Show the Answer as Quickly as a Watch Shows the Time.

It also explains and simplifies the principles of Arithmetic, Mechanics and Mensuration.

It will make the study and use of Figures easy and interesting for young and old.

It will enable every progressive mind to become an expert, sure and rapid calculator.

It will prove a boon to all whose education in arithmetic has been limited or neglected.

#### 48 Cuts Illustrate the Elements of Mechanics and Mensuration

It defines about 70 points in "Commercial Law" which every man and woman should know.

It is the result of devising, and improving system after system; of spending thousands of dollars in experimenting; of making millions of miscellaneous calculations, and of doing some vigorous thinking during 38 years, by an analytic, practical and persevering mind.

### It is Especially Designed for

Farmers, Mechanics, Business and Professional men,

Office Edition (9 1/2 x 5 1/4 in.)

## Post Cards

A Choice Variety of Designs.

Post cards have come to stay. They are more popular today than ever. They can be used in so many ways as a remembrance. Since one-half of address side can be used for writing they are all the more useful. Buy from the following numbers and you will order again.

No. 11. Brethren Publishing House. Price, per doz., .....15 cents

No. 21. Elgin Views. Pictures of the most important views in Elgin, such as Watch Factory, Park Scenes, etc., in rich colors.

Price, per pack of four, .....10 cents  
Per set of 9 designs, .....20 cents

No. 31. Foreign Views. Beautiful colored views from foreign countries, such as Italy, France, Egypt, Switzerland, Germany, etc. Each card gives a brief description of the picture it contains.

Price, per pack of 4, assorted designs, .....10 cents

Price, per pack of 12, assorted designs, .....25 cents

No. 61. American Views. This number contains no two cards that are exactly alike. They are finely colored and all are original views taken from the most prominent places and objects in the West. They are very fine and if you order once, you will order again.

Price, per pack of four, .....10 cents

Price, per pack of twelve, .....25 cents

No. 101. Lord's Prayer. Each of the eight cards making up this set illustrates some part of the Lord's Prayer. The first card contains "Our Father Which Art in Heaven," with an appropriate illustration of same, and so on through the entire prayer. All are beautifully embossed in colors and make a unique and impressive set.

Price, per set of eight, .....20 cents

## Olive Branch of Peace

### Valuable Contribution.

Dear Brother Hays: I have ordered a copy of your book, "The Olive Branch," and have read it with exceeding interest. It is a valuable piece of contribution, not only to the history of the Valley of Virginia, but also to the history of the Brethren Church and other peace loving societies of God's people. Especially is it valuable as a clear and full statement to the world of what the world is coming more and more to recognize as just, reasonable, and desirable—Peace, and the spirit of Christian peace. I pray and believe that by means of this book, "The fruit of righteousness is sown in peace of them that make peace."

Yours fraternally,

John W. Wayland.

University of Virginia, Charlottesville, Va., Oct. 29, 1907.

This book contains 232 pages, has a number of illustrations and is well bound in cloth.

Price prepaid, .....75 cents

### AGENTS WANTED.

We want an active agent in each congregation to push the sale of this valuable book. It should be in the hands of all of our people. If there is not an agent pushing the sale of this book in your congregation, and you could spare some time for this work, write us for terms. Do it now.

BRETHREN PUB. HOUSE,  
Elgin, Illinois.

Postpaid on Receipt of Price. Address,

BRETHREN PUBLISHING HOUSE,  
Elgin, Illinois.

Vest Pocket size, 2¾x5¾ in. and ¼ in. thick.

# ALBERTA

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the Brethren already there and enjoy some of the material benefits as well as help build up one of the largest Brethren Colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

¶ For particulars and cheap rates apply to

## BUTTE VALLEY CALIFORNIA

and

## ROGUE RIVER VALLEY OREGON

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

### TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

### DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

### DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

# Echoes from the West

Messrs. D. C. Campbell and Isaiah Wheeler brought a party of thirteen to Butte Valley from the middle west on the 19th of January. They report that they will leave Chicago on March 3, with a large party to join a larger one from Duluth, Minn., in care of Mr. E. T. Merritt, at Omaha. A special rate of \$38.00 will be made. If any others are contemplating joining this party they should notify George McDonaugh, Omaha, Nebr.

A farmers' meeting was held on the 23rd, in Macdoel, for the purpose of discovering ways and means of procuring pure seed and grain, such as oats, wheat, barley, Canadian field peas, and other seeds. The farmers are to be commended for their efforts to prevent the invasion of obnoxious weeds. More than 5000 acres of sage brush is doomed to be laid low this spring, and farmers have been already plowing for five or six weeks.

Last week was a record breaker in bringing new settlers into Butte Valley. The gentlemen from the east are not the only immigration agents that are settling up the valley. Dr. W. S. Campbell is not a duly authorized agent of the Butte Valley Land Company, yet he presented to Mr. and Mrs. Phillips and Mr. and Mrs. Allen, and Mr. and Mrs. Messick, each a son, and these new arrivals promise to be permanent settlers in Butte Valley.

Brant Cook has just finished a fine barn, 40x40. Mr. Cook is a very energetic man and will set a pace that will be hard for some of the others to follow.

Mr. and Mrs. Arley Hayes have just moved into their new house.

Mr. Hubbard is now employed by H. E. Maust; Mr. Williams Ormsby is employed by Grant Cook; Mr. Preston Mine is employed at the sawmill of B. M. Snider and Sons. These parties are all new arrivals from the east. People who want work can get it.

D. M. Snider has made some splendid improvements on his sawmill, and will be able to furnish the people with seasoned lumber very soon.

Mr. Boyer, recently from Iowa, who is an experienced fruit man, is employed by M. D. Early in setting out a large commercial apple orchard on his farm near Macdoel. Mr. Boyer will also plant a similar orchard for Mr. H. F. Maust.

O. N. Moore shot a gray eagle, a few days ago, which measured 7 feet 5 inches from tip to tip.

The large camp of railroad employes, located in Macdoel, will soon complete their work and move toward Doris. The sound of the whistle of the locomotive will be heard in our streets in a few days.

A few days ago a small tract of land, adjoining Macdoel, exchanged hands at \$150.00 per acre.

Mr. Holzhauser, of Sams Neck, has been at Macdoel for the last few days superintending some work for the county.

Miss Margaret Rothenberger, recently from Mulberry, Indiana, has been employed as chief cook at Hotel Macdoel. The Hotel has been crowded to the limit for some time.

Mr. White of the Weed Lumber Company is in the Valley, and reports that arrangements have been completed to install a large lumber yard at Macdoel, as soon as the railroad is able to deliver the lumber. This will enable settlers to secure building material immediately.

N. R. Graves, of Elgin, Illinois, has opened a barber shop in Macdoel.

Mr. W. H. McDoel, president of the Monon Railroad, and president of the Butte Valley Land Company, as well, is expected in Macdoel in his private car just as quickly as the track is laid to our station.

# A Common Trouble

"My watch doesn't keep time," is a common complaint which we hear in everyday life. The time-piece is either too fast or too slow or it stops going altogether. The usual remedy is sought. We rush it to the watch-maker and that worthy finds, on examination that one of the tiny, tiny wheels is clogged up by a wee speck of dust. That is the cause of the whole trouble. After the watch has been cleaned, it keeps correct time again.

We are not far out of the way when we compare the human body with its intricate mechanism to that wonderful creation of human skill—the watch. It will perform its functions regularly, only when all its parts are in perfect working order. The main spring, the heart, must beat regularly; the cog wheels, the kidneys, must not be clogged up with waste and refuse matter which the body seeks to throw off. In fact, all of its parts must work in natural harmony, then the watch, the human body, will also keep time and tick merrily the tune of health.

There are many ailments of the human body which, like the speck of dust in the watch, are looked upon as mere trifles but which exert a far-reaching effect on the human system. Take for instance such a common ailment as constipation. Very few people who are troubled with it, give it any serious thought and yet it is frequently the foundation of many serious ailments. Most people allow the trouble to run on until they are absolutely obliged to seek a remedy. They will take these so-called "cathartics" which are advertised at every corner, and learn, only too late, that these harsh, and forceful physics, are but augmenting the difficulty, if not creating a distinct disorder of the intestines. People should remember that there are any number of crude and violent drugs on the market that can be had at a few cents a pound, which, when taken, will evacuate the bowels, but no conscientious physician will recommend their use, as they are, even when administered in small doses, too severe and drastic. They are apt to cause injury by irritating the mucous membrane of the stomach and intestines.

Many people are troubled with constipation, even young children suffer from it, but it is more prevalent with people in advanced years, when the digestive secretions are less abundant. What is needed in such cases is a mild, yet invigorating remedy, which will tone and stimulate the digestive organs to natural activity in producing the necessary secretions. You would not think of taking your watch to a blacksmith when it is out of repair; why not, therefore, use care in selecting a remedy, when you are sick and ailing?

Dr. Peter's Blood Vitalizer exerts a marked beneficial influence on the digestive organs. It is not a physic, but a gentle, soothing laxative and invigorator.

## THE DOCTOR SAW THE BOTTLE.

Salina, Kans., July 6, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—Kindly send me another dozen bottles of the **Blood Vitalizer** as soon as possible. Not having used the **Blood Vitalizer** personally I have heretofore not been able to say much about it. This spring, however, I became very sick and thought I would try the **Blood Vitalizer**. My children in the meantime were greatly alarmed at my condition and sent for the doctor of their own accord. When the doctor came he, of course, saw the bottle of **Blood Vitalizer**. I thought surely he would order me not to take it, but to my surprise he told me to take it regularly, as he had noticed its good effect on the blood. Now I am strong and well and can cheerfully recommend the **Blood Vitalizer** as the best remedy I know of.

Your obedient servant,

Mrs. Aug. Hedquist.

N. B.—It is gratifying to find, at times, physicians who are broad-minded enough to lift themselves above professional prejudice and recognize merit even in a plain household remedy.

## AN AGENT WRITES.

Garrett, Pa., June 28, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs, Everybody is using the **Blood Vitalizer** with

grand success. Mrs. Phinice of this place had spent over \$300.00 on doctors and medicines without help. I supplied the **Blood Vitalizer** to her and it cured her stomach trouble.

Mrs. Werner of Meyersdale was treated by three doctors without relief. She had rheumatism and kidney trouble. Three bottles of the **Blood Vitalizer** cured her.

Mrs. Smith and son of Glencoe used it for the after-effects of typhoid fever. The **Blood Vitalizer** restored them. Mrs. Shrook of Meyersdale and Mrs. Herwig of Garrett used the **Blood Vitalizer** for neuralgia and La Grippe with splendid results. Mrs. Shoemaker of Fairhope used it for dropsy. Mrs. Haer and Mrs. Mitchell and others also used it with great success. We are enthusiastic over the results.

Yours truly,

Susan Christner.

## THEIR FATHERS USED IT.

Hartville, Ohio, Feb. 4, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs: The last box of **Blood Vitalizer** went in a hurry; for that reason I am sending in a new order. I sold the last I had today. Please ship as soon as possible.

Everyone who has used the **Blood Vitalizer** says it is doing lots of good. They say they will not do without it in the house. I am getting many new customers, also some that used it twenty years ago. Their fathers kept it as a family medicine in their childhood days, and they say they have not forgotten it.

Yours very truly,

H. D. Brumbaugh.

For further testimonials and particulars regarding this old herb remedy, send for paper and pamphlet which is sent free to everybody. It tells the interesting narrative of its discovery over one hundred years ago. Remember, DR. PETER'S BLOOD VITALIZER is not a drugstore medicine; not an article of commercial traffic. It is supplied to the people direct by specially appointed agents.

Address,

**Dr. Peter Fahrney & Sons Co.**

112-118 South Hoyne Avenue

Chicago, Ill.

# RAISIN CITY COLONY

## Procrastination is the Thief of Time

Don't wait a year and then pay \$100 per acre for land that you can buy now at \$40.

Buy you a home in our "RAISIN CITY COLONY" and live happy in the land of SUNSHINE and FLOWERS.

Postoffice is established with A. W. Vaniman Postmaster. The Hotel is now completed and doing a prosperous business. Raisin City Lumber Company has a large stock of Lumber and is doing a flourishing business.

RAISIN CITY is located on the Southern Pacific Railroad, 14 miles from Fresno, a city of 25,000.

### DAIRYING AND STOCK RAISING.

This land is especially adapted to dairying and stock raising as it is the home of the alfalfa.

### RAISINS, PEACHES AND FIGS.

Fresno County, in which RAISIN CITY is located is the greatest fruit producing county in the world, 80,000 acres in grapes.

### SOIL AND WATER.

The soil is a rich, sandy loam; the land is generally level and ready for the plow; and abundance of good water.

### PRICES AND TERMS.

We are selling the land at from \$25 to \$50 per acre on 4 years time at 6 per cent.

## D. GENSINGER, THE LAND MAN, WENATCHEE, WASHINGTON

---

(Continued from last week.)

Churches.—The same thing is true in the line of churches. It seemed very odd to us when we first attended the Brethren church at Sunnyslope (four miles north of Wenatchee) to see the number of people walking to church like in town. The Brethren there have a good, large house and they claim a membership of 128. A new church will be organized on the newly settled lands on the east side of the Columbia River in the spring. The East Wenatchee Land Company has donated the ground and we understand has agreed to contribute a considerable sum in cash to assist in building. This company (while their prices seem high to some) sell their land on such liberal terms that anyone with a little down money can buy and make the land pay out. They sell at \$250 per acre, one-fifth down, the balance on or before five years with 8 per cent interest. They have their land listed with all the real estate men in town. All are charged the same price. These prices for raw land, including perpetual water, seem to many extremely high, but if you will carefully consider what I have told you, and take your pencil and figure a little with me, you will see the price is not too high. Suppose you plant 80 apple trees to the acre, and at seven to eight years, if they will have had good care, they will yield ten boxes to the tree or 800 to the acre. At \$1.00 a box you have \$800. Now at one-half this amount for expenses of picking, packing, pruning, spraying, etc., and you still have \$400. This is 20 per cent on a valuation of \$2,000, 10 per cent on \$4,000, 5 per cent on \$8,000. Now suppose you get \$2.00 a box and you have 120 per cent (the second dollar is all net and counts 100 per cent.) At \$2.50 per box you would have 170 per cent profit on a valuation of \$2,000, 85 per cent on \$4,000, etc. Now it is a fact that these prices have been paid at our warehouses in the season of 1907 and it is also a fact that at Hood River, Oregon, \$3.25 was paid in 1906. Then it is also a fact that full grown trees frequently yield 20 to 60 boxes in a single season. With these facts and all the foregoing well understood, the price will not seem so high. Again, you can come right here and be thoroughly convinced that land has sold repeatedly for \$2,000 and upwards per acre, and that yields

of \$2,000 per acre are common. Then any investment that will pay 10 per cent is considered good, so we can reduce the above estimate and figures quite a bit and yet have a good proposition.

A Few Statements and Testimonials Showing What Has Been Done.—Our Brethren came here in 1903, bought sagebrush land at \$150, and recently one brother sold out for \$1,050 per acre. One brother holds his at \$2,000 per acre. Brother Penrod, of Iowa, came here in October, 1906, bought ten acres for \$10,500. Well, some thought he was losing his mind, but in less than three months he was offered \$12,500 for it, and recently \$16,000 and upward. It is all planted to peaches, two years old. Sales near town are common at \$2,000 per acre. Charles Cooper reports \$3,000 worth of Winesap apples per acre from eight year old trees in 1907. William Turner reports \$20,000 from his 20-acre orchard of eight year old trees. From North Yakima comes a report that \$3,500 worth of pears were harvested from three-fourths of an acre, trees seventeen years old. J. T. Tedford reports \$1,400 worth of cantaloupes from three acres in 1906.

This will give you a good idea as to conditions and what is being done in the Wenatchee valley. Compare with your present opportunity, or any other, and you will decide in favor of Wenatchee Valley. The homeseeker and eastern man will find great opportunities here. When we hear our brethren and friends of the east tell how their farms only pay 4 to 6 per cent on the valuation and that money is only worth 4 to 6 per cent, we feel that they ought to take advantage of this last great west. Come and see us. Keep up your investigation. Go where you make the most money on the increase of the valuation of your land. If you are a renter, by all means (as soon as you can) buy and own your land, and get the advantage of the increase in value. This will help you to get started. If you have money that is not drawing you a satisfactory rate of interest, by all means investigate what I have said to you. Banks as a rule are unsafe. You can invest your money where it is absolutely safe and will pay you a much higher rate of interest. It can be done without you coming here if you like. I make investments and loan money for non residents. For any other information write me.

# Possibilities of IDAHO

## Unlimited

Many settlers are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for young and old of small means to get good comfortable homes with a splendid income.

### Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

## Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

## Realize \$1,000.00 Per Acre

### Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

### Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

## HOMESEEKERS' ROUND TRIP TICKETS

Will be in effect in the Spring of 1908

Colonists' one-way rates in effect from March 1, to April 30, 1908

Write for information.

## The Star-Worshippers of Mesopotamia

Effie V. Long

IN the towns on the lower Euphrates and Tigris, dwell an interesting people. We stopped a few minutes in Amara and spent a week in Busrah, their chief towns. They are known as Sabeans, Nasorians, or St. John Christians. They number about four or five thousand and call themselves Mandaean. They have dwelt among the Jews, Christians, and Moslems for centuries, and yet they have remained a separate and distinct people. One author calls them Christians of St. John; another says, "They can in no sense be called Christians," while Dr. Colville at Bagdad, thinks their religion "a bastard form of Christianity, interesting mainly as an instance of the survival of the Christian tradition in Arabia."

The Sabeans have a creed and even a language of their own and they are proud of their "separateness," neither intermarrying with others, nor accepting a proselyte to their faith. Their language very much resembles the Syriac, but it has an alphabet and a grammar distinct from that. It is called Mandaic. Few can read or write their own language, though all speak it in their homes; and from a religious standpoint they refuse to teach any one outside their faith even one lesson, unless it may perhaps be in secret.

Nearly all of these people follow one of these three trades,—dairying, canoe-making, or silversmithing. They produce the finest dairy products in Mesopotamia, and make napkin rings, thimbles, etc., of gold or silver, with black metal inlaid. Their articles are very pretty and the secret of making them seems to be kept by these people. They are quiet, peaceable and industrious, though poor. "Both men and women have a remarkably fine physique; tall, of dark complexion, good features, and with long, black beards; some of the men are typical patriarchs, even as we imagine Abraham who left their present country for Haran." Their women go unveiled, an exception for an eastern country, and on feast days all dress in pure white.

The Star-worshippers keep their religious practices a secret, and it is difficult to find out what they really do believe and practice. All that the Christians and

Moslems who live among them, know, is that "they turn to the North Star when they pray, and baptize every Sunday." But an Englishman, in some way, got a knowledge of their religion and published an article on it in a London paper. When a missionary read and translated it to them they were dumfounded that an "outsider" should know so much about their religion. What follows concerning their special feast, is gleaned from the article, "A prayer meeting of the Star-worshippers."

These St. John Christians have no permanent house of worship, but make an improvised one of reeds, for their special service on the last day of the year. In the center of this is made an altar of beaten earth. On one side is placed a hand mill, on the other a little stove. In one corner a tank about eight feet in diameter is excavated and filled with river water. About midnight as the people assemble, they disrobe, one by one, and bathe or baptize themselves in the pool of water, the priest standing by and pronouncing over each one, "The name of the living one, the name of the living word, be remembered upon thee." As each one emerges from the water he robes himself in the pure white garments peculiar to the Star-worshippers, and in which he is also to be buried. He believes that in these very clothes he is to appear in judgment.

The ceremony is all at night and when the pointers of the Dipper indicate midnight, those who have been stationed at the door to watch, wave their lamps which is the signal for the priest's coming. The spiritual leader of the sect who is elected by the other priests, has completely renounced the world, and is regarded as having died and living in the realms of the blest. Four deacons escort him. One carries a wooden cross; another, their religious book, called "The Great Order"; another deacon has a cage with two pigeons, and the last has some barley and sesame seeds. As this procession passes in through the crowd of worshippers, seated on the ground, they bend and kiss the robe of the priest who has renounced the world. He is called the Ganzivro.

The tent or meeting place has no roof but is open to the sky, and the Ganzivro stands in front of the altar looking toward the North Star, Polaris. A deacon gives him one of the pigeons from the cage, and he, fixing his gaze on, and extending his hands toward the North Star, lets the bird fly away, calling aloud "In the name of the living one, blessed be the primitive light, the Divinely selfcreated." At this the worshipers rise and prostrate themselves on the ground toward the North Star, on which they have meanwhile been gazing.

The senior priest now takes the Ganzivro's place by the altar and begins reading in a monotonous voice, from the sacred book, Sidra Rabba, occasionally ending in a loud "Blessed be thy name, O source of life," which the worshipers repeat with bowed heads, covering their eyes with their hands.

While the reading is in progress two priests are preparing their communion, or "high mystery," as they call it. One kindles a charcoal fire in the little earthen stove, while another grinds some barley meal on the hand mill. He then presses some oil from the sesame seeds, and makes the barley into small cakes, the size of a coin. These are quickly baked in the oven, the reading and chanting going on meanwhile. Another priest takes the remaining pigeon and quickly cuts its throat with a sharp knife, so that no blood be lost. The little cakes are brought to him and he stretches the neck of the dying bird over them so that four drops fall on each one in the form of a cross. The two priests who prepared the cakes then carry them around to the worshipers, and they themselves pop them into the mouths of each communicant, saying, "Marked be thou with the mark of the living one." The deacons then dig a hole behind the altar and bury the dead pigeon.

During the whole ceremony their eyes are fixed on Polaris and all the prayers are offered toward it. Before morning dawns, when the North Star begins to fade, a sheep is led into the tabernacle, laid upon reeds in a certain position and, the holy Ganzivro, bathing his hands and feet, takes a sharp knife and saying, while bowing to the Star, "In the name of Alaha, Ptahiel created thee, Hibel Sivo permitted thee, and it is I who slay thee," cuts the sheep's throat. It is then cut up and distributed to the worshipers, with the words, "The benison of the living one attend thee." Then before the sun peeps above the horizon all quietly return to their homes. So ends the feast.

The comments of Mr. Zwemer on this prayermeeting, are interesting: "What a mosaic of ceremonies and what a mixed cult is this river bank prayermeeting! The Sabeans of Amara tell me that every minute particular is correctly described, and yet themselves do not furnish the clue to the maze. Here one sees Judaism, Islam and Christianity, as it were engrafted on

one old Chaldean trunk. Gnosticism, star-worship, baptisms, love-feast, sacrifice, ornithomancy and what not in one confusion. The pigeon sacrifice closely corresponds outwardly to that of the Mosaic law concerning the cleansing of a leper and his belongings and is perhaps borrowed from that source. But how Anti-Jewish is the partaking of blood and the star-worship. The cross of blood seems a Christian element, as does also the communion of bread, but from a New Testament standpoint this is in discord with all that precedes."

Sabeanism is a book religion and it is said that they have such a mass of sacred literature that very few people have had the patience to examine even a part of it. They have a triad of gods and from these issue a number of deities, the chief being Primal Life who is invoked at the beginning of their prayers. Also there are a number of rulers for the under world.

The Sabeans regard all the Old Testament saints with the exception of Abel and Seth, as false prophets. They claim to be descendants of the Egyptians, who had the true religion. Jesus Christ (Ytshu Mashiha) was also a false prophet, being really an incarnation of the planet Mercury. But John Baptist was a true incarnation, appearing forty-two years before Jesus Christ, and while administering baptism in the Jordan, baptized Jesus by mistake. They say that about 200 A. D. their center or stronghold was in Damascus. At the time of Mohammed, who was the last false prophet, they were so prosperous as to have four hundred places of worship in Babylonia. Now there are four or five thousand communicants, all told. There are six great yearly feasts—one celebrating the drowning of Pharaoh's army. At another, observed in summer, all Sabeans are baptized by sprinkling three times a day for five days. Their moral code is that of the Old Testament. Polygamy is allowed, though seldom practiced. They do not circumcise. They are very friendly to Christians and claim to be closely related to them because they honor John the Baptist; also denying that they regard Jesus as a false prophet.

After all, they are a queer people and with all their mass of religious books, they are following, blindly, a religion, many practices of which they do not understand themselves. They are still ignorant of the Way, the Truth and the Life.

*Jalalpor, Surat, India.*

A MAN who has no faith in himself is a coward, and fear is the only devil that impedes progress in this world.

To be seventy years young is something far more cheerful and hopeful than to be forty years old.—*Oliver Wendell Holmes.*

## Big Canals and Long Railroads

Not only in the United States is the fever of gigantic internal improvements raging, but other countries have in contemplation some canals and railroad enterprises which will equal anything Uncle Sam ever did.

We see the hand of a kind Providence in this movement toward bettering physical conditions rather than making this earth a theater for bloodshed. If all the mental efforts and expenses of past ages had been spent in charitable and practical scientific channels, no one

living could guess how much farther along all nations would be in intelligence and goodness.

The world now has nine great ship canals, all of which have been constructed during the last seventy-five years; but probably more than this number will be built in the next seventy-five, for the railroads are unable to handle all the vast products of a great commercial age. Florida is attempting a canal system from Jacksonville to Key West; New York has decided upon a bond issue of \$100,000,000 for the Erie Canal; and in the West and South other canal projects are ripening. At various times from 1676 down to the present there has been talk of a canal across Cape Cod. Twenty-five per cent of the wrecks that occur on the east coast of the country take place in this region. Even wild old Cape Hatteras off Pamlico Sound has not claimed so many victims.

Last June the contract for this canal across Cape Cod was awarded to the Cape Cod Construction Co., on a bid of \$11,990,000. The length will be really twelve miles, eight of which must be cut across the cape and four dredged in the two bays. The depth must be twenty-five feet at low water; the width on the surface two hundred feet and on the bottom one hundred feet. What this is going to mean to the shipping interests may be suggested when it is recalled that it takes about fifteen hours to go around Cape Cod

and that many more than 30,000 vessels go around it annually. According to the government statistics each year about 24,000,000 tons of coal, lumber, cement, etc., pass this coast. The time will be reduced between Boston and New York, by half a day.

Since beginning the Panama Canal, those responsible for its completion have found it a larger task than anticipated at first. According to the first estimate \$135,000,000 would put the canal in working order, but now \$150,000,000 more is said to be necessary. We might as well say \$500,000,000 to start with and not mince words about it. This canal is necessary for the development of American commerce, hence the cost in dollars and cents is not to be considered. The Suez Canal cost several times its original estimate, but has paid for itself many times over in more ways than one.

There are some important railroad schemes being talked up now, which also affect international life. A railway that would make the Suez Canal obsolete by providing a shorter route to India would bring a disturbing factor into the politics and trade of Europe that might upset present balances of power and commerce. Such a railway is seen by the European press

ROUTE OF THE NEW SHORT CUT TO INDIA.

From Constantinople to India Under the German Flag—If England Permits.

in Germany's projected road from Constantinople to the head of the Persian Gulf. How far it has already been built may be seen from the appended map. The history of this work of engineering has had many vicissitudes. When in 1899 a convention of the Powers at Constantinople placed the construction of the line in the hands of the Germans the London *Times* remarked that there was no power into whose hands

Englishmen would more gladly see the enterprise fall. But circumstances changes the opinion of England and France. Each discovered interests. England owns the Suez Canal and has heavy interests in Persia. This railroad would affect her at both points.

"Seventeen hundred miles of railroad; \$100,000,000 worth of bonds to be issued, representing the value of rails, locomotives, bridges, tunnels, and other works of engineering; the consolidation of the Ottoman Empire; ancient Babylon resuscitated; a new Egypt rising amid fields of wheat and cotton on the banks of the Tigris and Euphrates; the route to India changed and the Suez Canal deprived of its supreme military and commercial importance. Such, in its main fea-

tracts, and to have a hand in the management and direction of the line."

The attached cut illustrates another British interest of international importance in Africa which was quietly, yet persistently, carried on for nearly a generation before the outside world saw any remarkable value about the enterprise. Already over one-fourth of the road is completed and profiles and finances are in sight for the remaining distance. Mr. Beit, partner to Cecil Rhodes, and a loyal British subject, left \$7,500,000 for this transcontinental road, which, when completed, will give England rightful and peaceable control of half of Africa, and a royalty on the other half.

DURING the recent financial stress the men to whom the country looked for deliverance were not noted as being either comedians or pessimists.

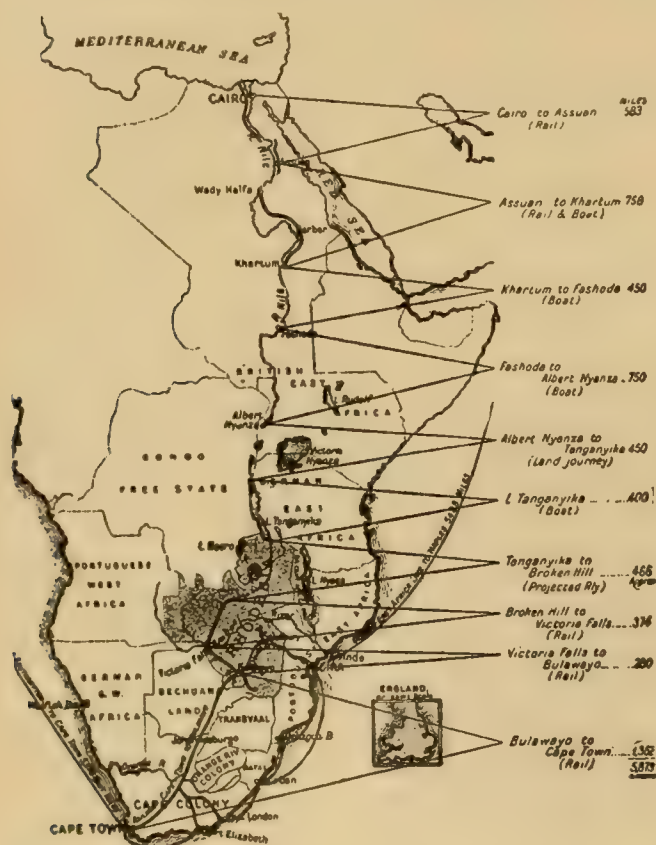

LIES that are two-thirds truth are the ones that do the most mischief.

#### Railway Accidents During 1907.

The report of the Interstate Commerce Commission shows that the railroads of the country killed five thousand passengers and employees last year and injured more than seventy-six thousand. Only three years ago, in 1904, the number of the killed was but 3,787; the number of the injured being 51,343, an increase which speaks for itself. The number of passengers killed last year was 647. The complete figures for 1906 show that 10,618 persons were killed and 97,706 were injured in that year, the figures including the trespassers and others who were neither passengers nor employees and are not included in the statistics for 1907. The figures show that in 1906 one employee in every 387 was killed and one employee in every twenty was injured. With regard to trainmen—that is, engineers, firemen, conductors, and other trainmen—it appears that one trainman was killed for every 124 employed and one was injured for every eight employed, making railroading as dangerous a business as war. A comparison with the year 1895 shows that, while in 1906 one passenger was killed for every 2,227,041 carried and one injured for every 74,276 carried, in 1895 one passenger was killed for every 2,984,832 carried, and one injured for every 213,651 carried—figures which show an appalling increase in the danger in railroad travel. Most of the deaths of passengers are due to collisions, and the collisions are in a large majority of instances due to certain defects in management, for which the most comprehensive remedy is the block system. The commission has, therefore, recommended repeatedly the statutory enforcement of the use of the block system on all railroads doing interstate passenger traffic, and now makes the same recommendation again. In the few serious collisions that have occurred on block-signalized lines the management and discipline—in every case, with possibly one exception—have been shown to be glaringly faulty, demanding government investigation. The principal railroads are extending the block system, but a law should compel its universal adoption. Such a law has been in force in Great Britain for seventeen years with excellent results.

From Cape Town to Cairo Under the British Flag.

tures, is the work projected by the Germans under the name of the Bagdad Railway.

"Naturally they wish to guard for their sole enjoyment the glory of the undertaking and—the profits. But England, France, and Russia are not willing to have one Power monopolize this route. The 'Eastern Question,' that wound in the side of Europe, is opened afresh; the diplomats, the financiers, engage in furious conflict over the business. And for four years the Bagdad Railway has been the axis on which all the political questions of Europe revolve. The idea of these Powers is to make the Bagdad Railway an international, and not solely a German, affair. They wish to take part of the stock, to receive some of the con-

# The Importance of Teaching Horticulture in the Public Schools

Mary E. Canode

It is a well known fact that any demand for human necessities is always, sooner or later, met by a corresponding supply. But it is also well known, that when the capricious American people take a sudden notion to make an unexpected demand for a certain article, it takes time for the producers of that article to educate beginning workmen up to doing the standard of work that will produce the best results. As the demand for the article increases, there also increases a demand for a better or the best, so that the unskilled workmen are frequently unable to keep pace with the demand. The purport of these statements are to present the idea of the importance of teaching in our rural schools, that kind of agriculture for which there is a rapidly growing demand.

That the rural school is the place where it should be first presented to the youthful mind, goes without question, since its location in the country presents the necessary conditions and the proper class of pupils for the study of horticulture. With all the necessary material at hand and the observing country youth for a pupil, there should be no serious difficulty in making it a part of regular school work.

This age has become one of specialties and specialists. That this is a good thing no one can deny. From dabblers in all the arts, sciences and professions, our people have come to respect only the work of the man who makes one branch of either of these his special occupation. From the "Jack of all trades," we have a transformation to the skilled workmen of one trade; and instead of farmers who once thought it necessary to raise everything in the line of native produce, we now have the special dairyman, fruit raiser, cereal farmer, and horticulturist. And the rapidly increasing demand for horticultural products shows the importance of educating our country youth for that specialty. The fact that it will be an easy matter to interest the rural pupil in this line of study proves that it should be taught as a necessary branch of his early education; for that to which one naturally takes is that in which there is danger of pursuing ignorantly.

Wherever the study of simple botany has been introduced into the rural schools it has proved to be both successful and interesting as a study, and when the child is once brought to realize that there is something interesting to learn about the cultivation of vegetables and that he need not wait until he is grown up before he can learn this, the study will prove to be as attractive to him as botany. In fact both can be successfully taught as one. That there is a necessity

for educated farmers is a rapidly growing idea. The occupation of farming is entitled to as much respect and honor as that of the statesman, and being educated as to the method of how best to pursue his chosen work is just as important to the one as to the other. When all departments of agriculture have once become specialties, and the country youth has been taught to regard his occupation as a pursuit worthy the care of an educated mind, then the proverbial "Mr. Hayseed" and the innocent country victim of the city gambling den will have disappeared.

The crowded cities are making heavy demands daily for horticultural products. The supply must come from the rural districts which alone can furnish sufficient food for the hungry millions. From the rural schools must come those who are to undertake this work and if more of the boys and girls of our country districts were taught to take a real interest in such occupations, there would be fewer instances of the young people deserting the pure surroundings of their country homes for the morally and physically poisonous life of the city.

Should the study of horticulture become a part of his early education, the child, as he advances into youth, would be enabled to decide for himself to what particular kind of horticulture he and his surroundings are best adapted. Confidence in knowing rightly how to do a thing gives dignity to the occupation and makes attractive any kind of employment. Then, let our country scholars be taught that upon them will depend the future skillful cultivation of the soil, and upon their products must the cities depend for their supplies. Let them be taught to know what they are doing, why they are doing it, and how to do it aright, and the result of such teaching will become apparent when the time comes for them to work on their own responsibilities.

But the question arises, "How can it be taught?" It may be thought by some that the person who is expected to excite the interest of the rural child toward the pursuit of such a study must himself be possessed of considerable scientific knowledge.

While a knowledge of all the natural sciences and familiarity with their multitudinous technicalities would be no hindrance, these are by no means a necessity in such preliminary work. All these, as well as expensive apparatus, have their uses, but there is no call for their confusing display in the ordinary school room. Not one foreign name need be used if the English name is known. A dicotyledonous plant is just as dicotyledonous if we say it has two seed

leaves, and the parasite that destroys a plant is the same parasite whether or not we have a thorough knowledge of its anatomy.

Every rural district possesses its natural resources of which the capable teacher will avail himself as assistants in presenting his subject. The plants that are found in his district will be sufficient text book for his purpose.

In the matter of teaching this subject, the pupil should be made to feel that to become acquainted with the names and parts of all the plants that are cultivated in the home garden is an important part of his own mental growth. He should be led into investigating the mode of development of his most intimate vegetable acquaintances by being given a few of their seeds to plant. His attention may be called to their likenesses and differences. The teacher can suggest that some of these seeds be planted in one kind of soil and some in another. The scholar can thus watch the development for himself and decide which soil is best suited for each plant. This will show him that the soil has much to do with the growth, and the pupil will soon be led to inquire, 'Why? After interest has so far been aroused the embryo horticulturist may be led to the desire of planting his own small garden patch. This might even be done in the school-room. The sunny window may be used as a miniature garden. Gardening on a larger scale on the school yard would be even better where all the scholars could take part in planting, cultivating and watching for results. In this way the effect of irrigation, cultivation and artificial appliances could be carefully noted.

Having the objects of study right at hand, they will, in all probability, discover that something injures certain plants, and investigation will naturally follow. Then will arise the question,—what can be done to get rid of the enemy? Experimenting for cures may follow and should the teacher be baffled in the attempt to exterminate the mildew or other parasite, he or the older scholars can seek information from the practical horticulturist or from horticultural reports. By so doing the pupil will gradually learn all the known cures for such pests without being obliged to know that there is such a word as "myology."

The attention of the pupil may next be called to the effect that cultivation has had on the shrubbery, trees and flowers around him. He can be impressed with the fact that they may be cultivated to such an extent that not only can their seeds be made to lose their power of germination, but that the seeds may be changed into a part of the fruit.

The teacher will need to have a pretty good knowledge of the local plants, whether food producing, ornamental or obnoxious weeds. Of the latter, that an attempt may be made to learn the best time and method to employ for their extermination. The apparatus necessary for such instructions need be only simple

utensils, and a small microscope to add special interest. Every possible advantage should be taken of the local flora. Home plants will furnish more material than either pupil or teacher will find time to investigate. Ability to instruct on the part of the teacher is far more important than extensive technical knowledge or scientific apparatus.

It must be remembered, however, that education is a growth and that one must not expect to do any great amount of such work in one term. Some things must be taught one term, some another. Using the simplest things and employing the easiest means is always best for the beginner. As in all other branches of study, step by step, year by year, his knowledge will advance so that when he leaves the rural school he will entertain a desire to become more proficient in both the theoretical and practical knowledge of this branch.

## HOW WE THINK.

### 8. Conscience.

H. M. FOGELSONGER.

PERHAPS some readers thought that in the preceding articles the "experience" side of our mental life was emphasized too much. I did not mean it to be so. As was said before, we must not forget that we have inherited many things and that we are organisms living in organized society. In the human sciences we can only go a short distance until we are engulfed in a cloud of darkness. Once in a while light breaks through the cloud and the earnest seeker of knowledge is able to collect himself anew.

All the fundamental principles of the mind that have been noted under Attention, Memory, Will and Reason must be recalled in the study of the conscience. The word "conscience" is indefinite in meaning, used by many persons to designate some inner voice that tells them what they should and should not do. It is one of those big words in our language that frighten as well as attract people, and no two persons agree on what conscience is, so long as they look upon it as an inner man speaking through an outer self. A mystery will always remain a mystery if we continue to push it off into a being further away. Yet no mystery is ever fully solved. We can only become better acquainted with it. In that spirit let us study the conscience.

Every normal person has an ideal of how he would like his or her life to be. Figuratively speaking we build life's ladder ahead of us and then climb to greater heights. We meditate and plan how we want to be and live. We are continually building houses that we shall occupy later on. It is difficult to tell when this building begins, because when very young we have our ideas of right and wrong actions. The mother teaches the child not to do certain things because they are naughty, but before that, the mother

teaches the infant the rudiments of love. The child puts its tiny arms about the mother's neck and laughs and the mother is pleased. The child soon knows what pleases its mother and what makes her unhappy. Later on it finds out what it should do to please other people besides the mother, and little by little some actions are inhibited while others are encouraged. Thus the child grows into maturity with the idea before him that there are some things right and other things wrong. The knowledge of rightness or wrongness of an act grows upon us so gradually that we forget when it first started and say that the belief is inherent.

It is easily seen that our early training plays a very important part in the forming of our ideals. When young, the child absorbs much from its elders by imitation. The boy wants to be a man and the girl wants to be a grown-up woman. If the father is kind with his horses the son naturally incorporates kindness to dumb brutes in his ideal of right living. We often see women who are careless in their house work and yet are zealous church workers. Then their neighbors, whose habits at home are the opposite, wonder at the inconsistency of a busy church member with a poorly kept house. Very likely the careless woman was never taught by her mother that a neat house is the result of a well-rounded religious life. Because of this lack of early training her ideal of life did not include a tidy home. This is only one out of many illustrations that might be given. Our habits of doing work and general likes and dislikes are formed chiefly when young, while our religious beliefs and philosophical views of life are formed in later years.

We do not perform an act that is not governed by some ideal or habit. No truer statement can be made than that the present is as it is, because of the past. Our life ideals grow out of the past, for where else could they come from? We do not build upon nothing. The very worst criminal builds upon a foundation laid during his past life. If a child is never taught to consider the rights of others to their own property, can you expect him when grown up to be other than a robber? There are many people who think the purpose of life is to satisfy the selfish wants whether they do or do not injure others. They have grown up with that ideal and how can you expect them to be upright citizens until they are better educated? We say that such people have a seared conscience. Their conscience is not seared but they have a *wrong conscience*.

Early ideals are often twisted or pushed to the background by later influences. A man may have had good parents who taught him the principles of a pious life, but, by a change of environment new forces work upon him until he leads what we call a wild life. In this state does his conscience lash him? No, only a part of it. His conscience is composed of the early

ideals plus all the later ideals. So there is a conflict between the several voices, between his many ideas of right and wrong actions.

We have mentioned parental training as an important factor in the forming of a conscience. There is another, "What others do." The persons who pride themselves in being independent of others will wince a little when they examine themselves. Our mode of dressing, our rules of decorum and of society, and many daily habits not necessary to mention are gotten largely from other people. As was said, we live in an organized society and are inter-dependent. We cannot act entirely different from other people. If we should we would be stubborn and not fit to live in a civilized neighborhood. We pick out what seems best for us from other people's actions and incorporate it into our life ideals.

And there is yet another source, which is our reading matter. The thoughts of literary artists never enter a man's mind without changing his life purposes. When we visit a new country we need guides to show us the places that are worth seeing. Good books are guides to newer fields and to higher flights of thought. How often, after having read a book have you exclaimed, "Well the author has certainly given me something to think about." Yes, he has done more than given you something to think about; he has changed your ideals, or conscience, if you please.

Our religious ideals also depend upon our parental training, our environment and our reading, hereditary influences being included, of course. There is always a reason for us to think that it is right to do an act. The belief does not arise out of nothing. The conscience of the cannibal does not hurt him when he eats a missionary and he does not "know better" until he has been taught the benefits and beauty of a Christian life. The conscience of a Buddhist is satisfied when he obeys the doctrines of his faith because he has been taught nothing else. Those who believe that the conscience is a special, God-given power, are on the safe side so long as they make themselves clearly understood. But we must remember that all good is a part of God. Good and worthy ideals of life reflect the God-life just as everything good and beautiful does.

We now come to the old question: Is it safe for us to obey the dictates of our conscience? Whether it is safe or not we always do obey our conscience unless present circumstances overrule. And after a study of the make-up of conscience no one will say that it is always safe to follow it. The best plan is not to think about your conscience at all as a thing in itself. Get healthy and strong ideals of life by associating with strong characters and by meditating often upon the life of the greatest person who ever lived,—Christ.

## CURRENT COMMENTS

### NOT ABLE TO KEEP UP.

The astonishing advances which are being made by local option and statutory prohibition make the statements of one week incorrect for the facts of the next. In the cut which we recently used to show the wet and dry localities of the Union, Georgia, Kentucky and Oklahoma should have had a white field, for they are now prohibition states by statute, but we had the cut made a few months too soon to catch them.

During the present sessions of various state legislatures two hundred and fifty bills on the temperance question have been considered by thirty different states, and not a single favorable whisky bill has been passed. Every-

Suggested as suitable device for the  
SALOON SIGN BOARD

where the Anti-Saloon League has gained its points and the saloon evil has retired. If the new constitution of Michigan is adopted it will forever prohibit the manufacture and sale of liquor in that state.

The Northwestern Railroad has become a dry road so far as its employes are concerned, while the Burlington road has stopped the sale of liquors in its dining cars while in the State of Iowa. Belgium and Switzerland have lately prohibited the manufacture and use of absinthe, a deadly narcotic. The labor organizations of Germany have placed their veto upon liquor because it is a foe to the laboring man, while the party leaders in office now in the British Parliament have put themselves upon record as favoring national prohibition.

While such rapid progress is being made it will be impossible to give the fullest facts on prohibition. But

why should not a movement so commendable as prohibition grow? Are you helping its growth?

### THE WORKING GIRL'S GRIND.

After a little the talk came around to wages, and someone said, "There are so many girls who have good homes and are working only for pin money." Miss Harris declared, "They can make a better appearance than we girls, who have to take care of ourselves; and, as you know, it is the looks that count more than anything else in getting a position. Then, there are a great many young married women, who haven't anything to do all day, while their husbands are working and they come into a store to earn more money with which to dress. And every year there are more and more applicants for positions, with the result that employers can fill any girl's place at any price they choose to pay. Why, even the Working Girl's Homes have been used as an excuse to cut down our wages! They tell you, that you can get board and room at four dollars a week, at one of these Homes, and want to know why you ask for more money."

"Yes, and that is not all they say!" Edith Curtis interrupted. "There's some who'll tell you they don't expect you to keep yourself on what they give you, but to go and get your livin' outside. That's a fact!"

"Yes, I am afraid that it is," Miss Harris affirmed. "At any rate, our wages won't go any higher, and when our good looks are gone we have to make room for a more attractive girl. You see we are practically forced to get married, and the men say, we are driving down their wages and taking their places, so that they cannot afford to marry; and altogether we are being pushed pretty hard from all sides without any prospect of things getting better."

There was a long silence broken finally by Edith Curtis.

"You take my case, for instance. I began when I was ten years old, deliverin' hats for a milliner, for two dollars a week. I'm twenty-two now, so there's twelve years of hard work behind me. Twelve years of bein' tied to the grind. I'm only one girl out of thousands who have been doin' the same thing, and now what is the future goin' to be? Pretty soon I'll be that ugly and wrinkled that people'll hate to look at me, and there's days now when I'm so tired I can hardly hold up my head. The fact is, that my body's kind o' worn out already, and it's just my age which is the very worst time for us girls. We're always tired and anxious and it's then that comforts seem worth any price. It's my age, too, that girls take to drinkin', and you wouldn't believe how much of it is done. Say, it's awful! Why in our store there's as many as fifty empty pint flasks of gin or whisky picked up every night in the wash room. First, the girls take headache powders to brace 'em up, when they're dead on their feet. Then, they take to gin or whisky, just a little to begin with, but I guess it makes them feel better for awhile, and then it ain't no time before they're at it every couple of hours. I say it's awful, because a girl like that ain't responsible, and the Lord knows it's hard enough to be straight when you've got all your wits; but drinkin' is gettin' worse among the shop girls in our city, all the same. Seems as if they were driven to it, and there are days when I feel ready to take anything to keep me goin'! There's hundred of girls, more like thousands, I guess, who are at it all the time. These little tea rooms—you've seen the signs on cross streets—well, you go in there after closin' time and you'll find 'em full of

shop girls drinkin' whisky out of teacups. But what's the use of talkin' any more about it? It's just too easy the way things go now to get the habit of takin' somethin' 'to pick you up,' as they say."

### THE TENDENCY TO INTERNATIONALISM.

The world is vastly broader than any single nation. The tendency is to do things along international lines, on the universal scale. Transportation and communication have become world-wide in recent years, too far-reaching to be limited by national sentiment or racial and political boundary lines. We are approaching the age not only of internationalism, but of the **unity of all nations**. There must be a leader in the work of unifying all peoples, and bringing all their energies into the lines of forward movement. The American nation is destined to demonstrate to the world the advantages of world coöperation and unity. America must be the great liberator; it must give to the world a new spirit of progress, new songs of freedom, new processes of achievement.

### THE GROWTH OF NAVIES.

The mad rush to build the largest navy increases year by year. Twenty years ago no nation thot of competing with England, because her navy has, in the past, eclipsed the combined navies of the world. In spite of this, Germany, France, the United States and Japan are preparing to dispute England's naval supremacy, altho they are likely to make a sorry spectacle of themselves, for England can increase her navy as rapidly as the other nations increase theirs and she is doing it. The cut shows Germany's ambitious desire to outstrip France and the United States. But at present our naval authorities have enough battleships planned, or asked for, to keep even with Germany.

The folly of such suicidal work needs to be amplified by the press of this country. A battleship is outclassed by wear and improvements ten years after it is built, so that the expense of billions of hard-earned money is continually heaped upon the people uselessly at an ever-increasing rate. This childish play at murder by the nations is prompted by the devil.

### FOOD NOTES. No. 4.

We now come to a practice among farmers that seems criminal, and yet it is a very general practice and well known to the public.

We refer to the marketing of a herd of hogs diseased with the cholera. Some city people may think that this is a small matter, but it is not, for some states lose as high as \$10,000,000 in cholera hogs, in a single year which shows the prevalence of the disease.

When cholera strikes a farmer's hogs he ships the diseased and healthy ones all together—anything that is able to walk up the chute into the car. A few die en route to

market, but these are said to be killed by others in the car. A few die in the stockyards, but these are said to have died from being jostled in the cars. The remainder, half of which would have died from cholera inside of forty-eight hours, are butchered and sold, yes, and eaten, some of it raw.

If you never lived in a community where swine raising was the leading industry you cannot grasp the extent of this practice. Cases are known where half a dozen hogs were dying daily in the herd and after one hundred of the two hundred had died the remainder were sold for healthy hogs.

What has been said of marketing diseased hogs applies equally as well to poultry. The packing houses are not responsible for this practice, but someone is. Farmers would not like to put up their year's meat from a herd of cholera hogs. Why then ask the public to eat meat from such hogs?

If an unsound horse is sold as being O. K., the buyer can recover financial damage, but when diseased meats spread disease in the human family the law takes no note of it. If a local butcher should buy and offer for sale in his shop a few hogs taken from a cholera drove, he would lose his trade and the grand jury would soon indict him. Yet the twelve farmer jurors, who would convict the

GROWTH OF THE GERMAN NAVY.

340,000 tonnage in 1906, 717,000 tonnage in 1914.

butcher, would turn around and sell a whole drove of cholera hogs, the next day to be eaten by city people one hundred miles away.

The School Management Committee, of Chicago, adopted a form of resolution recently, which, if indorsed by the board of education, will amount to a death blow to high school fraternities and sororities.

The resolution is in part as follows:

"Whereas, Study into the effect of such organizations upon the school system has conclusively proved that they are so subversive to discipline and injurious to the scholarship as to require further restrictive action by this board; therefore, be it

"Resolved, that, on and after a certain date all pupils attending the public high schools of the city who are members of secret societies, commonly known as Greek letter fraternities and sororities, having their existence or activities in whole or in part in any public school of said city, shall be suspended."

# THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## A BURNING INCONSISTENCY.

NINE-TENTHS of the INGLENOOK subscribers are professing Christians, and fully half of these nine-tenths take secular papers, in which whiskey, cigars and tobacco are advertised. In short, you are helping spread such wares not only to your own children, but to the entire community. It is time for you to awaken to the fact, that for a Christian to buy a distillery advertisement once a week, or 365 times in a year, is not a good use of the Lord's talent which he has entrusted to you.

Then some self-righteous people stop the INGLENOOK sometimes in order to get some state paper in which these wares of the devil are advertised. The INGLENOOK is not a prayer meeting paper, but it does advocate righteousness, denounce evil and instills in its readers a spirit of devotion to all good works.

Now if you have found some fault with the INGLENOOK in times past, and have quit taking it, do you think you have made a wise choice by opening your doors to the advertisements of liquor manufacturers, and games of sport and chance, which glaringly meet you as you look thru your paper?

The INGLENOOK does not boast perfection, but on the other hand it would not be guilty of opening its columns to anything which we know is wrong.

## OUR ORPHANS.

Do not forget that the INGLENOOK has gone in the orphanage work. Already three INGLENOOK homes have been opened to receive an orphan child—two in Pennsylvania and one in Alabama. Others who want a child will please tell us the sex, age and conditions upon which you want to take a child and we will put you in touch with a child within your own state. Some want to adopt a child. This means for it to become an heir to your wealth. Others want to take a child by

contract until it is of age, and then pay it whatever may be agreed upon when the child is taken.

Also tell us of children needing homes, giving age, sex, health, conditions, etc. With our readers scattered from the Atlantic to the Pacific we ought to accomplish some good as time goes by.

## TO OUR LITTLE FOLKS.

THE Editor supposed that every home had a child's paper and therefore the INGLENOOK could give all of its pages to adults, but letters to our office indicate that many homes depend upon the INGLENOOK for their entire current reading because it is, as one father writes, "safe for everybody." We shall introduce, into the home department, some reading for children.

## LOVERS OF NATURE.

LETTERS to our office indicate that our readers are lovers of nature. Why shouldn't we all be? We are at least half brothers to nature. Yes, we expect to introduce more nature matter into our magazine. Let the rural readers report freaks, facts, studies and illustrations from nature. The Editor has never found any one yet who does not admire nature if it is only at noontime when he has his feet under a richly laden table. To grow away from nature is to die to the true, the beautiful and the good.

## OUR CORRESPONDENCE TABLE.

BELOW we give a few extracts from two of our readers and the replies which we made:

1. "If you are going to teach war any more like you did in that article about the Navy, I will stop taking the INGLENOOK, and will not act as agent for it any longer. I don't want war, I want peace!" Signed J. E. C.

Our answer: "In the number containing the article on The American Navy, there was not a single statement favoring war, nor has there been one such statement in the INGLENOOK during its nine years' history; nor will there be in the future, but there has been hundreds of lines denouncing war. It is possible and profitable to give facts concerning war without advocating war, just the same as you relate a murder case without justifying the deed." Editor.

The advantage which the INGLENOOK has over such objections is this: The parent who wrote the above letter, buys histories for his children to study, in which much war is described and held up as a virtue besides. He does not quit buying those books either, but when the INGLENOOK speaks about war and denounces the art as useless and wrong—just what the good man believes—then he quits the INGLENOOK in a rage. How readest thou?

2. "The Christmas number of the INGLENOOK put

new life into me. I was left an orphan when two years old, and remained so until a good brother and sister adopted me as their child, and gave me all the enjoyment which this earth affords. I have been married for many years, but have no children, and it never occurred to me that I should take some orphans into my home until that number of the INGLENOOK came. I shall now give all my spare time to the interests of other orphan children. Will you give me the address of an orphan home? I want to adopt some little brother and sister, if possible." Mary E. S.

Our answer: "You are only one of many who were touched by the orphans advertised in the Christmas number. Your name and request have already been sent to two orphan homes in your state. This has been a long-neglected work by too many Christians. It is a work which thousands can do, who cannot preach, or go abroad as missionaries. The Lord bless you and all others who engage in this work." Editor.

#### HOW WE THINK.

WITH this number closes the articles on How We Think, by H. M. Foglesonger. These papers created quite a stir in a certain educational center, because the teacher of philosophy in the college concluded that Mr. Foglesonger was a materialist from what was said in the third article.

The mistake was made by reading only one paper in the series and framing conclusions from that one point of view and refusing to read any more of the articles. We want to draw a lesson from this for all of our readers.

The lesson is this: Do not be too quick to form a final judgment of a man or a paper from just one point of contact. You may strike the only weak point first, and miss a thousand good qualities. It would be unjust to charge Mr. Foglesonger with being a materialist after reading all of his articles. He gives full right to spiritual powers and nowhere teaches a mechanism of forces capable of producing mentality. Spirit reigns supreme, matter is a servant.

#### A TESTIMONIAL WHICH THE INGLENOOK ENDORSES.

WHATEVER the present opinion of publishers may be concerning the necessity or wisdom of a great number of pages per issue, thoughtful and intelligent persons generally find the bulk of modern publications, especially of Sunday newspapers, a source of continual annoyance. The huge comic supplements are often so puerile that they induce a sense of melancholy; yet merely to divert thoughtless men and women for a brief Sunday morning hour with impossible and extravagant pictures printed in loud colors, thousands of stately spruce and hemlock trees upon the northern

hills, which have raised their graceful branches to the sunshine and rain of many changing seasons, have lived,—in vain.—*Review of Reviews.*

#### WHERE A RATTLESNAKE WAS FOUND.

THE toad story last week recalls another interesting discovery which took place in our own family—one which we can personally vouch for, altho the toad story is also true.

A generation ago a man was digging a well in Iowa, when at a depth of fifty feet, he found a live rattlesnake, which was full of fight. This animal had no entrance or exit to his home.

One of the strange things about this snake was that, for six hours after its head was cut off, it would fight whenever any one came near. How it could sense people and conduct a warfare in its acephalous condition was a mystery.

Nature study is interesting and helpful in both its normal and exceptional conditions. It would be a good thing to have a little more nature study in our paper,—not too technical, but plain, practical everyday nature which we all enjoy.

#### A QUIZ ON BUSINESS TERMS.

1. WHAT is a clearing house?
2. What is a bonded warehouse?
3. What is a common carrier?
4. What are consols?
5. What is a consul?
6. What is a letter of credit?
7. What is a trust deed?
8. What is a funded debt?
9. What is a demurrage?
10. What is a salvage?
11. What is the meaning of fee simple?
12. What is tontine insurance?

#### "PROHIBITION DOES PROHIBIT."

So Said an Agent of the Schlitz Brewing Company.

"ANYBODY who says that prohibition does not prohibit is either a liar or a fool. I am now on my way to Wisconsin. I also work in North Dakota, and I can sell more beer in Wisconsin in four days than I can sell in North Dakota in four months. Our company is not telling this, but we are doing all we can to disgust the people with prohibition so that if the question ever comes to the people they will vote out prohibition."—*The Echo.*

#### QUERIES WANTING AN ANSWER.

What are some good vines and plants for shading windows and porches in summer?

Are there any that will grow well on the north side of the house?

## FOOD PRINCIPLES

LENNA FRANCES COOPER, Director Cooking Department  
of Battle Creek Sanitarium

THE chemist who expects to get definite results by compounding certain chemicals must, of course, be very accurate, both in his measure or weighing, and in the manner in which the materials are put together.

No less need is there for the cook or housekeeper to be careful if she wishes to obtain definite results from the materials which she puts together, for the foods which she uses are composed of chemical compounds and have definite characteristics, values and uses.

The intelligent stockman knows the food value and the effect of the various kinds of foodstuffs which he gives his animals. *Why should a mother know less about the foods which she supplies to her family?*

Foods are, first of all, made up of certain definite chemical compounds, which we term Food Principles, such as fats, starches, sugars, etc. These are in turn made up of the chemical elements,—such as carbon, hydrogen, oxygen, etc. But we are not so much concerned about the chemical composition as about the characteristics and nutritive value of these compounds which we know as Food Principles.

In the first place, they are of two general classes,—the incombustible, or those which are not capable of producing any heat; and the combustible, or those which do produce heat when burned or “oxidized” in the body. That combustion or oxidation takes place in the body is evidenced by the warmth of the body indicated both by the touch and by the thermometer which registers the body temperature about twenty-five degrees higher than the surrounding atmosphere. When we remember that this temperature is kept up both day and night, with practically no variation, we cannot fail to realize that there must be something which feeds these “eternal” fires. The fuel which feeds these fires is our food.

Below is a general classification of Food Principles, the details of which we shall study a little later on:

### Food Principles.

- I. Incombustible.
  - Water.
  - Mineral Matter.

- II. Combustible.
  - Carbohydrates.
    - Starch.
    - Sugar.
  - Organic Acids.
  - Fats and Oils.
  - Proteids.
  - Cellulose.

All measurements used in this series of articles are level. This means that spoonfuls or cupfuls of any ingredient is leveled off perfectly level. This is the only accurate method.

The writer once asked a class of young ladies to take a heaping tablespoon of flour and then to measure it into level spoons to find how many level tablespoons the one heaping spoonful made. The result was all the way from two and one-half to four level spoonfuls. This shows how the measurements of different people vary unless done by definite standard. Hence the level measure has been adopted in almost all cooking schools as the only safe and reliable measure. The cup used in the measurements is the half-pint measuring cup. The cup which is divided into thirds on one side and into fourths on the other side is the most satisfactory.

The spoons used are the table, desert and teaspoons in ordinary use, or, better still, the set of measuring spoons which may be procured at almost any hardware store.

Below are a few recipes which illustrate these principles:

### Cream of Browned Onion Soup.

- 4 medium-sized onions
- 1 cup milk
- 1 cup cream
- 1 cup water
- 1 teaspoon salt
- 1 tablespoon flour.

Cook the onions in a small amount of water until perfectly tender, and until the liquid becomes quite syrupy and rather brown. Then rub the onions thru a colander or a sieve. To this pulp, add the water and milk; let come to the boiling point and thicken with the flour, moistened with a little cold water. Cook five to ten minutes, then add the cream and serve.

**Potato Loaf.**

Pare the desired number of potatoes and cook in boiling water. When tender, drain the water off, and put thru a colander. To each pint of the mashed potatoes, add

$\frac{1}{3}$  cup cream                      1 egg—well beaten  
1 teaspoon salt.

Add the cream and salt to the mashed potatoes and beat thoroly. Then put in the beaten egg, turn into a baking dish and bake until a nice brown.

**Banana Snow.**

1 cup sago                      Juice of 2 lemons  
6 cups water                   $1\frac{1}{2}$  cups sugar  
1 cup sugar                  Whites of 3 eggs  
6 bananas.

Soak the sago one hour in one cup of the water. Mix the sugar and lemon juice with the sago and pour over it the five cups of boiling water. Cook in a double boiler until perfectly transparent. Then pour this over the stiffly beaten whites of eggs, beating meanwhile; cool slightly, then put this mixture in layers with the sliced bananas in a pudding dish and let stand until cold. Serve with cream and sugar or with any preferred sauce.

**Fig Sandwich.**

Spread thinly-cut slices of bread with butter and then with a filling made as follows:

Wash and cook figs until of a consistency of a thick marmalade. Then to each cup of the marmalade, add one-half cup of maple syrup or sufficient to thin it to the proper consistency for spreading. Put the slices together and cut into any fancy shape. These are especially nice for luncheons.

**IS IT WRONG TO DANCE?**

WHY not ask, is it expedient to dance? Will it pay? Is it wise and safe and sane? Is it better to dance than not to dance? Consider a few facts:

1. Many of the best people in the world never danced. Dancing is, therefore, not an essential virtue.

2. No person noted for dancing has ever been noted for religious devotion. Never.

3. Many innocent-minded girls have been ruined by attending dances. None have ever been saved by dancing.

4. No person can add anything to the worth of his character by becoming an expert in dancing.

5. No person can add to his influence, not even in the eyes of the world, by frequenting the dance.

6. It requires no extraordinary intelligence to become an adept at dancing. Flinging the heels does not develop brains.

7. Mixed dancing becomes very fascinating to its dupes, and they rarely break away from it for exercise more wholesome.

8. It costs time and money to dance, and if these are not lost, nothing can be lost.

9. Many young men who prize the welfare of their sisters do not wish their sisters to attend balls.

10. Dancing church members are usually worth little to the church. The love of God and the love of dancing do not hitch.

*Michigan Christian Advocate.*

**GARDENING.**

WE hereby call for some information on gardening. Some of our good wives feel timid about writing an article for publication, because they fear mistakes, but in this case correct language and a ready tongue will count nothing. We just want you to state the best order of planting garden seeds, so as to raise the most on the smallest patch of ground.

Some city people have but a small garden and it is worth much to them to know what to plant first, so that it can be followed by the next earliest, and so on. You know radishes are over with in a few weeks, and the ground, where they grew, can be sown to something else. Begin with your earliest plant, tell how far apart and when to plant. Also tell how a few flowers can be planted in and around the garden to beautify without taking too much space.

We want all manuscripts to be in by March 1, 1908, so that the results can be used this spring. It will take you only a few minutes to take a pencil and paper and write us your plan. Do it today. It may make a thousand people happy.

**OTHER GOOD THINGS WANTED.**

IN addition to the essays on gardening and flower culture, we want hints and experiences on poultry raising and summer work in general. Thousands of our readers will be busy in a few months and anything that you can say or do now to make their housework easier or more agreeable will be gladly received and kindly remembered. These suggestions may relate to the making of clothes for children, remodelling clothes for adults, house furnishings, house cleaning, painting, papering, preparation and serving of meals, or work outside of the house, the yard, the orchard, the berry patch, the chicken yard, etc.

You will find your work more delightful as you begin to study it in the spirit of helping some one else. The INGLENOOK is a live wire to convey helpfulness to those needing it and we want to develop this spirit among our readers.

**FLOWER CULTURE.**

WE want plans submitted for the best order of raising summer flowers. How to follow one plant with

another, how to arrange the different sorts and colors of flowers so as to increase their beauty. Kind of soil, cultivation, time of transplanting, frame-work necessary for plants, position as to sun, where to secure the seed, and so on.

God has given us a rich legacy of his love in the beautiful flowers which beautify this old brown earth. Now let us use them and help each other to get some good out of them. We want a beautiful home without and a good home within. Flowers will help us attain to this end.

#### WHAT AMERICAN WOMEN DO.

THE total number of women engaged in gainful occupations, according to the census of 1904, was 5,319,397. In 1900 there were about 4,000,000. At the same rate of increase there are now fully 6,000,000. During the decade 1890-1900 the number of working women increased 33 per cent, while the total number of women increased but 22 per cent. Thus the working women increased half again as fast as her sex.

Not only are the working women increasing phenomenally and disproportionately; they are invading almost every one of the 305 gainful occupations enumerated by the census. They may be thus roughly classified:

|                                              |           |
|----------------------------------------------|-----------|
| Agricultural pursuits, .....                 | 977,336   |
| Professional service, .....                  | 430,597   |
| Domestic and personal service, .....         | 2,095,449 |
| Trade and transportation, .....              | 503,347   |
| Manufacturing and mechanical pursuits, ..... | 1,312,668 |
| Total, .....                                 | 5,319,397 |

When the returns are examined in detail, however, it is seen that there are but eight occupations in which women do not appear. From four of these they are excluded by the men, the four being: Soldiers, sailors, marines, and firemen. The other four are: Apprentices and helpers to roofers and slaters, helpers to brass workers, helpers to steam boiler-making, and street car drivers.

When we come to see just what this vast army of working women is doing some interesting facts appear. There are 665,791 farm laborers, 307,788 farmers planters, and overseers, 100 lumbermen and raftsmen, 113 wood choppers, 325,000 teachers, 6,418 actresses, 3,405 clergymen, 40 civil engineers, 30 mechanical and electrical engineers, 14 veterinary surgeons, 3,125 librarians, 2,086 saloon-keepers, 440 bartenders, 100 architects, 150 builders and contractors, 167 masons, 545 carpenters, and 1,759 painters, glaziers, and varnishers.

The most notable increase appears to be in stenography and typewriting. In 1890 there were 21,270 stenographers and typewriters. In 1900 there were 86,118, an increase of more than 300 per cent in ten years.

Curiously enough, the only occupations in which

women are going backward, as compared with men, are sewing, dressmaking, and tailoring.

In 1900 there were about 28,000,000 American women over 10 years of age.

#### REFORM NOTES.

REALIZING that the greatest enemy to Christianity is the liquor interests, whether licensed or unlicensed, our pen and thought is openly directed against it in every way, shape, and form.

It is the direct cause of the majority of charity work incumbent upon a mission; it is the direct cause of the urgent need of rescue mission work; it's supporters are openly against moral and religious work, hence we have no quarter to give in dealing with the liquor interests in any of its forms.

THE court has ordered the stations of the Great Northern railroad at Church and Ferry, N. Dak., to be closed and kept closed for a year because of the violation of the state prohibitory law. A drayman was allowed to store beer in it. He has been fined two hundred and fifty dollars, and the costs were taxed against the Great Northern. The decision may be changed by a higher court, but it is hoped that it will not. Infinite harm is done by the liquor interests, and the law restricting their business should be rigidly enforced, no matter who is made to suffer because of it. Laws are of no effect if not enforced. Every law restricting the destroying business should be made effective. The homes of the land need protection from this monster evil, and in time they will get it.

FROM the West recently have come two strong statements against liquor and the liquor business. Judge B. E. Lindsey, of Denver, Colo., said: "As a judge I have faced the woes, the trials, the miseries, and broken homes of society caused only by the want of a proper solution of this problem of problems. Thousands and thousands of homes have been broken up, caused by the traffic in intoxicants. I have divorced four thousand people, I have tried no less than six thousand children, in the past six years. This lamentable social condition is traceable in a large degree to the legalized saloon." And the Wyoming *Daily Tribune*, Cheyenne, Wyo., in answer to the question, "What is whiskey?" says: "Whiskey is the devil's own brew. Whiskey is the greatest enemy of civilized nations. Whiskey robs women and children of their happiness and their patrimony. Whiskey is the poison that kills intellect and morality and makes of man a brute. Whiskey is the handmaiden of the penitentiary, the insane asylum and the poorhouse." The words are none too strong. It is for Christian people to unite and say the curse has been with us too long and now must go.—*The Echo*.

## How George Went to College

O. H. Kimmel

GEORGE BOLTON was a keen witted and an ambitious farmer boy. He saw beauty in the growing crops, the green trees, and in the birds that flitted here and there about the farm. He was passionately fond of school work too, and always took great delight in pursuing his studies at Mount Pleasant, the district school which he attended. Early in his school life he began to lay plans to continue his studies in high school and college after he had finished his work at Mount Pleasant. His uncle James, an instructor in a university, usually spent part of his summer vacations with the family on the Bolton farm, and this, by his encouraging words, gave impetus to George's desires.

The father, however, bent upon his farm work, could give the boy no encouragement, and secretly felt envious toward his brother-in-law for putting, as he called them, "fool ideas" in his boy's head. Farmer Bolton was too busy to give his family any attention, and found his farm work and farm management intruding so upon his time, that, though he arose at four, and kept steadily at work until eight or nine at night, he could not find time at all to attend to the farm as it should be attended to. He realized this after a fashion, little realizing that his own hurry and his long hours were the real causes of much work, and the cause of so much work going undone.

He often looked forward with more pleasant anticipations to the time when George should be old enough to help on the farm, for he felt that then, two hands could keep things straight and in better shape. But, now, he began to see defeat in these plans, for his boy had a "fool notion" that he must go to college, and this notion was growing in the boy as he grew. What to do about it he did not know, nor could he think out a plan whereby he could induce the boy to reconsider his desires, in order that his own plans might be carried out. "Here," he thought, "is the farm, not paying expenses well, at least not more than doing so, and yet I work early and late; the machine shed blew down in a storm three years ago and I have never had time to rebuild it." In addition to this a binder, a corn-harvester, a corn-planter, a wheat-drill, a disk-harrow, a gang-plow, a hay-rake, a cornstalk-rake, some harrows, plows, cultivators and other farm tools, were standing out in the weather also. He knew that this was wrong and wasteful, yet he could see no other alternative, because he had no time to improve conditions, and he had "set his foot down" on hiring work done, years ago.

The good wife and mother protested against these conditions of things, but her protests were of no avail. True, he saw, that the machinery would not last so

long, yet his busy mind did not dwell upon this fact, and it was neither here nor there in his life. His sole desire seemed to be to find time in which he could do more work, for, he felt that the more things were going to rack, the greater must be his exertions; and in this manner, the family was living when George reached his fourteenth year.

He had finished his schooling the latter part of the preceding winter. His desire to attend some high school and then college was still strong, but he began to feel that it must smolder into dust. The last year had been a very disastrous one in many ways; a valuable horse had tramped upon a rusty nail and died, as a result; some cattle had died; the hog quarters had not been cleaned for a number of years and a large drove of fattened hogs had died of cholera after eating most of the year's crop. As a result of weathering, a new binder, mower, hay-loader, corn-planter, disk and other farm tools were purchased, and to save his life the farmer could not keep from adding a mortgage to the already heavy financial burdens on the farm. He finally told George one day, after the mortgage had been given that the "fool college notion" must be given up! George felt that he owed it to his father and mother to acquiesce with this decision, and so he bravely resolved to face the disappointment and resolutely settled down to farming with his father.

Late in the autumn after the crops were all gathered George was reading the county paper one day when he noticed that the Farmers' Institute was to convene in the county seat the following week. This, thought he, is of an educational nature, and I believe I shall attend if father permits. The parent gave his grumbling consent and the following Monday found George at the opening session of the institute. The exercises interested him greatly, and that night, as he told of the proceedings of the institute, the little mother listened in amazement at what George had heard that day, and the old farmer, though amazed at what these "per-fessers" seemed to know, only shrugged his shoulders and went out into another room.

The next day George provided himself with a notebook and pencil, and he found them of great service. One of the lecturers spoke on the care of farm machinery, and this lecture found lodgment in George's heart, and he began to study the question which resulted in changing his whole future career and ultimately changed conditions on the farm, by reducing the mortgage and putting the farm on a paying basis.

That night after supper George consulted his notes, and, as he did so, had much to reveal to the family. The absorbing topic that day had been "Farm Ma-

chinery, Its Care and Its Abuses," and the subject was ably handled by a man who had been actively engaged in collecting items and statistics for eleven years. First, he figured, that the machinery necessary to run an average farm successfully must necessarily cost from \$900 to \$1100. This outlay, he figured at fifty per cent of a moderate city home; such an outlay of money can not be made injudiciously without evil consequences ultimately resulting. He then entered into the discussion of the care of the machinery and when he came to the shedding idea, George followed him very carefully and did not permit a single item to escape him. We can not give space, here, to George's full report, but summed up in general, it was agreed, at the meeting, according to this report, that machinery unshedded throughout a year deteriorated 15 per cent, while shedded machinery would decrease in value but  $7\frac{1}{2}$  per cent. Thus figuring machinery at \$1,000 the annual saving by shedding alone would be \$75. This was figured at 40 per cent of the cost of a shed and that such a shed would pay for itself in  $2\frac{1}{2}$  years. After that time the annual savings would be added to the general farm income and to the family's comfort.

George's father looked at his son dubiously after the discussion was over. Evidently he was moved, but yet not fully convinced. Yet he ventured to say, "At that rate, let us count our loss in the four years we have been without a shed. They figured their machinery, wagons, feedmill etc., at twelve hundred dollars. "This would mean," said George, "ninety dollars for a year or three hundred and sixty for four years." "But" he added, "other things must be considered here." "You remember," addressing his father, "two years ago the old dead cottonwood was blown down upon our binder and ruined it. A well shedded binder they figured today should last ten years. That lasted us but two. It cost one hundred and twenty dollars: that should mean twelve dollars a year. Well, twenty-four dollars from one hundred and twenty dollars leaves ninety six dollars makes a total of four hundred and fifty six dollars.

Then, last year, Spark, our blooded colt, you remember, ran into the guards of the new binder and so damaged him that you could not get twenty-five dollars for him, while before the accident you refused two hundred for him. There is another one hundred and seventy-five to add to your loss. That makes a sum total now of six hundred and thirty-one dollars. Then, again, unfortunately our binder was ruined this year because it was setting on the roadside where it was destroyed by a runaway team. It cost, I believe, one hundred and fifteen dollars, and a loss of ninety-two dollars is again figured in, which makes a sum total of seven hundred twenty-three dollars. Then if we figure the loss of old Joe, who tramped on a nail in the barn, because of this same shiftless manner of our conduct and the loss of the cattle that died, and the loss of our hogs

this summer. we shall find that our losses, because of our shiftlessness, will not fall short of two thousand dollars—yes figuring twenty-five hundred dollars, or \$625 a year, fully enough to pay the mortgage you gave this year, and send me to high school for two or three years, or college for over a year." The father was visibly moved, but he arose, muttering something against "perfeessional" book farming, and left the room.

The next day at the institute George listened to a lecture on Correlation of Farming and Education, and another on Food Crops and the Wide and Narrow Ratio of Food Values. That night, after the chores were done, and the supper table was cleared, the family again listened to George as he related the events of the day. The educational theme was interesting and along a new line of thinking. First the speaker, by consulting his statistics announced that a fair average for uneducated labor was about \$1.55 a day, or \$18,000 for a working life-time of forty years. Averaging the earnings of educated men, from \$50,000 a year down to the lower walks of educated labor, \$1,000 per year or \$40,000 for forty years was considered a fair, yet, perhaps a low estimate on the life earnings. This shows that, in dollars and cents, an education is worth at least \$22,000.

The recital of this fact caused the old farmer to scowl again. True he could not deny that this estimate was well founded and that it seemed true, but he declared that it would not work in actual life any better than any of the other book farming, yet he was conscience smitten, and he knew it; still, he could see no way whereby his ways could be changed for the better.

On the last day of the institute George succeeded in getting his father and mother to attend. While it caused a sensation in the institute when the old farmer came stalking in to the institute where he was seated among his neighbors, yet it was true—stubborn old John Bolton was in attendance. That day the chief lecture was a plea for shorter hours of work on the farm, with additional comfort on the farm for every member of the family. The speaker pointed out that eight hours work was a man's or a team's full capacity; all work piled upon that per day was considered as a sin against the body for which compensation must be made in later years. He also suggested that each farm should have its repair days and its building week, in which all repair of fences, harness, pens, and buildings should receive due attention. He named many farmers who had adopted such a system and estimated their profits from adopting such methods.

The last speaker made a plea for the rural school, the rural church and the rural home and pointed out that these three institutions must always supply the land with its greatest men and greatest women. "Our presidents," said he, "our governors, our teachers, our ministers, our best business men, and the strong

men in all vocations must come from the farm and if our nation continues to progress in the future, as it has in the past, these institutions of the farm community must rise and make a bow to the new demands that are being heaped upon them, for the changed conditions of recent years have added much to what must come from them."

That night, the old farmer half admitted that, in the past he had perhaps made some mistakes. He was visibly stirred up, and the family could see it. But in a few days the light had faded and he was back into the bottom of the old rut again.

Not so with George, however. George's mind had been busy for some time and for two weeks after the institute he was strangely quiet. One evening he wrote to his uncle. Then he was more talkative. Within a week's time he received an answer from the uncle and he felt that his time for action had come. The opportunity came a few weeks after this, one rainy evening when the father was grumbling at his ill luck because the machinery must all stand out in the weather and take the rain. George said: "Father if you and mother will do me one favor I shall build a machine shed this fall, and not charge you a cent for it. I shall only ask that, when I am eighteen, you give me enough money to school me a year, if the savings resulting from the machine shed will figure out, as we figured them at the Farmer's Institute. If they don't, you will be out a very small sum, but if they do, you can school me a year, pay your mortgage, and have enough left to take yourself and mother to Europe for a three month's visit, and then have a snug sum left. You see what I mean, don't you? I ask that you and mother go my note for \$200 so that I can buy the lumber and material with which to build the shed. Now, don't laugh, for I am in earnest and I know what I am doing. Mr. Biggs at the lumber yard has told me that I could get the lumber in that way. Then again, if we build the shed and clean up the place, we can take a day or two and repair the fences, gather up the broken timber, clean up and fumigate the pig barn, etc., for all of this must be done if I undertake the task by your permission."

The old farmer was inclined to be sullen at first, but finally Mrs. Bolton and Grace interposed and he said, "Well, George, we can't do any worse than we are doing, and if it does nothing more, this scheme of yours will give you an opportunity to prove or disprove your 'book farming' theory, so I will give in; just pitch in and try it; but if you fail don't come to me; I shall call it a bargain, and shall hold you to your contract, through thick and thin. I think it will be the means of teaching you, who knows best, so just go at it."

George now said: "Very well, but we must not forget that, if I undertake this task we must clean up the place and get the farm in excellent shape for till-

ing." "I agree to that too," said the farmer, "I agree to do my part in this work, and shall help you what little time I may have. I don't anticipate any good results from this except that I shall get a machine shed, but I shall help through it all."

The shed was built, and the good machinery was stored therein. The worthless pieces were torn apart, the scrap iron being sold to an iron broker, and the wood sawed up into stove wood, or made use of in some other way.

The fences were repaired. The hog barn was cleaned according to the directions which George received from his uncle, who obtained them from the agricultural college. The windmill which had been out of order for two years was repaired, and, again, the farm was blessed with an abundance of pure water.

By spring the place was transformed. George and the father worked faithfully at repairing and cleaning and the results were plainly in evidence. Later in the spring the hedges were trimmed and the orchard pruned. The remaining hogs were sold and a new breed put in their place in due time. That summer, when the work in the fields was most pressing, work was continued until six thirty, but at all other times work stopped promptly at six o'clock. As a result the horses were in much better condition and the dairy, because of the better attention that it received, added fifty per cent to the returns of any previous years. Also, the farmer discovered that he had time to attend to the garden and potato patches and this result was very gratifying when the yield became known.

The people of the neighborhood wondered what had come over farmer Bolton, and one day his neighbor, Pat McGillan, overcome by curiosity asked the farmer as follows: "Faith, John, and yez been after a clanin oop yer farrum fur nearly a yare neow, and yez gotten so yez don't worrik narely so airly and late as yez used to. Begorra, John, phwats got into yez." The grave old farmer only answered that he felt a change was needed in that direction, to which Pat replied: "Sure—Its a wise mon I am after ratin yez; I always knew yez was a man of sinse and sound judgment."

The third year of the experiment was gradually drawing to a close at last. George was nearing his eighteenth year, and by hard work, in addition to his duties on the farm, had carried successfully a correspondence college course which would admit him at the university. He began this course a year after the experimental farming was started, for then, he foresaw the success of his enterprise. The family seldom discussed the new methods on the farm, but all saw the good effects. The grave old farmer was becoming kinder day by day, and took more interest in the welfare of the family. The mother had less work, and Grace often felt the blessings of living in a real happy home. George bore the dignity of his position modest-

ly and no gusto, or "I told you so" ever escaped him, though it is needless to say that he felt a just pride in seeing the successful culmination of his plans.

At last the day came when the three years were up. The note which had been paid two years before, without George knowing it, was put into his hands by the farmer with the statement, "There's your receipt, George. Also, here is another little thing that is coming to you. On looking, George saw that it was a check for \$1,000. That's one thousand toward that twenty-two thousand dollar balance, the value of the education you are going to get," said the father with a twinkle in his eye. Also, you deserve that, and much more, which you shall get in time. Your foresight and enthusiasm have organized this farm and its management until it has been put on a paying basis. The mortgage has been lifted. The debts are wiped out. The  $7\frac{1}{2}$  per cent saving on shedded machinery has grown into the interests you said it would, by the saving of machinery from wreckage and the saving of livestock. I shall now manage the farm alone, and hire what help I may need. You may begin your University course this year, if you desire, and," turning toward his daughter, he added, in his characteristic rough way, "Grace, mother and I have noticed the enthusiasm with which you followed George in his Correspondence College work and we have decided to permit you to accompany your brother to the university if you desire to do so.

Grace wholly unprepared for, and unsuspecting of such a turn of events could say nothing for fully half a minute. Then she could only say, "Why father, why mother, how can you spare us both! O this has been a cherished desire of my heart that I dared not utter"—and she sprang toward her mother and father and—the happy scene that followed was a sacred one in the family to which we can not be introduced.

Within a few weeks the "young folks" of the Bolton homestead were in the University. The father and mother were lonesome, O so lonesome, but yet they were happy. The letters received twice each week told of the experiences of George and Grace at the University and of the pleasures of the work there. The holiday vacation found them at home where contentment and happiness reigned supreme. They, both, spent their summers at home at their usual farm pursuits. The farmer and his wife noticed that the children had not changed in any way except in culture. They were in the same joys of the household that they had been for the three or four years past and gave no evidence of falling into the boisterous and evil ways that sometimes come to University students.

Within the required time both George and his sister received their degrees and returned to their home on the farm. George entered into the duties with new zeal and determination, and Grace filled the house with such joy and happiness as only a true,

active and loving farmer sister and daughter can. Contentment reigned in that family because they were happy and prosperous. The father was out of the rut and was as happy as any of the family, and spent his evenings with the family in conversation, or discussion, or in reading. The mother was the happiest of women. Once she was heard to tell a neighbor that the only fear she had had of educating her children was, the fear that "their education would lead them into professional life and away from her. But," she added, "this has not happened. They have returned to father and me to lighten our path and bless our home."

True this young man and this young woman each had offers and opportunities to enter the professional field, but they had talked the matter over often, and had finally concluded that their greatest compensation lay in remaining at home and caring for their parents, where, they felt they could do as well as anywhere. And so they staid at home. And we take our leave of a family which has found the error of its way and is living in the joy made by the wake of its finding. If this family's example could be portrayed in every home where it is needed, what influence it would have! What a teacher this young man would be! Here we leave them for their subsequent success and fame does not enter our story. I wish only to add that the young man's future is bright as has been shown by recent events, and Grace,—well, she is all right too.

*E. St. Louis, Ill.*

#### FARMS IN ALASKA.

By a recent order of the Secretary of the Interior, 2,980,000 acres of land has recently been opened for settlement, only about fifty miles south of the Arctic Circle. This land has been held in reserve for a National forest around Norton Bay, but the project was abandoned, so many were the demands for entry on land which had been found more suitable for settlement. The rush to Alaska last spring overwhelmed steamship accommodations and filled up the wharves at Seattle with household freight, but the order of the Secretary is expected to prolong.

Agriculture in Alaska is proceeding hand in hand with the efforts of the government experiment stations which are constantly determining what will grow there which heretofore has been considered unsuitable either to the soil or the climate. So far, all the hardier vegetables have been made to thrive and in the large valleys of the interior experiments are being made, with every prospect of success, to grow hay, grain, and stock feed capable of maintaining work animals. The great valley along the Sultana River in Central Alaska, extending north from Cook's inlet and Resurrection Bay, it is declared, has a mild climate the year round owing to the warm currents of the ocean and will grow almost anything that is raised in temperate zones.

The permanent white population of Alaska is now 33,000 with 6,000 natives at work here and there. The increase now averages 3,500 a year which the opening of the lands for settlement is expected to swell materially.

The people of Alaska shipped to the States last year \$29,339,286 worth of gold, silver, copper and merchandise in the form of fish products. Cable, telegraph and mail connections are being generally extended and already Alaska is ambitious to become a State.

### THE WORLD'S WHEAT LANDS.

About eight years ago, Sir William Crookes, England's famous physicist, predicted that not later than 1931 the world's wheat lands would be exhausted. He showed conclusively enough that the Canadian province of Athabasca for more than 125 miles west of its eastern boundaries was an extension of the wheat soil of Manitoba, the climate favored wheat culture into Athabasca. Crookes thought that the capacity of Australia was greatly exaggerated but the British authorities proved that 50,000,000 acres of good land were still uncultivated in Queensland alone.

According to Herr Kaerger, a noted German scientist, only one-sixtieth of the surface of Argentina is under cultivation; that the great fields of wheat and maize and the vast pasture grounds are to be found chiefly in the east, is to be attributed to the fact that Argentina holds business relations with the rest of the world principally through the ports of Buenos Ayres and Rosario. Herr Kaerger says that the Eastern limit of Argentina wheat culture without irrigation is the frontier between Argentina and Uruguay, followed to a point between the provinces of Entre Rios and Corrientes. The unirrigated wheat land will follow the line of regular annual rainfall sufficient to mature the crop until it meets the arid belt. The Western boundary will pass Southeast of Cordoba to Villa Mercedes in the province of San Luis. The Southern limit will be a line connecting South of the city of Buenos Ayres.

From this it would follow that the great wheat area of Argentina would include the whole of Entre Rios, nearly all of Santa Fé, a portion of Corrientes, the East of Cordoba and the northern part of Buenos Ayres. Within this territory the available wheat land has an acreage of 200,000,000 acres. Argentina can produce at least twenty-four times as much wheat as she is now growing. All this duly considered and then the vast undeveloped wheat lands of the United States, Canada, British Northwest Territory and Alaska, it will be needless even for the people of the remote future to worry over the possibility of the exhaustion of the wheat lands of the world.

### A Holy War in Morocco.

Altho, so far as the French and Spanish troops have been concerned, matters have generally been fairly quiet in Morocco during recent months, the rivalry of the Sultan, Abd-el Aziz, and his brother, Mulai Hafid, the pretender in the South, has continued with more or less fighting. Now the rumors have been confirmed that, on January 4, Mulai Hafid, who had already been proclaimed Sultan at Morocco City, was so proclaimed at Fez, the northern capital, and that Abd-el Aziz was proclaimed formally deposed, and a holy war was declared. All the Moorish formalities attending such ceremonies were scrupulously observed, with the aid of the Ulemas, or body of Moslem doctors of the Choffas tribes, who interpret the Koran. The proclamations were issued at the principal mosque. The ground on which Abd-el Aziz was deposed was that he had sold himself to the Christians, since he had agreed to the installation of the international

police in the coast towns, as provided in the Algeciras agreement. The fanatical Moors hate Europeans, and the idea that Abd-el Aziz was ready to turn their land over to foreigners has aroused them to fury. Whether either Sultan is strong enough to get rid of the other is problematic; but the result of Mulai Hafid's move will be to keep the French and Spanish forces on Moroccan soil indefinitely.

### COLOR OF EGGS.

At the California Agricultural Experiment Station, the chief object in making a chemical examination of brown-shelled and white-shelled eggs was to determine whether there is any superiority of one over the other as to quality. The test shows that the shells and their color have but slight effect on the food value of the eggs. It has been said by some that the brown eggs are richer than the white ones, but this statement is not borne out by a chemical analysis, and the physical examination proves that the main points of superiority, though slight, are possessed by the white eggs. The minute differences that are found between the two groups are exceeded by variation between varieties within the same group. It may be stated that there are practically no differences so far as the food value is concerned between white-shelled and brown-shelled eggs.

### HISTORICAL NOTES.

BUTTER is first mentioned in the Bible in Gen. 18: 8. It was made from the milk of goats and sheep, and later from the milk of cows. The way they made it was to put the milk into skin bags, and shake them until the butter came. Arabs to this day make butter in this primitive manner. In ancient times butter was used for food, medicine, and for burning in lamps.

History does not tell us in which country cotton was first used, but the writings of Herodotus and Pliny speak of the excellence of the cotton fibre used by the Greeks and Romans. It was used by the Indians when Columbus discovered this country, and prehistoric Peruvian mummy cloths were made of woven cotton.

Indian corn originated in America, and when Columbus reached our shores the Indians were cultivating it. In 1535, when Cartier visited what is now called Montreal, that city was surrounded by corn fields. The tombs of the Indians preceding those of our day contained ears and grains of corn.

Mr. E. W. Quincy, of Illinois, invented the first corn harvesting machine in October, 1850

TWENTY years time proves that most men either lose their hearts in adversity or their heads in prosperity.

You must believe in yourself before anybody will believe in you.

## CREAM OF MAGAZINES

### JUDGE CLELAND AND CHICAGO'S FOUR HUNDRED.

The municipal courts of Chicago have been in operation not quite a year. Of that new system as a whole it is not my present intention to write. But there is one branch of that court which has been in operation even a shorter time than a year, of which I want to tell something. I have just sat on the bench beside Judge Cleland as he issued his one thousandth parole, and that is a good time to take account of stock. From 9 o'clock in the morning until 3 in the afternoon, with never an intermission save five minutes for a glass of milk, the judge sat at his desk, and I sat with him while the docket ground its course.

When Judge Cleland took this court last February, under new power given the city in the matter of its courts, he had no new body of criminal law to administer. The same old laws are on the books that have grown up out of the cruel experience of the ages. And these laws compelled him to do many things which he did not want to do, and he is a believer in the enforcement of every law, good or bad, so long as it is a law. It seemed to him that in some way the operation of the criminal law should be constructive, and he found it only punitive. It seemed to him further that revenge should be eliminated.

Theoretically there is no revenge in the enforcement of law; but practically most laws are not enforced unless some one prosecutes. It seemed to him also that convictions should be far more certain in cases where guilt is proved, but that so far as possible needless disgrace should be spared.

He got together seventy-five men, lawyers who practice in his court and business men of the district, and told them what he was trying to work out, and they agreed to help him. Each of the business men agreed to be an elder brother to some tempted man. The number of elder brothers increased till now there are four hundred. These are the Chicago Four Hundred, and Judge Cleland is their leader.

Let me describe some of the cases I saw and heard. This, for instance, happened to be the one thousandth: A man was brought in drunk last night. He had spent the night in the cell. He stands before the judge, barely sober. It is his first arrest. He is married and has five children, the oldest thirteen years of age. He speaks a little English. He gets drunk habitually, and his family is very poor, but he is not boisterous, and would be a decent man if he would let liquor alone. The law gives little liberty in such a case. He may be found not guilty, and sent home with a lecture, or he may be fined, and since he has no money, he may be sent to the Bridewell to work out his fine at 50 cents a day, his wife and children subsisting on charity while he is in jail. That is all that the law provides for such a case. And in a city not far away from Chicago on one morning only a month ago, 167 cases, of which this may be regarded as a fair speci-

men, were ground out in ninety minutes; a rate of speed, as Judge Cleland, remarks, just about equaling that with which they dispose of hogs at the stock yards.

Judge Cleland asks, "Where is this man's wife?" She is not here. The man is sent back to his cell for an hour or two till the officers go out and find his wife. Meantime the court goes on. At length the woman appears, accompanied by the eldest child, a girl of thirteen, but looking as if she were eight. She and her mother wear shawls over their heads, and they stand, stolid, beside the husband. An interpreter is necessary for a time, but soon the little girl is discovered to speak good English, and the judge's lecture becomes the more impressive when interpreted to the parents by the child. The mother, too, drinks, but not usually to excess. The judge tells them that the easiest thing for him to do is to send the husband to the Bridewell and be done with the matter; but that if the man is sorry, as he says he is, and will promise faithfully never to touch liquor, to go back to work and take care of his family, he will not punish him. The promise is made very readily, and the man is released on parole. But this is not the end. The court sentences the man to the maximum fine and imprisonment. He then considers that a motion is made to vacate that sentence. He postpones action on this motion for two weeks, and releases the man on his own bond of \$200 to appear at that time. In order that he may not lose time from his work, he is to come to a night session of the court, and bring his wife with him. They are then to tell him how matters have gone. If they are going well, he will continue the motion another two weeks, and so on. If, however, the man has been drinking, the bond is forfeited. Moreover, if any of the officers see him enter a saloon for any purpose, they are charged to arrest him. Positive legal evidences of intoxication are no longer necessary. It is incumbent on him to "make good." The condition of the children became matter of inquiry. This little girl of thirteen has never risen above the second grade in school. She ought to be farther along. She is not in school at all, having been in the parochial school, and now being at home in order that her mother may work out. The judge declares this must stop. The man must support his family and send his children to school. He must no longer compel his wife to work out and his children to stay home that he may drink. And he will send some one to the home to keep in touch with matters there, and see that things improve. The parents must seek the moral betterment of their children, and the judge is in condition to compel it. That suspended sentence hangs over the man just as long as the judge cares to continue the motion to vacate. That is what gives power to the pledge. For the mere promise of this poor, crushed, ignorant man is as worthless as his \$200 bond, save for the power which is to compel him to come in from time to time, and to go to jail if he does not "make good." This was the one thousandth case; and I talked with the blue-eyed little figure in the shawl, the eight-year-old girl that had lived thirteen

pitiful years, and thought there was good reason to hope that better things were before her. She is going into the public school now, and is to have a chance to live.

A red-faced, sullen, brutal-looking man, not yet as sober as he ought to be, stands before the desk. He has been in the Bridewell more than once, and it did him little good, if any. He will not work, and he will drink. The rent, which is \$7 a month, is not paid. The furniture was bought on the installment plan several months ago and cost \$90; of this \$24 has been paid, and the payments have ceased. Last night the furniture firm sent a wagon and took every article of furniture out of the house. The landlord is here to say that he will on no account take the family back. The wife, with an infant in her arms, has no hope in her face. She stayed last night with a sister, but can stay there only a day or two.

"Did you get any good out of the Bridewell?" asks the judge.

The man answers that each time he came out he was sober for a few weeks.

Is he ready to go to work and be a man?

He returns a shuffling and evasive answer.

The judge continues the case for two days. The man is led to his cell. But the judge is not thru. He addresses the landlord:

"I want you to take this family back."

"Your Honor, they're no good. That man will not work. I'll never get my rent."

"I will guarantee the first month's rent," said the judge. "Will you take them back?"

A reluctant consent is given.

"Call up Klein Brothers, and tell them I mean to compel this man to work and pay the balance due on the furniture. Ask them if they will send the furniture back this afternoon."

In a little while, during which interval other cases have come to the front, the word comes that Klein Brothers are very glad to do as the judge suggests. And the judge thinks he sees a way to make a home out of those poor, wretched lives.

Two brothers committed a burglary. They were guilty, and there would have been nothing to do but to bind them over to the Grand Jury, and have them sentenced to the penitentiary for from one to fourteen years. The judge sent out and found the parents more to blame than the boys. He bound the boys over to the Grand Jury, considered a motion as made to vacate that decision; compelled the father to give bonds for the boys, and the boys to go to work and repay the cost of the articles stolen. He brought the whole family up once in two weeks. The boys are off the streets and at work. And every one is satisfied. There is no probability that the Grand Jury will need to investigate that case.

There was a man who was not decent, who had abandoned his wife, less decent, and she had him arrested for wife desertion, which now in Illinois is a criminal offense. They had six children. The judge gave him the limit of the law; sent him to work, and compelled him to make report: he is now earning \$13.50 a week and she is keeping the house, and the judge thinks it better than that the man should have gone to jail and the woman to the — and the children to the orphan asylum.

A boy was brought up who had a bad record. His father was sent for, and would not come.

Then the judge issued a summons, and still the father would not come.

"Send him to jail," said the father; and then added, "Send him to — for all I care."

The judge made some remarks which he thought suited to the occasion, and issued a bench warrant for the father. He compelled the father to give bonds for the boy, and warned him that for any act of wantonness committed by the boy the father would be made to suffer. Then he sent them both home and now brings them up once in two weeks, and it is surprising how much interest the father now takes in his boy. Judge Cleland says he is in some danger of putting the Juvenile Court out of business by his prosecution of the parents of bad boys.

Cases of this kind multiply so that I cannot tell many more of them. But a word ought to be said about the night sessions of the court. There are so many of them now that the judge himself cannot attend them all; and his head probation officer presides over some of them. The people come, husbands and wives for the most part, and tell how they are getting on, and if they are doing well the cases are continued for two weeks more. The judge gives fatherly and encouraging talks, little heart-to-heart sermons, to different couples; then they have some music. There is a piano in the judge's chambers, and it is wheeled out for these night sessions. There are some flowers on the desk, and the occasion is a sort of judicial church social. And the people who are trying to do better encourage each other, and thank the judge and sing "America" and go home.

Some of Judge Cleland's penalties are not in the statute books at all. He tells a woman she must clean up her house; and he has the probation officer report on its improved condition. He tells a man that he must move to a better home, and pay a little higher rent in order to get a chance for his children to keep clean. He will not let a boy out who will not promise to stop using cigarets. The way in which these conditions are fulfilled is his material for judging whether to vacate the judgment inflicting the penalty. That penalty hangs over the guilty man till the judge is sure his reformation is complete.

"The old way is not equitable," said the Judge. "Within a month in the same court in a certain city two men were fined for the same offense fifty dollars each. One of them ostentatiously paid his fine out of a one thousand dollar bill. The other went to Bridewell to work one hundred days, paying that fine at fifty cents a day and coming out disgraced. And before he got out of jail his wife and four children arrived from Italy, and found themselves homeless and alone in a strange city."

"Within a month a woman was arrested dead drunk and sent up for forty days to work out a \$20 fine. Five days later, in a little hut on the banks of the canal, six children were found nearly starved; they were her children. And her crime of drunkenness was less than the crime of the State against those six children. If in some way the mother could have been saved, that would have saved the children."

What proportion hold out? Of his one thousand and seven or eight paroled men, up to this evening, seventy-seven have fallen. And these men go to the Bridewell for the limit. Two of them came up this morning.

"Didn't you promise me faithfully that you would not touch a drop of liquor; that you would be good to your wife; that you would support your family?"

"Yes, sir, but I thought it wasn't much harm to drink a little."

"You thought so, did you? Well, you shall see! Do you remember what I promised you? I promised if you broke your promise you should go up for six months, and that is just what I shall do. I keep my promise."

—The Independent.

# Echoes from Everywhere

## FOREIGN.

### England to Defend Africans.

Word from London indicates that England will force Belgium to give more just rule to the Congo State. The Congo reform associations in the United States and Secretary Root were invited to join in the measures.

The resolutions denounce the proposed transfer of the Congo independent state to Belgium and demand that the British government proclaim an early time limit within which Belgium must produce a plan of annexation providing guarantees, a complete reversal of the claims and practices of the existing system, the restoration to the natives of their rights, and the abrogation of slavery and enforced labor.

If Belgium does not adopt such a scheme, the resolutions declare, the British government should appeal to the powers for joint action.

These resolutions are intended to strengthen the hands of Sir Edward Grey, the British foreign secretary, who is only awaiting definite action by the Belgian government and chamber before intervening.

### A Revolution in India.

That the 300,000,000 natives of India, inspired by the success of Japan in the war with Russia, are preparing to strike a blow for freedom is the opinion of Captain William Rohde of the German steamship Neidenfels, just in from the Orient. The Captain says:

"In the Punjab district the agitators are urging the natives to open revolt. The white man throughout the East is no longer looked upon as the natural lord and master.

"It is generally believed among the natives that what the Japanese did the Indians can do also, and it will not be very long, to my mind, before there will be serious trouble all over Asia."

China showed signs of national progress when the throne recently declared a constitutional government for the people at an early date.

The edict declares that the chief problem relates to the control of agitations, and orders the boards of the interior and justice to name a constitutional commission to frame a law for the regulation of political societies.

The day when we shall go on Sunday-school picnics in airships may not be so distant, after all. Count Zeppelin, the German aeronaut, is proposing to build an airship to carry a hundred persons. Experts believe that he will succeed.

A bill has been passed in England making women eligible as county and town councilors and aldermen. This will greatly increase women's opportunity for usefulness as members of school boards.

The commission appointed to revise the constitution of Holland recommends the extension of suffrage to women.

Rumors of a republic for Portugal continue since the killing of King Carlos. All political prisoners have been transferred to the prisons in Africa for fear they would escape and aid the revolution. Martial law prevails all over the kingdom.

The South American republics, during the next fifteen years, will be engaged in celebrating their centennial anniversaries. The first of the lot, Ecuador, will open an exposition Aug. 10, of this year, at Quito, to celebrate her hundredth birthday. Secretary Root has asked Congress to appropriate \$50,000, to enable our Government to be represented there. As arguments for our participation he advances the facts that Ecuador's largest foreign trade is with the United States; that she is one of the richest countries in Latin America; that a railroad managed and constructed by Americans is about to be opened connecting Quito with the sea, and that the interests of American exporters will be furthered by a creditable display at this exposition.

## GENERAL.

### When Weddings were Costly in Texas.

The Austin correspondent of the St. Louis Globe-Democrat says: "The marriage of Dr. and Mrs. Jones took place in Austin in May, 1840. The wedding trousseau was brought all the way from Houston to Austin, a distance of 186 miles, by ox-cart. Mrs. Jones still has a receipt showing the freight charges upon part of the goods which were transported in this manner. The hauling of one pair of white silk hose from Houston to Austin cost \$9; black cotton hose, \$3 per pair; inserting, \$1 per yard; chally, \$3 per yard. The goods were not transported at a cost of so much per weight, but the freight charges were made according to the value of the articles."

The constitutional convention in session at Lansing has adopted by a vote of thirty to nine the following preamble to Michigan's new constitution: "We, the people of the State of Michigan, grateful to Almighty God for the blessings of freedom and earnestly desiring to secure these blessings undiminished to ourselves and our posterity, to that end do ordain and establish this constitution." This has a tone of puritanism which is not as common as it was with earlier settlers of America. "The powers that be are ordained of God," especially when they are powers for good.

### Kidney Disease a Result of Poisonous Food.

That the American kidney is being undermined by poisoned foods was asserted by Dr. H. W. Wiley, chief of the United States bureau of chemistry, who addressed the House committee on agriculture. He told of the results of experiments conducted by the bureau to determine the

poinsonous effect on the human system of such drugs as borax, benzoic acid, benzoate of soda, sulphate of copper, sulphur dioxide, formaldehyde, and salicylic acid when contained in food stuffs.

Dr. Wiley said that the expulsion of those and kindred drugs from the body is performed almost entirely by the kidneys, and that he is satisfied the term of American life would be lengthened if the use of such drugs in foods were wholly discontinued.

Rabbi Samuel Schulman of Temple Bethel, New York City, in an address at the monthly dinner of the Knife and Fork Club, spoke on "Money as a Measure of Manhood." He declared that money is becoming a national idol in the hearts of the majority of Americans. This rush to gain wealth, he said, "is the bane of a one-sided triumph of a material industrial civilization."

#### WOMEN WHO WANT TO VOTE.

New York suffragists are prosecuting their cause with zeal that indicates earnestness and ability. A delegation of English suffragists to this country recently fanned the dormant flame of equal franchise in this country into life. Woman's rights are gaining ground rapidly in the civilized world without question. Whoever took her franchise away from her, or by what rightful authority it is now withheld from her is hard for man to answer without convicting himself.

Secretary of State, Elihu Root, gave a letter of indorsement to a committee from the National Temple of Labor Association, which has been organized to raise a \$1,000,000 fund to construct in Washington a magnificent temple for labor organizations, and which purposes to interest business men and representatives of organized labor in joint efforts to minimize business losses and other social ills "resulting from such crude agencies as the strike, the boycott, and the lockout," and to secure a more general application of arbitration and community of interest of capital and labor. President Roosevelt, Vice-President Fairbanks, members of the Cabinet and Supreme Court, public officials generally, and prominent labor leaders and employes are being interested in the project. It is said that every member of the Cabinet has approved the project except Secretary Taft, who has not yet returned his final answer to the appeal.

It seems probable that Congress will authorize the issuance of money certificates during panics upon city, state, and railroad bonds. Why railroad bonds are better than some other commodities and business papers is a mystery to some. A certain class of New Yorkers and United States Senators hold most all the railroad bonds in the United States. It's a handy way for them when in need, to issue money and run their business and loan to others. Strange that they are the only ones who will be allowed to do this. If there were a majority of farmers in Congress it is possible that so much money would not be issued on railroad bonds. The total amount to be issued at any time is \$500,000,000.

The grip has had an extensive recrudescence this year. In more than one place it has interfered with the work of the schools. In Washington the health authorities put the number of cases at fifteen thousand at the new year. A fifth of the clerks in some of the government departments were away from their work on account of it. In Pittsburg the epidemic has been the worst since 1889.

#### \$124,000 FOR A BOOT-BLACK STAND.

Most people are on the lookout for big things, especially big bargains in money making, but the little things in life have a value also. This was brought out in a surprising way recently when a syndicate bought the exclusive right to black boots in the Pennsylvania terminal depot in New York City at a cost of \$124,000 for ten years.

Unless 1,000,000 people patronize the stand it will not be a financial success, but since 25,000,000 and over pass thru this depot within the year, it seems probable that the undertaking will prove a success.

#### SAFETY OF LIFE IN THE SOUTH.

The Charleston, News and Courier, in a remarkably frank and courageous editorial, declares "the sin of the South to be blood guiltiness. This State is stained with blood from the mountains to the sea." To sustain the assertion it gives figures, compiled from the newspapers, of the number of homicides committed in the State in the last six months of 1907. In that time an average of one man was killed on every weekday. Of the 158 men killed seventy-nine were whites and seventy-nine negroes; of the slayers seventy were whites and eighty-five negroes, and three unknown. One hundred and twenty-one of the dead were killed by gun and pistol shots, a fact which shows how common is the carrying of the deadly weapon. Pistols are made and carried for the purpose of shooting men. To carry them without a special permit is against the law. Murders and shooting are by no means limited to the South, of course, but the fact that the Italian Government has advised Italian immigrants against settling in at least one of the Southern States, is a straw that indicates something. The notorious acquittal of Judge Hargis, when charged with complicity in the slaughter of his opponents in Breathitt County, Kentucky, hints at the reputation of that State all over the world. The sentiment which still prevails among many southerners that a man can shoot any one who calls him a liar; that he can shoot any one who is charged with wronging a woman; and that he can kill a "nigger" without suffering for the crime, all need to be extinguished.

#### A SERIOUS QUESTION.

Many of the gifts—the larger ones to colleges and universities—are made in the form of corporation stocks and bonds. Of course, it is not supposed that these stocks will be converted into cash at an early day. A simple comparison of the prices of these stocks and bonds a few months ago, with the present quoted prices, suggests what would happen if a university were suddenly compelled to turn its securities into cash. It would be several hundred thousand dollars poorer and its income would be so crippled as to compel immediate liquidation or suspension at least, altho its dormitories and recitation rooms might be crowded with students. This is a practical view of the case and shows how it has happened that so many banks and other corporations have failed, or gone into the hands of receivers recently. They may have had the securities, but nobody would buy them, and so they have been unable to turn their securities into cash to meet the sudden and unexpected demands in addition to their usual obligations for the payment of employes and the purchase of materials to carry on their business. Business in full progress with unparalleled prosperity has been arrested; supplies of all kinds are put on the market without finding purchasers, and a general reduction and lowering of prices is the result.

**KING CARLOS ASSASSINATED.**

Once more despotism has reaped its own harvest in the assassination of the King and Crown Prince of Portugal, February 1, as the royal family was riding through the streets of Lisbon.

King Carlos had grown more despotic of late years. He had dissolved the national congress and was the puppet of a dictator, who ruled with ancient splendor and tyranny. The populace became tired of such a state of affairs, but there was no legal way to change matters before his death. Discontent was increasing every day.

Three anarchists ran out of the crowd of onlookers, ran up to the King's carriage and shot both the King and his oldest son, and wounded the second son. Threats had been made and the police were cautious, but the murder came so unexpected and sudden that the officials were dumfounded until the fatal deed was done.

The murderers were caught and brutally put to death by the angry mob.

The second son, 19 years old, was proclaimed King of Portugal the next day. Constitutional government is promised, and England and Spain are lending military and civic aid in the hope of restoring public order. It is said that the dead King had become very immoral and unchaste, was a spendthrift and had lost interest in his subjects. People will bear about so much tyranny and then comes tragedy.

**THE PRESIDENT'S SECOND MESSAGE TO CONGRESS.**

Washington, D. C., Feb. 5, 1908.—No state paper for a generation past has caused more comment, pro and con, than the message which President Roosevelt submitted to Congress last week.

In that paper the President fearlessly accuses the Santa Fe Railroad and the Standard Oil Company with fraud and untruthfulness and for proof against the first company named he submits a letter from President Ripley of the Santa Fe road, in which Mr. Ripley had directed rebates to be paid to a certain corporation, which, after his being fined for such criminal practice, he told the public that he was unaware that any rebates were ever paid to his patrons by his road. The letter which he dictated and which President Roosevelt now holds goes a long way toward initiating Mr. Ripley into the Ananias club for the remainder of his life.

The President's message reveals his sincerity for fairness to rich and poor alike, without showing any signs of prejudice at all. He openly declares that it will be better to allow the railroad magnates too liberal a rate for work done than to skimp them too much, because, with liberal pay they will develop their roads, while, if their earnings are short they will cut wages and fail to accomplish much good for the country. Such a declaration does not sound like he is merciless toward wealthy people as some papers have claimed.

Other good features brought out in the paper are these:

Immediate reenactment of the employers' liability law, with present objectionable features eliminated.

Compensation by government to all employés injured in service.

Federal supervision over financial and physical operations of interstate railroads.

Amendment of Sherman anti-trust law.

All gambling in stocks and securities should be prohibited.

The message has both a legal and a moral tone that is commendable. Equity and justice with a humane regard for all classes is its keynote.

**THE ARMY TO MOVE TO THE PACIFIC COAST.**

San Francisco, Cal., Feb. 5, 1908.—Not only has the largest fleet in the world sailed for the Pacific Ocean, but the War Department is moving the army thitherward as well. The army is to be mobilized at San Francisco and Seattle by the time Admiral Evans' fleet reaches these points in April. The forts in Kansas, Nebraska, Wyoming and other western states are to send heavy detachments forthwith. What the aggregate number of soldiers will be that will finally be collected on the coast is unknown, and the primary object can only be guessed at.

A great many liberties have been taken by Japanese immigrants along the coast of late years which has led them to believe that Uncle Sam is a coward. President Roosevelt is evidently preparing to dispel such a dream by preparing for business in Japanese style, altho no sane person sees any war between the two countries further than a commercial war for the trade of the Pacific.

Another war star is also seen by the fearful and jingoists in the fact that an up-to-date port is to be built at Honolulu. This is another of Roosevelt's tactics to offset the egotism of Japan in good time. With these vast movements it is evident that for the first time in history the world's business has been transferred to the Pacific Ocean. This is not only an epoch in United States History, but a new era in the history of the world. The final solution to the entire movement is found in the fact that increased industrial and commercial interests on the shores of the Pacific calls for more attention, both military and legislative. While the Atlantic was our only commercial field the entire navy remained there, but with the diverting of trade to the Orient it is only fair that the navy and the flag be transferred to where our new interests are opening up.

**WHISKY ON TRIAL IN MICHIGAN.**

Lansing, Mich., Feb. 5, 1908.—"The manufacture and sale of malt brewed, vinous, and intoxicating liquors shall be forever prohibited in the state after May 1, 1909, except for medical, scientific, sacramental, and medicinal purposes."

This is the drastic prohibition proposal that was unanimously and favorably reported in the constitutional convention by the committee on liquor affairs.

Those states which have had prohibition the longest have the largest bank deposits per capita. Michigan is headed in that direction at present.

The constitutional convention committee on elections also unanimously reported a proposal granting woman suffrage, with a recommendation that it be passed.

**OKLAHOMA'S CIGARETTE LAW.**

Guthrie, Okla., Feb. 5, 1908.—The lower house of the Legislature has passed a measure prohibiting the smoking of cigarettes in the State. A fine of not less than \$5 nor more than \$25 for each offense is the penalty. This is the fourth score in favor of Oklahoma, the other three being prohibition of liquor, guaranteed state banks, and federal control of all corporations.

**TWO NOTED PERSONS DIE.**

MacDowel the most famous of American musicians died in New York last week, aged 46. He had been insane for three years past.

Louise Ramee, who wrote forty-one books under the name Ouida, died in extreme poverty last week in Italy. She received \$500,000 from the sale of her books but the love of dogs, sport and gaudy dresses took it all.

## Ropp's New Commercial Calculator and Short Cut Arithmetic

The Standard for Store, Farm, Bank or Factory,

5 1/4 x 2 3/4 in.

Is from beginning to end a greatly improved, enlarged and thoroughly revised publication.

It contains an entirely new system of unique Tables, Short-Cuts and up-to-date Methods.

It is unquestionably the most complete, useful and comprehensive Calculator ever published.

It has more than twice the matter, scope and capacity of Ropp's former editions, of which

**Nearly 1,500,000 Copies have been Sold.**

It is the most convenient and practical Labor-saving work ever used in the business world.

It will make every one independent, sure and self-reliant in all practical calculations.

It will prevent mistakes, relieve the mind, save time and labor, and often loss and trouble.

Its Tables are adapted to all the trades and occupations in the city and country, and

### Show the Answer as Quickly as a Watch Shows the Time.

It also explains and simplifies the principles of Arithmetic, Mechanics and Mensuration.

It will make the study and use of Figures easy and interesting for young and old.

It will enable every progressive mind to become an expert, sure and rapid calculator.

It will prove a boon to all whose education in arithmetic has been limited or neglected.

**48 Cuts Illustrate the Elements of Mechanics and Mensuration**

It defines about 70 points in "Commercial Law" which every man and woman should know.

It is the result of devising, and improving system after system; of spending thousands of dollars in experimenting; of making millions of miscellaneous calculations, and of doing some vigorous thinking during 38 years, by an analytic, practical and persevering mind.

### It is Especially Designed for

Farmers, Mechanics, Business and Professional men,

**Office Edition (9 1/2 x 5 1/4 in.)**

Cloth binding, gold stamp, large type, .....\$1.00

**Pocket Edition (6 1/2 x 3 3/4)**

Cloth, with pocket, flap and silicate slate, ..... .50

Leather, with pocket, flap and silicate slate, gilt edge, ..... 1.00

**Vest Pocket Edition (5 1/4 x 2 3/4)**

Cloth, round corners, red edges, ..... .35

Leather, gold stamp, burnished edges, ..... .50

**BRETHREN PUBLISHING HOUSE,**

Elgin, Illinois.

## The Spirit's Sword

For all Ministers and Personal Workers.

By Evangelist J. R. Beveridge.

Vest-pocket Size, 2 3/4 x 5 1/2 inches. 1/4 inch thick. 128 pages, 1,200 Scripture references. 133 Subjects. Special Notes.

The  
Greatest Book  
out for  
Christian Workers

### Synopsis of Contents.

Importance of Personal Work. Personal Experience and Equipment, in the Holy Spirit, the Word of God, Prayer and Faith. Personal Conduct in dealing with Souls. How to approach persons. How to get cases.

The Fundamentals of Salvation Texts for Christians under all conditions of Sin. The Natural and the New Heart. The way of Life and the Way of Death. Hell.

Answers to nearly every question asked by Sceptics, and all classes of unconverted. False Hopes Swept Away. Guidance for those seeking to find Christ.

The Holy Spirit, Acts to 1 John. The Divine Nature of Christ. The Human Nature of Christ. A Personal Devil. Bible readings on Prayer and Thanksgiving.

### Price, by Mail, Prepaid.

Red Cloth, Embossed and Stamped in Black, .....25 cents.

Red Morocco, Embossed and Stamped in Gold, .....35 cents.

Address,

**BRETHREN PUB. HOUSE,**  
Elgin, Illinois.

### Souvenir Cards of

### "The Old Dunkard Church"

at Germantown, (Philadelphia) Pa.

Single copy, 5 cents; three copies, 10 cents; per dozen, 35 cents. Address

B. F. Kittinger

4114 N. Reese St., Philadelphia, Pa.

## CRADLE ROLL SUPPLIES

There is a demand for Cradle Roll Supplies coming from some of our wide-awake Sunday schools, and we are now ready to meet the demand.

**Every Superintendent and Teacher** ought to be enough interested in this new department to ask for particulars. Drop us a postal asking for our illustrated descriptive circular of these supplies. **DO IT NOW.**

Address,

**BRETHREN PUBLISHING HOUSE,**  
Elgin, Ill.

# Facts Regarding Imperial Valley

Some people in trying to induce their friends to settle in the country where they themselves are located, frequently send them advertising matter that is either false, misrepresents land agents that deviates from the truth. Their friends come and buy property and soon find out that the facts do not correspond with the advertising matter sent them. The result is they soon become discouraged and sell out at a sacrifice, and go back where they came from, worsted financially and in some instances say worse things of the country than they should, and thus bring reproach on a good country (though not as good as the advertisement represented it to be). The undersigned has known this to happen more than once, and for this reason, has decided to tell his brethren and friends about the Imperial Valley in his own words, so that he alone shall be responsible, and so that the wonderful Imperial Valley may never be made a reproach and a by-word.

Imperial Valley is situated in San Diego County, California, 183 miles east of Los Angeles on the Imperial branch of the Southern Pacific railroad. The soil is an alluvial deposit and all crops are grown by irrigation, with water from the Colorado River. The main irrigation canal is 80 feet wide on the bottom and 100 feet wide on the top, and 10 feet deep. The soil is adapted to the growth of wheat, barley, alfalfa and nearly all kinds of fruit. Alfalfa having plenty of water can be cut eight times per season, yielding as high as ten tons of nice hay per acre which sells at present from \$5.00 to \$11.00 per ton. Barley can be sown for winter pasture in alfalfa stubble after the last crop of hay is harvested. Alfalfa can be cut every three weeks if the hay is wanted for dairy cows, or every four or five weeks if wanted for horses. I have known of alfalfa yielding \$40.00 worth of seed per acre and my own yielded \$20.00 per acre with the first season's sowing. Dairying and hog raising are very profitable. Butter sells from 20 cents to 45 cents per pound; hogs, 7½ cents on foot; also beef, cattle and horses do excellently. One colt weighed 950 pounds at less than one year old. One acre of alfalfa will keep from 2 to 3 head of dairy cows or horses and from ten to fifteen head of hogs. Oranges, lemons, dates, figs, apricots, grapes and berries do well. A single grape vine has yielded 30 pounds of grapes 18 months from setting. Grapes, apricot and cantaloupe growing is very profitable as they will ripen here from three to four weeks earlier than other places, and be placed on the eastern market before they are ripe in other localities. One man at Coachella was offered \$600.00 cash for the grapes on a single acre of vines and refused the offer and sold at retail for \$1,400.00. Cantaloupes will net the growers from \$50.00 to \$300.00 per acre. I have lived in the valley as long as any one, being one of the first settlers, and my experience and observation has taught me that you can grow almost anything here you plant, including vegetables, if planted in the proper seasons and properly cared for. The selling price of land at present is from \$40.00 to \$100.00 per acre, owing to location. President Roosevelt says that when it is thoroughly developed it will be worth from \$500.00 to \$1500.00 per acre.

Reader, when you shiver around your fireside the coming winter, just think of the Imperial Valley where you can go in your shirt sleeves nearly every day in the year. And on the 10th day of this month (May, 1907), while there was a snow storm raging in many places in the eastern states, we were making hay and picking and eating fruit in the Imperial Valley.

## THIS IS A PROGRESSIVE AGE

**Everybody Wants the Best in  
Every Line**

**ANGEMA**—a jelly-like medicine—is representative of this fact in a medicinal way. It is not the quick result of an abrupt idea; but it is the PERFECTED PRODUCT of years of training and experience along a chosen line of work.

The RAPIDITY with which people are doing away with old time SALVES and LINIMENTS and using **ANGEMA** proves conclusively that they appreciate our efforts in helping them keep abreast with the times.

**ANGEMA** takes the place of a SALVE.

**ANGEMA** takes the place of a LINIMENT.

It thus serves a TWO-FOLD purpose.

Its REAL VALUE is shown in the TREATMENT of Rheumatism, Neuralgia, Headache, Sprains, Frosted Feet, and, in fact, wherever it is necessary to use either a SALVE or a LINIMENT.

**ANGEMA** is greatly prized where there are CHILDREN. It keeps away CROUP, LUNG FEVER, and COLD on the BREAST or in the HEAD. MOTHERS who use **ANGEMA** in these DISEASES would not be without it.

A 25 CENT TUBE OF **ANGEMA** sent for 15 cents if your druggist does not have it.

We want some one in each community to represent us in our business which they will find CLEAN, HONEST and PROFITABLE.

We want to hear from YOU. May we send you PARTICULARS?

**THE ANGEMA LABORATORY,  
Garrett, Pa.**

## LOMITA, CALIFORNIA

1. Situated four miles from the ocean, and near San Pedro Harbor. Rich soil, excellent natural drainage. Can grow crops 12 months in the year.

2. Three wells of soft water for irrigation and domestic purposes. Water piped to each one's land. Settlers to own all water systems.

3. Natural gas comes up with water, and is used in engine to pump the water, making the expense of lifting quite nominal. Gas leaves the water on reaching the air, hence pure water.

4. Markets at the front door and back door; land and water transportation to all the world.

5. Grain and corn raised without irrigation. Crops from October to May, barley, oats, wheat, onions, cabbage, beets, peas, cauliflower, radishes, citrus and deciduous fruits, nuts, and vegetables in their seasons. Government analysis of soils shows much of this land very fine for oranges and lemons.

6. Six lots donated for German Baptist Brethren church. Good opening for business. No saloons, no pool rooms can be operated on these lands.

7. All kinds of produce bring good prices, at San Pedro Harbor and Los Angeles. Profits from \$100. to \$500 per acre per year. Settlers arriving right along. This colony sure of success, as it has the soil, the water, markets, the push and a twelve months' climate to grow useful things.

Price .....95 cents.  
Postage .....13 cents.

BRETHREN PUB. HOUSE,  
Elgin, Illinois.

## Olive Branch of Peace

Valuable Contribution.

Dear Brother Hays: I have ordered a copy of your book, "The Olive Branch," and have read it with exceeding interest. It is a valuable piece of contribution, not only to the history of the Valley of Virginia, but also to the history of the Brethren Church and other peace loving societies of God's people. Especially is it valuable as a clear and full statement to the world of what the world is coming more and more to recognize as just, reasonable, and desirable—Peace, and the spirit of Christian peace. I pray and believe that by means of this book, "The fruit of righteousness is sown in peace of them that make peace."

Yours fraternally,

John W. Wayland.

University of Virginia, Charlottesville, Va., Oct. 29, 1907.

This book contains 232 pages, has a number of illustrations and is well bound in cloth.

Price prepaid, .....75 cents

### AGENTS WANTED.

We want an active agent in each congregation to push the sale of this valuable book. It should be in the hands of all of our people. If there is not an agent pushing the sale of this book in your congregation, and you could spare some time for this work, write us for terms. Do it now.

BRETHREN PUB. HOUSE,  
Elgin, Illinois.

and ¼ in. thick.

# ALBERTA

**¶ Of Alberta a distinguished writer has said:**

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

**¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.**

**¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.**

**¶ Why not join the colonies already there and enjoy some of the material benefits as well as help build up one of the largest and best colonies in the Canadian West.**

**¶ We have excursions every first and third Tuesday of the month.**

# CATARRH

And Head Colds

Successfully Treated With the New

## OX-O-NA-TER

The Only Natural Way

which will be sent to readers of The Inglenook on 10 day's approval.

It is folly to treat Catarrh of the Head by taking drugs into the stomach. Ninety per cent of the people are afflicted with some form of Catarrh. They are lying in storehouses, or distributing stations disseminating germ life, that breeds diseases from incipient Catarrh to quick consumption. Air is the agency through which these germs find lodgment in the air passages. Air should be the agency through which they are destroyed and removed.

**IF YOU HAVE CATARRH, LET ME SEND YOU MY NEW OXONATER ON 10 DAYS' TRIAL FREE.**

Then if you are fully satisfied with the benefit received from it—if you would not be without it for many times its low price, you can send me my special introductory price of Two Dollars. Otherwise return it, (postage 5 cents, which I will gladly refund).

Catarrh begins in the nose, but progresses rapidly to the throat, then the larynx, stomach, kidneys, leading to the dread tuberculosis. CHECK IT NOW. My Oxonater works on entirely new principles, delivering absolutely dry healing vapor directly to the inflamed surfaces. It is curing thousands of the worst cases. It costs nothing to find out if it will cure you. Valuable Catarrh Book free.

### A SQUARE DEAL GUARANTEED

Just send your name and address, naming the Inglenook.

I want you to try my OX-O-NA-TER 10 days, free, at my expense. You cannot afford to miss this opportunity. Don't think of missing it.

**Address today, E. J. Worst, 216 Main St., Ashland, Ohio**

### MAILED ON TRIAL FREE

We want you to try Pure Herb Tablets

#### TEN DAYS FREE

and prepare your system for the changeable weather of your climate.

## Pure Herb Tablets

Quickly relieve Constipation, Stomach and Kidney Trouble and Rheumatism.

No Alcohol, no Opiates, no Narcotics.

### 3 MONTHS' TREATMENT \$1.00.

If you have a stubborn case of Constipation, Rheumatism, Kidney or Stomach Trouble, or if you feel bad in any way, try Pure Herb Tablets. They are a wonderful treatment for the digestive system. They strike at the root and cause of the disease.

In most people Uric Acid is present in the blood, gradually accumulating as they grow older, and by lodging in various organs of the body, it causes disease. The blood grows old and impure, thus undermining the strongest constitution.

### SEE HOW EASY.

Just send us a mere postal card, mentioning the Inglenook and we will mail three months' treatment of our Pure Herb Tablet treatment. Use them ten days, if perfectly satisfactory send us \$1.00, if not, simply return the balance and you still have your money. We claim this treatment has no equal for above diseases, and take this honorable way to prove it to our patrons. Don't hesitate.

Speed the day by sending now to

**PURE HERB TABLET CO., 433 Main Street, Ashland, Ohio**

**AGENTS WANTED.**  
Not sold by druggists.

OREGON**

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

# An Elgin Boy Tells It As It Is

Macdoel, Cal, Jan. 25, 1908.

E. M. Cobb, Elgin, Ill.

Dear Friend:—We are having such good weather, and we are all feeling so fine, that it often makes me think of my friends and wish they were here to enjoy it all with us. I want to thank you, my dear sir and friend, for your help in locating me in such a beautiful valley as the Butte Valley.

We are located one and one-half miles south of the town of Macdoel. Our east line is the railroad. We certainly have a very fine soil. I will commence my apple orchard this spring, and hope it will prove as good as the others around here and then I will not have to worry about what I will do when I get old.

The climate is doing wonders for the people that come here not feeling well, especially the old. Of course there is no place in the world where the climate is good for everything, but in colonizing a number of people are always found who are not well, and are suffering from stomach trouble and the like. You remember my father and brother-in-law were troubled that way, but now they are getting along fine.

Noys Graves, you know, is from Elgin, too, and he has bought ten acres, too, right beside my ten acres on the west. He is delighted with the country, indeed. He is running a barber shop in Macdoel, and is doing nicely. Myrtle, Ruth and the baby are all fine. We all extend a hearty invitation for you to come out here and see us.

Mr. Campbell was telling me that some Elgin people were coming in the spring. Now if they do not have their car of goods too full, I would like to have them bring my piano. We have come to stay. Thanking you again for your kindness, I remain

Your friend,  
Bert Lombard.

## Ropp's New Commercial Calculator and Short Cut Arithmetic

The Standard for Store, Farm, Bank or Factory,

5 1/4 x 2 1/4 in.

Is from beginning to end a greatly improved, enlarged and thoroughly revised publication.

It contains an entirely new system of unique Tables, Short-Cuts and up-to-date Methods.

It is unquestionably the most complete, useful and comprehensive Calculator ever published.

It has more than twice the matter, scope and capacity of Ropp's former editions, of which

**Nearly 1,500,000 Copies have been Sold.**

It is the most convenient and practical Labor-saving work ever used in the business world.

It will make every one independent, sure and self-reliant in all practical calculations.

It will prevent mistakes, relieve the mind, save time and labor, and often loss and trouble.

Its Tables are adapted to all the trades and occupations in the city and country, and

### Show the Answer as Quickly as a Watch Shows the Time.

It also explains and simplifies the principles of Arithmetic, Mechanics and Mensuration.

It will make the study and use of Figures easy and interesting for young and old.

It will enable every progressive mind to become an expert, sure and rapid calculator.

It will prove a boon to all whose education in arithmetic has been limited or neglected.

**48 Cuts Illustrate the Elements of Mechanics and Mensuration**

It defines about 70 points in "Commercial Law" which every man and woman should know.

It is the result of devising, and improving system after system; of spending thousands of dollars in experimenting; of making millions of miscellaneous calculations, and of doing some vigorous thinking during 38 years, by an analytic, practical and persevering mind.

### It is Especially Designed for

Farmers, Mechanics, Business and Professional men,

The  
Greatest Book  
out for  
Christian Workers

### Synopsis of Contents.

Importance of Personal Work. Personal Experience and Equipment, in the Holy Spirit, the Word of God, Prayer and Faith. Personal Conduct in dealing with Souls. How to approach persons. How to get cases.

The Fundamentals of Salvation Texts for Christians under all conditions of Sin. The Natural and the New Heart. The way of Life and the Way of Death. Hell.

Answers to nearly every question asked by Sceptics, and all classes of unconverted. False Hopes Swept Away. Guidance for those seeking to find Christ.

The Holy Spirit, Acts to 1 John. The Divine Nature of Christ. The Human Nature of Christ. A Personal Devil. Bible readings on Prayer and Thanksgiving.

### Price, by Mail, Prepaid.

Red Cloth, Embossed and Stamped in Black, .....25 cents.

Red Morocco, Embossed and Stamped in Gold, .....35 cents.

Address,

**BRETHREN PUB. HOUSE,**  
Elgin, Illinois.

### Souvenir Cards of

### "The Old Dunkard Church"

at Germantown, (Philadelphia) Pa.

Single copy, 5 cents; three copies, 10 cents; per dozen, 35 cents. Address

**B. F. Kittinger**  
4114 N. Reese St., Philadelphia, Pa.

## CRADLE ROLL SUPPLIES

There is a demand for Cradle Roll Supplies coming from some of our wide-awake Sunday schools, and we are now ready to meet the demand.

**Every Superintendent and Teacher** ought to be enough interested in this new department to ask for particulars. Drop us a postal asking for our illustrated descriptive circular of these supplies. **DO IT NOW.**

Address,  
**BRETHREN PUBLISHING HOUSE,**  
Elgin, Ill.

# RAISIN CITY COLONY

## Procrastination is the Thief of Time

Don't wait a year and then pay \$100 per acre for land that you can buy now at \$40.

Buy you a home in our "RAISIN CITY COLONY" and live happy in the land of SUNSHINE and FLOWERS.

Postoffice is established with A. W. Vaniman Postmaster. The Hotel is now completed and doing a prosperous business. Raisin City Lumber Company has a large stock of Lumber and is doing a flourishing business.

RAISIN CITY is located on the Southern Pacific Railroad, 14 miles from Fresno, a city of 25,000.

### DAIRYING AND STOCK RAISING.

This land is especially adapted to dairying and stock raising as it is the home of the alfalfa.

### RAISINS, PEACHES AND FIGS.

Fresno County, in which RAISIN CITY is located is the greatest fruit producing county in the world, 80,000 acres in grapes.

### SOIL AND WATER.

The soil is a rich, sandy loam; the land is generally level and ready for the plow; and abundance of good water.

### PRICES AND TERMS.

We are selling the land at from \$25 to \$50 per acre on 4 years time at 6 per cent.

For descriptive folders and full information address

## CLINE-WALL REALTY COMPANY

210 Mercantile Place

LOS ANGELES, CALIFORNIA

### THE NEW HOLLY SERIES.

This beautiful series of dainty gift books consists of poems which are recognized as classics. The poems are illustrated by engravings from the best American Artists. The binding is especially prepared for Christmas sale, with Holly design. Each book neatly packed in an

ornamental box. Profusely illustrated. Size, 7½x8 inches.

Our price, .....\$ .35  
Postage, Extra, ..... .08

The bells, .....By Edgar Allan Poe  
Bingen on the Rhine, .....By Caroline E. Norton  
The Cotters Saturday Night, ....By Robert Burns  
The Deserted Village, .....By Oliver Goldsmith  
Gems from Tennyson, As selected from the Author  
Greenland's Icy Mountains, ....By Reginald Heber  
Lady Claire, .....By Alfred Tennyson

**BRETHREN PUBLISHING HOUSE**  
Elgin, Illinois

### EMPIRE SERIES.

Illustrated. 12mo Mottled Leather.

The Empire Series surpasses anything issued in the book line this year. Printed from new plates on the highest grade of book paper with frontispiece and illuminated cover in two colors. It makes a handsome appearance. Bound in genuine mottled leather, gold edges, gold side and back titles, gold ornamental back stamp and gold figures on front cover. Fancy colored silk head bands.

Publisher's price, each, .....\$ 1.50  
Our price, ..... 1.00  
Postage, Extra, ..... .15

1. Black Beauty, .....Anna Sewall
2. Courtship of Miles Standish, H. W. Longfellow
3. Evangeline, .....H. W. Longfellow
4. Hiawatha, .....H. W. Longfellow
5. Imitation of Christ, .....Thomas a Kempis
6. Lucile, .....Owen Meredith
7. Pilgrim's Progress, .....John Bunyan
8. Prince of the House of David, J. H. Ingraham
9. Tales from Shakespeare, Chas. and Mary Lamb
10. Uncle Tom's Cabin, ....Harriet Beecher Stowe

**BRETHREN PUBLISHING HOUSE**  
Elgin, Illinois

# Possibilities of IDAHO

## Unlimited

Many settlers are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for young and old of small means to get good comfortable homes with a splendid income.

### Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

## Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

## Realize \$1,000.00 Per Acre

### Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

### Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

## HOMESEEKERS' ROUND TRIP TICKETS

Will be in effect in the Spring of 1908

Colonists' one-way rates in effect from March 1, to April 30, 1908

Write for information.

February 18, 1908.

No. 7.

## Recent Wonders of Electricity

MANY of the marvels of electricity have been discovered, but each succeeding year brings out newer and greater secrets.

The accompanying illustrations reveal, at once, one of the future fields in which electricity is destined to be helpful to man's ever-increasing needs. We herewith give the likenesses of King Edward and King Leopold taken from an ordinary photograph. The cut of the machine which produces these pictures illustrates the taking of the picture of the President of France at a distance of 636 miles. Ordinary handwriting, printed matter, photographs, carbon prints, or half-tone pictures can be transmitted over the wires and be reproduced on any soft substance at the other end of the line, by the point of a needle which registers a faithful likeness on wax, paper, lead or tinfoil.

This invention will be utilized largely by newspapers in securing fitting illustrations of foreign events the same day they occur. Railroads will also receive and transmit messages, not in the intelligible style of a busy operator, but in a faithful reprint of the original written order. This will remove many accidents and misunderstandings since the best operators often fail to catch or transmit the correct word, thus causing trouble. Preparations are being made for transatlantic operation with the Carbonelle system of tele-

photo service.

The second electrical device of recent date is wireless telephony. One generation ago the telephone was the latest wonder. Five years ago X-rays and wireless telegraphy were in the air, and now in quick succession comes wireless telephony. The government has

already experimented with the new invention until its practical use was settled by installing its service on the fleet now enroute to the Pacific.

Quietly and unknown to the general public, the navy department has begun installing wireless telephones on the warships of this government, not to

supersede, but to supplement, the wireless telegraph.

Lee de Forest, the man who invented one of the systems of wireless telegraph, and who also invented the wireless telephone, was with the north Atlantic battleship fleet in Cape Cod bay for two weeks while the ships were having target practice, overseeing the installation of the telephones on the Connecticut and Virginia, and the system worked perfectly, communications be-

King Leopold.

ing heard at a distance of 22 miles, altho his contract with the government calls only for intelligible communication over a distance of five miles. Mr. de Forest calls his invention the radio-telephone, and a company has been organized to control the business under the name of Radio-Telephone company, of which James Dunlop Smith of New York is president.

Mr. de Forest says the system on which the telephones are operated is substantially the same as that of the wireless telegraph, the voice being carried through the air on electrical waves generated by a dynamo, and sent out into the ether by the powerful current.

On the Connecticut, the newest battleship to go into commission, and on the Virginia, also one of the newer ships of the line, the telephones are set up in the captain's emergency cabin on the bridge of the ship so that they will be handy for the captain or the navigating officer to use, their principal utility being intended to be, at the present, at least, for quicker and more certain communication between ships within from 5 to 20 miles of each other than would be assured by the wireless telegraph.

On the Connecticut there was a music machine, and Mr. de Forest placing the machine in front of his telephone transmitter played a number of selections and on the conclusion of each piece the wireless telegraph operators on the two other ships 11 miles away promptly telegraphed to the Connecticut the names of the pieces played. In one of the tests of the wireless telephone the operator on a battleship 22 miles distant from the Connecticut picked up on his re-

ceivers the words that were being spoken in the transmitter and by wireless telegraph told the officers aboard the Connecticut what had been done.

Mr. de Forest says that in wireless telephony the voice goes out from the transmitter in electrical waves, just as messages go out from the wireless telegraph instruments, but instead of breaking the voices up into dots and dashes by the Morse code as in telegraphy, he modulates the intensity of the electrical waves so that the receiving apparatus will be affected exactly in proportion to the strength of these waves.

In some experiments conducted at Toledo, O., a short time ago Mr. de Forest demonstrated the fact that by his system, one can talk over a regular telephone wire and by wireless at the same time. In Toledo he affixed a wireless transmitter to a regular telephone line and established a connection with a wire telephone. A young woman spoke softly into the wireless transmitter attached to the regular telephone line and the person on the other end received her message distinct while at the same time another person got the same message through the wireless receiver.

King Edward.

Experiments have already been undertaken which have demonstrated the feasibility of communicating between moving trains and central offices and signal stations, and even establishing direct communication with public lines. In fact the readiness with which farmers' telephone lines—often using fence wires—have been constructed in the West leads to the belief that a suitable wireless telephone system would find widespread appreciation in rural communities and mountainous districts.

The great and almost universal appreciation of music reproduced by the graphophone, or other devices, suggests that wireless telephony may have a field in the distribution of music from a central station to the surrounding country. By installing a wireless telephone station on the roof the music of singers and orchestra would be supplied to all subscribers who had aerial wires on or near their homes. The transmis-

(Concluded on Page 148.)

# Problems of Modern Education--How They May Be Solved by Following Practical Lines

Richard Seidel

IF, as is so often claimed, the family life of the home is the foundation of the state, and its integrity is the hope of the republic, then it behooves the state to exert itself to promote and to maintain that integrity to the utmost. It should put forth every endeavor to bring the home to the highest possible degree of comfort and enjoyment, and to moral and physical welfare and security. To this end it can do no better than to see to it that the homemaker,—the wife and mother,—be brought to the proper efficiency for this task. The training of the girl in all of those things that pertain to the welfare of the household should not be left entirely to the mother, who may herself be very inefficient in these duties. Thus poor cooking, slovenly housekeeping, with meager home comforts and attractions, are perpetuated from generation to generation, breeding discontent, dyspepsia and other diseases, driving the husband and father to the saloon, and the boy to the street or from the farm, to which, if he is to be kept, the place must be made enjoyable; and he must be shown that there is a science as well as profit in agriculture, that will engage and satisfy his active and expanding mind, inspiring him with a laudable ambition to make two blades of grass grow where but one grew before.

These ideas might readily be engrafted into the graded schools of the cities and larger towns, but in the sparsely settled country districts their adoption may not be so practical, without the adoption also of the scheme of quadrupling the districts, as is being tried very satisfactorily in some of the states. This plan is to join four common school districts into one, erecting a building in the center, and employing teams to carry the more distant scholars to and from school. This gives an opportunity for graded schools in the rural districts, without adding materially to the aggregate cost. To such schools a kitchen and dining room, a workshop and a piece of land might be added for the teaching and practical application of the knowledge most useful to the common people. In the poor tenement districts in some of the cities, it is found to be advantageous to provide the half-starved children with one good meal a day at the public school, not only as an incentive to regular attendance, but also as a help to their emaciated bodies, enabling them the better to sustain the strain of duty. Instead of making this a charity to the few, the practice might well be extended to universal adoption, making a merit of the custom not only to provide

that no pupil goes hungry, but also to teach the art of cooking and serving meals, and to incidentally afford an opportunity of acquiring commendable table manners, an accomplishment that too few children are taught in their homes.

Instead of carrying the dinner in pails to be eaten cold with the manners usually of young savages, let material be supplied and the noon-day meal be prepared and served by the girls under the direction of a competent cook, and eaten as it would be in a well-ordered home. The land could be utilized for the experimental growth of vegetables, trees, flowers, and fruits. The purpose being to impart some practical knowledge and to implant a taste for this basic industry, which, if once started, will induce those who choose in after life to follow farming, to seek and to develop the most approved methods in such occupation. Not only this, but the universal knowledge of the growth and cultivation of plants will tend to induce every one who can, no matter what his occupation or profession, to have a garden or to ornament the homes with flowers. Incidentally, this work of the school could be made to serve to some extent as a kitchen garden, supplying vegetables and fruits, perhaps for the school table.

In the workshop boys could be taught the use and care of the common wood-working tools, taught the uses of the square, and how to lay off and construct buildings, and to make many kinds of home conveniences. Not merely as make-believes, but the actual construction of useful things to be disposed of, if possible, and the proceeds devoted to the benefit of the school. The most stimulating incentive of the boy or girl to study or work is, the *immediate application of the knowledge and labor to the doing and making of things that are of use*,—that are really desirable and have a marketable value. The girls should be taught to cut and make plain clothing, and to perform many other useful duties of the household.

After the knowledge of the basic duties that are common to all homes, whether rural or urban, are in a measure acquired, the peculiar bent and inclination of each mental unit might be taken into consideration, and their attention drawn toward those specific duties of life to which each seems best adapted or inclined. In this way years of the student's time which is now practically wasted in the study of many things that prove in maturity to be of little, if any value to them, may be saved.

The school, so far as possible, should be made into a model home, in which the parental attitude of the state should be represented in the personnel of the teachers, to whom the mental, moral, physical, and future welfare of the children should have assistance, but a more practical solicitude than is usually manifested by the parents themselves. This deficiency should be supplemented as far as can be by the state seeing to it that each and all, whether high or low, are given such training in the essential and common needs of man as will bring the average conditions of the homes to a more uniform status of comfort and contentment, each generation being an improvement upon the preceding one.

But, growls the taxpayer, this will cost money. Yes, but it will bring ample returns in the improved conditions of the great mass of common people. We pay out millions of dollars to produce, perpetuate, and disseminate the best possible strains of domestic animals, and think the money well invested. How much more will it profit us to develop the highest possible efficiency in the manhood and the womanhood of the nation! Then, too, it will not cost us nearly so much in the aggregate as it now costs us to do without these acquirements and suffer the consequences.

#### ARE TEACHERS OVERPAID?

N. R. BAKER.

THE teacher, when choosing his life work, certainly does not ask himself the question, "Does it pay," because the salary of the teacher in the past in comparison with the remuneration of other professions, has been entirely incommensurate. The attorney or physician who cannot earn two thousand dollars per year is not considered very successful, while five to ten thousand dollar earnings are quite common. In large cities there are pastors of local churches who receive better salaries than the superintendent of education for the entire city.

According to a recent report by a state superintendent of education, the average salary of the teachers thereof was \$40 per month, and the average length of term was six months. Therefore the teacher's yearly stipend, on which he is expected to feed, clothe, and shelter himself, purchase books, attend institutes, etc., or possibly support a family, is \$240. It amounts to \$20 per month, about one-third the wage of a stenographer, half the wage of a grocery clerk, and less than the salary of a common cook when board, laundry, car fare, etc., are taken into consideration.

But you say there are some who get more pay—principals who get \$100 per month for nine months, lucky ones, getting rich at public expense.

Let us see! The salary, \$900 per year, is \$75 per month. This is the usual pay of a mechanic, who, by working overtime, can earn \$100 per month, or \$1200 per year. The teacher who receives \$900 has,

no doubt, spent four years in college at an expense of from \$1000 to \$3000. He has then begun in a lower position and worked up, while the machinist even earned from 75 cents to \$2 per day during his apprenticeship.

I stayed over night with a prosperous farmer. We were discussing salaries. He thought a certain able teacher who was drawing \$800 per year was well paid. He remarked that if he could make that much each year he could lay up money for old age. We then computed the amount of corn and other grain grown on his farm, the vegetables sold or consumed by the family, the profits on live stock, timber, etc., until we easily found a total income of \$2250 per year.

"But" said he "you should not count the garden vegetables and other things consumed by the family."

I replied that no doubt the teacher would be glad to be in a position not to count the vegetables and things of a like nature consumed by his family. The teacher, remember, has no hogs to kill, no wheat to grind, no potatoes to consume, but everything he eats, everything he wears, and even a carriage ride lessens the \$800 until at the end of the year his salary pile has melted entirely away.

I am glad to report that this estimable farmer is now an advocate of higher wages for the teacher.

#### RECENT WONDERS OF ELECTRICITY.

(Continued from Page 146.)

sion stations for such music would be tuned for an entirely different wave length from that used for any form of wave telegraph or telephone transmission, and it is believed that by using four different forms of waves as many classes of music could be sent out as were desired by the different subscribers.

Since Mr. de Forest made the assertion that he would soon be able to talk one hundred miles, conversation has been carried on over two hundred miles apart and time seems to bid fair for transatlantic telephony service.

Only a few years ago the X-rays of electricity were the wonder of the world, but they have now become a commodity in all the civilized world. Next came the wireless telegraphy which is now in daily use across the Atlantic Ocean, and as these lines are being read electricians are perfecting a machine by which persons talking over a telephone, can have the facial expression of each other reproduced before them constantly while talking, so that it would seem like being in each other's immediate presence.

What relation electricity sustains to life itself no one can yet tell, but some even go so far as to assert that electricity is not a product, but life itself, which, if properly connected with the body would give immortal life.

## How Our Language Has Grown

### An English Hymn of One Thousand Years Ago.

Nú we secolon herian,  
 heofon-ríces weard,  
 metodes mihte,  
 ond his mód-geponc,  
 weorce wildor-faeder,  
 swá hé wundra gehwæs  
 íce dryhten  
 órd onstealde.  
 Hé ærest gesceop  
 eorðan bearnum  
 heafon to hrófe.  
 hálíg scippend:  
 pá middangeard  
 moncynnes weard  
 íce dryhten  
 æfter téode,  
 firum folden,  
 fréa ælmihtig.

The above is King Alfred's translation of Caedman's hymn. It shows the Anglo-Saxon language of the eighth century out of which modern English has grown. We also give the translation into modern English. Poetry then did not depend so much on meter and rhyme. The euphony of words and symphony of rhythm in poetry was found in two or more words of a sentence beginning with the same initial sound or *letter*. Note the two initial m's in the third line; the two w's in fifth line and so on.

Now must we glorify  
 the guardian of heaven's kingdom,  
 the maker's might,  
 and his mind's thought,  
 the work of the worshiped father  
 when of his wonders, each one,  
 the ever-living lord  
 ordered the origin.  
 He erst created  
 for earth's children  
 heaven as a high roof,  
 the holy Creator;  
 then this mid-world  
 did man's great guardian  
 the ever-living Lord  
 afterward prepare,  
 for men a mansion  
 the master Almighty.

When this hymn was composed capital letters were not used to begin each line of poetry.

Here is another poem written four hundred years later:

Nu, brotherr Wallterr, brotherr min  
 afterr the flaeshess kinde;  
 annd brotherr min i Crisstenndom  
 thurrr fulluht annd thurrr trowwthe;  
 annd brotherr min i Godess hus,  
 yet o the thríde wise,  
 thurrr thatt witt hapenn takenn ba  
 an renhellboc to followhenn,  
 unnderr kanumkess had annd lif

swa summ Sannt Awwstin sette;  
 ice hafe don swa summ thu badd.  
 and forthedd te thin wille,  
 ice hafe wennd untill Ennglissh  
 Goddespelless hallyhe lare,  
 afterr thatt little witt tatt me  
 min Driggtin hafeth lenedd.

### Translation.

Now, brother Walter, brother mine after the  
 flesh's kindred; and brother mine in  
 Christendom thru baptism and thru truth;  
 and brother mine in God's house, yet on the  
 third wise, seeing that we-two have taken  
 both one rule-book to follow, under a canonic's  
 hood and life, so as Saint Austin set; I  
 have done so as thou badest, and furthered thee  
 thy will, I have turned into English the  
 Gospel's holy lore, after a little wit that  
 to me my Lord hath lent.

Here is Tyndale's English less than four hundred years ago:

When Jesus was come downe from the mountayne,  
 moch people folowed him. And lo, ther cam a lepre and  
 worsheped him saynge: Master, if thou wylt thou canst  
 make me clene. He putt forthe his hond and touched  
 him, saynge: I wyll, be clene, and immediately his leprosie was cleses.—From Matt. 8.

Here is some English spelling in the twentieth century as found in all books published in England: Colour, honour, favour, vigour, vapour, civilise, realise, utilise, axe, almanack.

### WHICH IS RIGHT AND WHEN?

CALENDER or calendar?

Mamma or mama?

Defense or defence?

Affected or effected?

Should the words "alma mater" be capitalized?

How does the suffix "ible" or "able" affect the meaning of the word to which it is attached: salable, teachable, intelligible.

London is one of the healthiest large cities in the whole world. Its death rate, 15.1 per thousand, is lower than that of all but two of fourteen English cities with more than 200,000 inhabitants. The difference in the death rate of different boroughs of the city, however, shows how low the rate might be if a comfortable living was provided for everybody. In Hempstead, a well-to-do district, the rate was only 9.4 per thousand; in Finsbury, it was 20.7. As for children, in Hempstead 77 per thousand of children born, died under one year of age, while in Shoreditch the rate was 16.3. The birth rate in London has dropped from 35.4 per thousand in the decade ending in 1870, to 26.5 last year.

WHEN God's work comes to a standstill, you can depend upon it that obstacles are in the way that human hands can remove.

### NEED OF BANKING REFORM.

The simple trouble is that no one bank can stand alone in a time of fright when its depositors have precipitated a run upon it; and our system provides no way by which the strength of the banking system at large can adequately support the isolated bank in its moment of need. In times of financial stress and stringency in other countries, relief is afforded by a banking system whose motto is: Always pay out money just as fast as possible, taking good security for it, and if necessary raising the interest rate. But in these other countries the banking system has some form of central support to rely upon. Many experienced people in this country are now advocating the establishment of one or more great central banks of issue, which shall represent in principle, whatever be the legal relationship, the power and strength of banking coöperation. If we had any perfect remedy to offer to Congress or to the banking community, it would not be withheld. All that we can say is that our present system, which is in many respects admirable, needs some further development in order to give it greater strength in times of sudden and severe storm. So far as the safety of our currency goes, nobody could wish anything better. The proposals for giving greater elasticity to the outstanding volume of currency are well enough in their way. But they do not quite reach the real difficulty. It is not so much that we need more currency when the corps are moving and business makes an unusual demand, as that we need a better protection for the banks, so that they may not feel that they must sacrifice both their depositors and their approved borrowers for the sake of maintaining their own solvency.

#### Central Bank's Advantages.

Emergency currency based solely on a high interest rate is undesirable, and, at best, a palliative. What we want is an insurance of properly protected bank-credit notes to insure elasticity; rediscounting facilities; control of the discount rate; and the prevention of soaring interest rates. These, and more, a central bank will furnish. Such an institution would deal exclusively with banks, receive and disburse Government moneys, act as Government agents in reducing paper money, issue currency, and rediscount for banks. It would serve as a buttress for the national banks and as a sanctuary in times of panic. It would prevent the hoarding of Government money in the Treasury vaults by acting as its custodian, and it would terminate the periodic appeals of the money market to the Treasury for relief. By dividing its stock among the national banks of the country in proportion to their capital its relation to each would be uniform, and through the constant changing of its paper its assets would be available always and its assistance to business constant. Moreover, it would eliminate the Sub-Treasury system, and prevent inflation and contraction, liable to follow the Government's disbursements and collections, by keeping the nation's money at the disposal of trade and commerce. Every country in Europe has a central bank, and the Bank of England, Bank of France, and Imperial Bank of Germany, or Reichsbank, are pertinent illustrations of worth and service. Japan copied our system thirty-five years ago, but later discarded it for the central bank. We alone among highly civilized people have no such institution, and to profound political prejudice, that is absolutely without foundation, must responsibility therefore be ascribed. It is a melancholy commentary on our character and an ad-

mission of our inefficiency, that we are unable to adopt for our financial ends a method so helpful to other countries.

#### Results of a Currency Poll.

Within one month, the writer personally conducted a currency poll of the presidents and cashiers of leading banks throughout the country, for a leading financial newspaper. New York City was not included. A ballot was prepared containing an outline of the plans aforementioned and mailed to several hundred bankers, with the request that they indicate their preference, assign their reasons and return to sender. The results were most surprising and unexpected. Replies were received from almost 400 voters in thirty-three States. The Central Bank of Issue led the poll, receiving 33 per cent of all the votes cast, and the plan of the American Bankers was second, having been favored by 29 per cent of those balloting. The Shaw, Treat, Chamber of Commerce, and Fowler plans followed in the order named, and, combined, did not equal the vote of either of the dominant recommendations. In addition, it is worthy of mention that fourteen voters rejected all plans and sixteen submitted original solutions for this perplexing issue.—Review of Reviews.

#### A THOUGHT ON MODERN WIT.

ARE we losing our appreciation of genuine humor and placing a premium upon the comic supplement stuff that cannot possibly appeal to the risibilities of any refined mind? It almost seemed to me that we are. A few nights ago when I stepped into the book department of one of Washington's department stores, I wanted to laugh a good hearty laugh and decided on Dickens's "Pickwick Papers" as the medium through which to secure it. A copy was secured, an excellently printed and bound copy for only forty-five cents, and I congratulated myself on securing such a treat for the price. While waiting for the change and the book to be wrapped, I looked over some of the other volumes about me and found a number of people purchasing an illustrated edition of the adventures of some "Teddy Bears." Taking up one of the books I found it marked at \$1.10 and on examining it found that it was filled with the merest drivel; its attempts at humor were positively pitiful; yet people were buying it, paying more than twice as much as I had paid for my 400 pages of Dickens. Of course a variety of tastes must make up the world, but with the great works of such men as Dickens at such low prices, why will men squander their money on the weakling attempts of some of the addle-pated "up-to-date" writers. Read Dickens and you will enjoy his humor, you will never forget his characters, nor will you tire of returning to his pages from time to time. But who ever reads the same comic supplement twice? Without arrogating any particularly good judgment to myself, I could not help thinking as I tucked my treasure under my arm and left the store, "Blessed is the man who can choose a good book."—*Pathfinder*.

## MORE THOUGHTS AND FACTS ON INTERNAL IMPROVEMENTS.

Internal improvements on a national scale is the theme of the day, both in and out of Congress. Indiana has organized a River and Harbor Congress to act as a branch and feeder to the National River and Harbor Congress. This move will be duplicated in every direction and just as the Inglenook prophesied last September, we may expect the next generation to revolutionize inland transportation facilities in the United States.

Peace advocates ought to lend their influence to this commendable turn in national affairs. To drain 75,000,000 acres of swamp lands; to fertilize and reoccupy 100,000 vacated farms in New England; to irrigate 300,000,000 acres of arid land; to reforest 100,000,000 acres of mountain; to conserve waterfalls, mountain freshets, and snow water, so as to prolong the navigable period of our rivers; to increase our canal traffic so as to hasten freight and reduce its cost; to build cement or rail highways so farmers can save time, labor and expense in marketing their crops; to attend to sanitary conditions in cities, schools and homes; to build and equip industrial schools and teach domestic science to our daughters;—these are things that will make a prosperous, happy, contented and a united people. Had the military appropriations of the past been spent in such improvements as we have named above the world would be none the worse off and the American people would be one hundred years in advance of any nation on earth.

The **Inglenook** stands for loyalty and patriotism in all national movements that count for the good of the people. Let everybody talk up internal improvements and thus divert the public mind from so much military display and expense. Remember that forty per cent of our national expenditures of late years has been on the army, and navy, and pensions and the rate is rapidly increasing.

Germany and France have a Cabinet officer of public works, with good results, while at present our water ways are under the War Department.

As an example of what a little improvement in water traffic will do we refer to the Great Lakes, where \$70,000,000 has been spent in improved harbors, outlets, etc., and the traffic on the lakes has doubled and trebled repeatedly within the past twenty-five years. These lakes now have the largest inland marine commerce in the world, and rapidly increasing each year.

Some people have the false notion that canal freight is slower than steam cars in transporting freight. The average distance of freight cars per twenty-four hours is twenty-five miles, while the lake steamers average two hundred miles a day. The heaviest freight trains carry only 2,000 tons, while one river barge will carry as high as 72,000 tons. The Ohio River equals ten double-track railroads, so far as transportation capacity goes. Around the Great Lakes, railroad freight is 8.7 mills per mile a ton, while the steamer rate is only one mill.

From these facts it is easy to see the imperative need of improving our inland conditions. Railroads are now robbing the people in freight rates, and millions of dollars worth of crops spoil in the South every year for lack of ample freight service.

## RELIGION IN THE PUBLIC SCHOOLS.

We expect to see a marked increase in the demand that the public schools give more attention to ethical instruction in the near future. The distinctive ideas of religion, such as immortality, the personality of God, salvation through Jesus, the inspiration of the Bible, will not be taught; but justice, sympathy and brotherly love toward all men, the duty of abiding by the law, the evil of intemperance, gambling, and vicious indulgence will be taught. For these have nothing to do with any particular creed, but have to do with the stability and future success of the State. In this connection a portion of the speech of Ambassador Reid before the school-teachers, of New York, on the English system of education is worth quoting. Referring to the general sentiment in America concerning the present contest in England over the teaching of religion in schools supported by the state, Mr. Reid says: "And yet I cannot help feeling that on the general subject we might profitably take a hint from the old country. Whatever else we may say about the English schools they do turn out well-behaved, orderly boys and girls, respectful to those set over them, grounded in the morals of Christian civilization, with instinctive sense of obedience to law and becoming regard for the authorities that represent it. Would we be any worse off if we had more of these qualities here? May it not happen that in our efforts to keep all questions of religion and morals in what we consider their proper place, they may in reality be left without any place in the training of a good many children? If the interest of the Republic requires that every child should be compelled to learn to read its laws, does not the same interest as imperatively require that every child should be taught, and should be unable to escape being taught the absolute necessity of respect for those laws, and of prompt and dutiful obedience to the officers of the law? Does not the interest of the Republic further demand that the coming citizens shall have some idea of our old beliefs in the fatherhood of God and the brotherhood of man, or at least shall be thoroughly grounded in the great principles of the moral law, without which neither ordered liberty nor civilization itself can exist?"

"If English schools, according to our ideas, go too far, in teaching creeds, may we not be going too far the other way, in some parts of the country at least, in excluding altogether, or in giving too little space to teaching unsectarian religion and morals, to enforcing respect for authority, and to training the habit of mind that secures unhesitating obedience to law, and to its officers? In London the policeman, the representative of law, often controls the biggest and angriest crowd by lifting his hand, in cases where the New York policeman has to lift his club. Nay, here the giddy chaffeur, for a single example out of many, gayly snaps his fingers at the up-lifted club, and has to be run down on a motor cycle. Even then, when caught, he is apt to tell the presumptuous policeman he means to have him "broken" for his pains. Such a threat in London would railroad him to a long term in jail. The mere failure to stop, the moment a policeman lifts his hand, is generally in England unthinkable; the imagination is staggered to conceive the punishment that might befall the insensate and foolhardy person who should venture on such unprecedented lawlessness. Some cause has produced this difference. Is it improbable that early training in a school that could be nowise escaped by the growing boy had something to do with it?"

### WORKING OF THE RATE LAW.

The Interstate Commerce Commission in its twenty-first annual report just issued expresses its satisfaction with the working of the rate law in commerce. Although the law has been in force only sixteen months, the Commission reports:

"To a gratifying extent there has been readjustment of rates and correction of abuses by the carriers themselves. Methods and usages of one sort and another, which operated to individual advantage have been voluntarily changed, and it is not too much to say that there is now a freedom from forbidden discriminations which is actual and general to a degree never before approached. . . . The amended law, with its enforceable remedies, the wider recognition of its fundamental justice, the quickened sense of public obligation on the part of railway managers, the clever perception by shipping of all classes that any individual advantage is morally as well as legally indefensible, and the augmented influence of the Commission resulting from its increased authority have all combined to materially diminish offensive practices of every sort and so signally promote the purpose for which the law was enacted.

"Of the 107 cases which were contested before the Commission, the Commission sustained the complaint in forty-six cases, dismissed it in forty-six cases, and fifteen cases are as yet not decided. The Commission believes that it should be given the power to restrain a railroad from an advance in its rate when it will work injustice to shippers until the propriety of the advance can be proposed upon; and further, it would have the power to postpone the advance until such a time as it will work no unnecessary injury. The Commission is greatly troubled by the inadequacy of the railroads to meet the increasing demands on them that accompany the rapid growth in production in America. It quotes the opinion of one eminent railroad president who estimated that during the period from 1895 to 1905 the traffic offered for carriage in the United States increased 110 per cent, while during the same period the instrumentalities for handling this traffic increased only twenty per cent, and declares "it may conservatively be stated that the inadequacy of transportation facilities is little less than alarming; that its continuation may place an arbitrary limit upon the future productivity of the land, and that the solution of the difficult financial and physical problems involved is worthy the most earnest thought and effort of all who believe in the full development of our country, and the largest opportunity for its people." As a result of the Union Pacific investigation the Commission recommends:

"Railroads should not be permitted to invest generally in the stocks, bonds, and securities of other railway and steamship companies, except connecting lines, for the purpose of forming through routes of transportation, including branches and feeders. It is in the interest of the public to facilitate the consolidation of connecting lines. The credit of a railway company is founded upon the resources and prosperity of the country thru which it runs. Its surplus funds and credit should be used for the betterment of its lines and in extensions and branches to develop the country contiguous to it."

Testimony taken at the hearing showed that about 50,000 square miles of territory in the State of Oregon, surrounded by the lines of the Oregon Short Line Railroad Company, the Oregon Railroad & Navigation Company, and the Southern Pacific Company, is not developed; while the funds of those companies which could be used for that purpose are being invested in stocks of the New

York Central and other lines having only a remote relation to the territory in which the Union Pacific system is located.

### THE CAMPAIGN FOR REDUCED POSTAGE.

While we talk so much of binding men together in the spirit of brotherhood, we are likely to forget that the binding together comes always through concrete means, such as speech, books, newspapers and letters. Raise telegraph rates and telephone charges and by so much we drive people apart. Lower them, and we bring people nearer together. The English are talking of asking us to establish a two-cent postage rate with them. At present a letter from London, if its destination is New York, pays five cents postage; but if it goes thru New York to Montreal, Canada, it pays only two cents—an unreasonable distinction. Every letter from England to America is one more factor in the insurance fund against possible war. The Postal Progress League has an even more ambitious plan, however, than two-cent postage with Great Britain. They propose to introduce into Congress at the next session a bill for the consolidation of the first, third, and fourth classes of mail matter, with a common rate of one cent for each two ounces or fraction thereof. The domestic letter revenues for the year past were \$160,000,000. As the League views it, the reduction would save the public \$80,000,000 annually. Altho there might be a slight reduction in revenues for a year or two, experience has shown that the postal income would soon be larger than ever. The first notable reduction in the letter rates of this country occurred in 1845, when the previously exorbitant rates were reduced to five cents per half ounce up to 300 miles, and ten cents for greater distances. The effect of this reform on the revenue was a temporary slump, but by 1855 the previous figures were surpassed. In 1851 the rates were again reduced to three cents per half ounce up to 3,000 miles, and six cents for greater distances. Again the revenue showed a temporary slump, but by 1855 the previous figures were again surpassed. During the interval 1883-1885 the letter rates were reduced from three cents per half ounce to two cents per ounce, and the publishers and newsdealer's rates on magazines and newspapers were cut from two to one cent per pound. Again, there was a slight temporary falling off in revenue from \$45,500,000 in 1883, but by 1887 it had reached \$48,800,000, and by 1890, \$60,800,000. In 1890 it was \$102,000,000. The postal deficiency for 1888 was less than for any year during the period from 1867 to 1879. As a result of the 33, 1/3 per cent reduction of the letter rate in 1883, the postal revenues fell off less than 7 per cent in the two succeeding years, and the 100 per cent increase of the letter unit—from a half ounce to an ounce—in 1885 was accompanied by an immediate increase in the revenues, which in 1887 were 7 per cent; in 1890, 33 1/3 per cent, and in 1900, 100 per cent higher than in 1883, the year of the letter rate reduction. There is a considerable profit on local business at present rates, and the League believes that local business would enormously increase with a reduction in the postage rates. Previous to 1891 the pieces of mail matter handled in our free city delivery services were carefully counted, and the cost of the service found to be less than one-quarter of a cent apiece; in the City of St. Louis it was only one and five-tenths mills apiece. The League's statement concludes: "If there was any decrease in the postal revenues, the experience of what followed the notable reduction in the postal rates in the years 1883 and 1885 proves that it would be followed by a quick recovery."

**WHY LABOR HATES CAPITAL.**

No acute analysis nor Platonic logic is needed to answer the above question and with it all the concomitant and correlated questions which bother the rich and poor alike. A few figures of recent events will forever settle the inquiry. Here they are: Dec. 2, 1907, 36 miners lost their lives in the Naomi mine. Dec. 6, 1907, 344 miners perished in the Monongah mines. Dec. 16, 1907, 43 miners died in the Yolande mine, and on Dec. 19, 1907, 228 more perished in the Darr mine. 651 in all, for one month. The total for last year was 7,000.

Carefulness and proper testing appliances would prevent nine-tenths of all our mine disasters, but the wealthy coal owners who live in palaces refuse to spend a little money for the safety of their employes. The employe does not feel friendly over the matter. Neither would you, nor I, or the mine owners if the conditions were reversed.

**BOYCOTTS BY LABOR UNIONS ARE ILLEGAL.**

A far-reaching decision of the Supreme Court of the United States was made last week on the legality of organized boycotts. The boycott method has been one of the most effective weapons of labor unions. Whenever the demands on the union was not met by the employer the employes would quit work. This factory, or whatever it chanced to be, was then reported to the Federated Unions and advertised in all of the literature of the unions as well as an enemy to labor.

The next stop taken by the unions would be to quit buying the wares of that factory, and to quit trading with any and every retail dealer in the United States who handled the wares of that factory. This system has ruined dozens of prosperous enterprises and forced hundreds more to surrender to the labor unions. Business men have dreaded the boycott worse than a fire, because it meant more complete disaster.

The Sherman Anti-trust law which was passed several years ago was meant to restrict any and all measures which tended to restrain the natural channels of trade. Under this law the Supreme Court has found the labor union boycotts to be illegal because they seek to restrain trade outside of their own realm. When they refuse to trade with a store which sells nonunion goods, and persuade others to not trade there, and force that merchant to buy union goods or quit business, and at the same time force the factory to quit a legitimate business because one or more laborers in the factory lost a job, it all seems an unfair method. Railroads and other corporations are fined for restraining trade, or for illegally getting it, therefore the Supreme Court seems to be impartial in its present ruling.

**THE CHINESE INDEMNITY.**

It is a matter of pure honesty, national honesty, nothing else, that the United States should repay to China the surplus of indemnity, which China was compelled to pay us after the Boxer troubles. The nations compelled China to pay the damages done and the cost of the expedition to Peking up to \$336,000,000, of which the share of the United States was \$24,440,778. It is now found, when all the expenses and claims have been paid, that everything has amounted to only \$11,655,902. That is, there is nearly \$13,000,000 that has been paid by China, or which she is under bond to pay, beyond what was really due from her. That ought to be remitted to her, and a bill to that effect

has passed the House and ought speedily to pass the Senate. We have no honest right to that excess. To keep it would be robbery. It would please us to hear that other Governments follow our example, but no news of that sort has yet arrived.

**MORE REGARD FOR IMMIGRANTS.**

A factor in the solution of the immigration problem is our treatment of these people as we find them in our towns and cities. They are receiving impressions of American life and ideas that are likely to be lasting, and it behooves us to see to it that these are such as will be beneficial. We are helping to mold them into the new life of this free country. Are we careful enough of their environments? Good citizenship on our part will do much to solve the problem. But above all else is the need of bringing to them the Gospel in its simplicity and helpfulness; it is still the power of God unto salvation. This is a duty we owe to them for the Master's sake. President Roosevelt has aptly said: "Americanism is not a matter of birth, or ancestry, or education, or creed, it is a matter of the spirit that is in the soul of man." God has placed upon us the duty and given us abundant opportunity to help put the right spirit into the souls of the incoming millions.

**NATIONAL GOOD WILL FOR CUBA.**

Public sentiment in the United States cordially approves the plan for turning Cuba over to the Cubans as soon as possible, but the Cubans themselves, to judge by the Havana papers, are sorry to see the approaching end of the Provincial Government. The two rival leaders of the Liberal party, General Jose Miguel Gomez and Senator Zayas, appear to be almost the only men who welcome the news. The Cubans are cynical in regard to their own ability in self-government. If they could keep an American, for instance, Governor Magoon himself, at their head, and the American army to support him, probably all would go well. As it is, our army will probably stay a few months after the inauguration of the new regime.

**Uncle Sam's Reason for Fining the Standard Oil Company.**

"Johnny, you get paid well enough without stealing."

# THE INGLENOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## OUR DIFFERENT TASTES.

THERE is as much difference in taste for reading matter as there is in taste for selecting eatables. One reader writes his appreciation of one department of the INGLENOK, and some one else sends in his thanks for some other department, so that each class of thinkers finds the bill of fare suited to his needs.

On the other hand we advise the reading of even what is distasteful, providing it varies only in taste, for, in no other way can a person be well rounded and competent to pass judgment on a very wide range of thought. To read one class of literature exclusively, narrows a person even in his own chosen field, for each thought, vocation, and each field of research sustains fundamental relations with all the other departments of both material and spiritual existence.

A certain scholar of repute has recently expressed the above thought and it is being echoed and re-echoed by scholars in every line of work. For your own development we urge a wide range of reading and at the same time special emphasis and attention can be given to your chosen work or hobby if it has crystallized into that form yet.

## WHAT NEXT?

A NEW subject of gossip had just been announced and amplified by my visitor. Two days before this same person had informed us fully on something just about ready to be masticated by the ravenous character eaters of the neighborhood, of whom she was chief.

This same person came about three times a week with just such messages until the above question would voluntarily come to our minds as the door was opened and closed by our informant.

But don't you like to hear other people properly sized up by professional gossipers? And don't you like to see other people wince a little once in a while.

when under the fire of an expert gossip?

It would be a glorious thing if everybody would talk about existing conditions without discussing *persons* so much. It is easy and profitable to keep in touch with, and have a judgment on surrounding interests which can be expressed on proper occasions without discussing persons at all, only as they relate to the interests discussed. It is little business to reduce all conversation to a personal basis and forever hold the object of attack either above or below par—your own imperfect self regulating all estimates. There are too many personal pronouns used in everyday conversation to maintain a brotherhood of feeling. The "he's" and "she's" are to be heard seven days in the week on the streets, before and after religious meetings, at festivals, and in every collective body of people.

Have you ever tried to talk less about *persons* and more about the *principles* involved in the work which the person talked about, represents? Try it for ten years and you will receive a satisfying revelation. Too many people today, are bordering on the line of professional gossipers.

## WE HAVE A RIGHT TO SPEAK.

WHEN a person is right he should be heard. We know we are right about the need of better literature in our homes, and we will add, more sensible sheet music in the parlor. Kutchy-kutchy-koo, lovy-me, lovy-you music, and sensational books and papers, will corrupt and ruin the brightest and purest children that God can give us. Either discard such stuff from your homes or else confess that you are, by choice, in cahoot with the devil. Get squarely on one side or the other.

## HOW ONE WAS WON.

"PLEASE send me a dozen INGLENOKS to distribute among my friends. I think some of them will subscribe for it. That is the way I became a subscriber. Miss Hawkins, from Indiana, sent me a few copies.

Sincerely, ARMELIA L. COLWELL, New York."

Yes, there are dozens of subscribers just like the one above. There could be a hundred more secured.

## POWER PLUS SAND.

A LOCOMOTIVE is a good example of power, yet we saw one of the largest and finest of engines stuck on a level track because it had no *sand*, or rather, because its supply of sand was exhausted. You know that on the top of every locomotive, and electric coaches, is a tank of sand which runs thru a pipe to the track and sprinkles sand on the rails, so that the wheels will not slip when the rails are frosty or the load too heavy.

People need some *sand*, too, as well as does the locomotive, if they expect to accomplish much in this

world. It is not enough to simply have power, in order to do something. That power must be applied, and that at the right spot and in the right way. Most people find their load very heavy, and their track either smeared with the envy of some opponent, or frosted with the indifference of careless helpers, before they get very far in life.

A good supply of gritty sand is not a bad thing to have on such occasions. It keeps the wheels to the track, moves the load and makes gain out of the otherwise unused power. Get some sand! Use it!

#### OUR NATURE COLUMNS.

WE want our readers to become lovers of nature, because nature is both beautiful and good to us. The greatest teacher of all ages was a lover of nature. It is healthful, and inspiring to mingle with nature. We want short, catchy items in this column, something the young should learn and something the old want to know.

#### ANOTHER ORPHAN GIVEN A HOME.

HAD we found only four homes for orphans within a year we would have been elated, and would have been well repaid for our efforts, but the Christmas number alone, of the INGLENOOK, has accomplished that much that we know of, and how much more good it did we may never know. We are not very much in favor of lounging around, floating first this way, then that way, here on the ocean of life. God gave us ever-active minds and supple bodies and he strews our paths with golden opportunities for doing good. Let us take hold on something and fill our mission.

#### HOW SOME THINGS GROW.

A FEW weeks ago we spoke a few words about why some things grow, and said that some things grow from internal energy, and some from external force. We have repeatedly called attention to the need of spreading the influence of the INGLENOOK altho some people think one call is enough and tire when a few more are made. Could our agents and readers become as enthusiastic over a good thing as some other people do over some things not so essentially good, then they would not get tired so quickly and so often.

One political paper of note has organized a club arrangement by which its management is working for 1,000,000 subscribers. Each week, for many months past, that paper has from one to two pages full of matter pertaining to its success. Calls, appeals, plans and testimonials by the score and hundreds are given. And the plan is proving a success. As many as 2 000 subscribers per week are secured. Do you wonder why? Because the whole force are workers, that is all.

If you believe in offsetting evil; in producing good

literature; in inspiring individuals and helping the home, then take a hint from the methods of the paper under consideration and see what you can do.

#### BOILING DOWN AND BOILING OVER.

GENERALLY it is easier to boil over than to boil down in the use of words. We found the following example of verbosity which is too common with many writers.

Not so many years ago is it in the history of the medical profession that we find the scholastic arrogance and quaint conceit of the dignified Doctor Medicine refusing to consider seriously as a legitimate part of his Aesculapian function the prescribing of proper food as an auxiliary remedial measure complementing the more noxious and nauseous agents of his pharmacopoeia.

How much more clearly and lucidly the same thought might have been expressed in the following sentence:

"It is only a few years ago that the doctors entirely ignored the importance of prescribing proper food in the treatment of disease."

Here is another editor's plea for conciseness in manuscript submitted for publication which Orison Swett Marden gives in *Success Magazine*. An amateur journalist once wired a city editor:

"Column story on ———. Shall I send?"

"Send six hundred words."

"Cannot be told in less than twelve hundred."

To this the editor replied: "Look at Genesis, first chapter, story of **creation**, told in six hundred words. Try it."

The president twice returned to Congress, for condensation, the Bristow reports on the postal frauds. It contained 100,000 words, and was involved and intricate. Seventy-eight thousand words were finally cut out, reducing it to a pamphlet of 22,000 words.

Another illustration of how essays can be condensed with profit is as follows which is given by the Mahin Advertising Company.

During the period of convalescence, when it is particularly desirable that the patient's appetite should be encouraged with all manner of easily digestible and readily assimilable nourishment, no variety of foodstuff is better adapted to gratify the palate by its pleasing and delicious properties, and at the same time to supply each and every form of nutriment required to rebuild, to reconstruct, to regenerate, the whole material organism, wasted and enervated by disease than ———.

Reduced to simple and lucid English, this sentence would read as follows:

During the period of convalescence, nothing is so well calculated to please the plate or rebuild the waste organism than ———.

The aim of the writer should be how much thought can be expressed clearly in the fewest words. A flood of words is often an indication of a drought of ideas.

### MEDICAL.

#### Proper Breathing.

DR. B.

PERSONS who have throat or bronchial trouble, and in fact every body else, should be careful to sleep with their mouth closed. The nasal passages are the natural sources through which to breathe. As the air passes thru the nasal channels the particles of dust are checked and the temperature of the air is modified. But when the air is breathed thru the mouth, not only the cold air but also particles of dust are directly admitted into the bronchial tubes which is certain of creating an irritated condition of the mucous membrane of the throat and bronchial tubes or air cells, and in time, a diseased condition results.

When breathing through the nasal channels is difficult the wrong should receive medical attention. Especially is this true in children. When a child breathes with its mouth open there is a wrong that should be remedied at once, as the cause is due to what is known as adenoid growths in the back nasal channels, and they should be removed in order to add to the child's general vitality and future health.

Public speakers and singers should practice deep breathing, admitting the air into the lungs through the nasal passages and with every inspiration practice abdominal expansion as well as expansion of the chest. Not more than twelve to fifteen full breaths should be taken per minute and each inspiration and expiration governed by regular intervals.

Possibly there is no better way of developing lung capacity and health than by sleeping in a well ventilated room with plenty of warm bed clothing and keeping the mouth closed, so as to keep the mucous membrane of the mouth, throat, and bronchial tubes naturally moist.

Where there is an irritated condition of the mucous membrane of the mouth or throat, one half an ounce of listerine, one half ounce of fluid extract of sweet licorice, one fourth ounce glycerine and water to make four ounces makes a very pleasing and effective mouth wash or gargle, or for better effect, place the fluid in an atomizer and spray the parts often.

THE world accepts a man at practically the same estimate he places upon himself, provided his own estimate is honest.

### CLEANLINESS.

BY FLORA E. TEAGUE.

OUR mothers and grandmothers know but little about hardwood floors. Today in the homes of the wealthy they are frequently seen. They are vastly superior to the old style floor carpeted up to the basement board, where dust settled and moths harbored and ruined in delight. Those of us who are not able financially or otherwise to have hardwood floors, can have something else "just as good."

No matter what kind of floor you now have, putty up the cracks. If necessary, plane off irregularities in warped boards, then apply any of the many kinds of "floor shines" now advertised. Sew your carpet together in strips for a large or small rug, whichever you prefer, and place it in the center of your border-stained floor. It needs no tacking. (What a labor saving!) It can be removed daily, weekly, or monthly, shaken, aired, and replaced with but little trouble. The result is freedom from dust and moths; freedom from taking up and putting in tacks, a pretty border for your rug, and greater cleanliness and purity. A dampened cloth, or even a dry one on a light mop-stick applied occasionally freshens the painted border. After a trial of this kind, you will never want to go back to the old style of all-over-carpet floors.

Lordsburg, Cal.

### GETTING AT IT BACKWARDS.

HAVE you noticed that most people start in sin by a backward act? They ask, "What harm is there in this?" instead of asking, "What good will it do me." There may be no inherent harm in the act itself, but *the absence of virtue in an act is within the border line of sin* already. No one has a moral right to think or live such a neutral life that the world can truthfully say that they contribute no moral force to society. A day or year of such neutral conduct is *wasted*, and to waste talent is to degenerate and merit the Lord's disapproval.

If you want to be sure and safe at all times, then seek ways and places that calls out your virtues rather than your lusts. In short do those things which are so helpful that you do not need to ask if there is harm in it. Beware of innocent looking pleasures if out of that pleasure the crying wail of some blighted soul in the past can be heard.

# Sues Saloon-keepers for Damage to Home

THE daily press of Chicago gave the following account on January 11, 1908:

The plaintiff's case for Mrs. Jennie De Haven, the little woman suing four saloon-keepers whom she charges with the wrecking of her home and the destitute condition of her little family of seven children, was finished in Judge Eberhardt's court at noon today.

Mrs. De Haven said on the stand:

"My child Raphael was without medicine during a severe attack of pneumonia; he has often been without food and proper clothing, and I have been obliged many a time to get stale bread from bakeries to feed him."

"While my husband, Henry, was drinking hard in these saloons, my seven children and I had to live by the help of neighbors.

"Little dresses and shoes were brought to us by friends, and the churches helped us now and then. All this was because my husband could not get away from the curse of the drink these defendants sold him.

"They got his wages; we lived in rags. Sometimes we could not go out doors because we did not have enough clothes. Sometimes we were so hungry that we were desperate.

"Neighbors gave us food. Sometimes they gave us a little money, and out of it I had to pay the car fare that sent Henry to work to earn money to pay for his drinks.

"At night the children went to the bakery with baskets. For hours they would stand in line to get their share of bread that was old. Often that was all we had to eat."

Mrs. De Haven, who is seeking \$1,000 from the saloon-keepers, is said by her neighbors to be a model little mother and a loving, suffering and patient wife.

Of the seven children for whom the mother has been bravely fighting the wolf from the door, there is the baby Homer, nine months old, Raphael, a delicate little chap, four years old; Leverina, six; Doris ten; Ralph, thirteen; Lillian, fifteen; Harry, seventeen, the only one of the children that works and is able to assist with the support of the others.

Mr. De Haven, who has taken a liquor cure, and is

now at work, said today with tears of humiliation in his eyes:

"I did not want my wife to bring these suits. I did not know they were entered until I read an account of them in the newspaper.

"I do not blame her—but after taking the cure last October I had hoped for a chance to begin over without this publicity and disgrace.

"We lived on the West Side, but were obliged to move away because the children in the neighborhood taunted my little ones and made life unbearable to them."

The sympathy of his children for Mr. De Haven reveals that whatever his failings as victim of drink have been he never has been deliberately cruel to them.

This was testified to in Judge Eberhardt's court by little Lilly De Haven, who said:

"I'd rather have my father as he is now with us at home than to have all the money in the world."

While she testified that her father had been intoxicated much of the time during 1906, she declared that he, sober at home with his family, was much more than any money a suit could possibly bring.

Henry L. De Haven, the husband, who spent almost all his salary in saloons, has become a reformed man since his wife brought her suits. He recently took a cure for drink. His reformation, however, has not altered his wife's determination to get back from saloon-keepers some of the money her husband paid them.

"My husband is a changed man," said Mrs. De Haven, "and even if I didn't get back a penny of the money he spent in saloons I would be a happy woman.

"He frequently earned over \$100 a month. Most of this went to the saloon men. I never saw a pay check. They were always changed in saloons. Two months ago he handed me his pay envelope—the first I had ever received. I warned the saloon men, but it did no good. It came to such a pass that I had to do something to try to stop it or go insane.

"The curse of this rum business is that the saloon-keepers permit workmen to run bills. When a man is allowed to run bills that leaves his family in want there should be a way to stop it. Hundreds and hundreds of dollars has he spent over bars after I had warned proprietors of our sad situation. We have been married nineteen years. I am thankful for today's verdict. I hope other wives who have been left without means of support will follow my example." (Mrs. De Haven was awarded \$600 damage.)

J. KOB, of Iowa, sends us this amusing incident of days gone by:

"Once upon a time, a traveler who approached a hotel late in the evening thus addressed the little son of the landlord: 'My son, detach this quadruped from this vehicle and stabulate him and donate him a sufficient quantity of nutritious ailment, and when the glorious aurora of morn shall illumine the eastern horizon, I will award you a pecuniary compensation for your amiable hospitality.' The son called to his father and said: 'Daddy, daddy, there's a dutchman out here wants to see you!'"

## MISMATED.

D. E. CRIFE.

THERE is no more useful, honorable occupation than tilling the soil. The man who loves this work, and labors faithfully to build for himself a good home in which to provide for those he loves best, yet never forgetting to aspire to a pure and elevated life, never fails to see and appreciate the beauties around him. Such a man as this is worthy of the fairest daughter of earth. In his loyal love she may find all the joy, the content and the happiness that can become the lot of any of the most favored of the race.

A man which we have in mind was a farmer, but he was not quite the kind of a man just named. He was unlearned, unpolished, with little aspiration for more than a roof over his head, and the simplest food to supply his daily wants. He had lived in his mother's home until almost middle life. He had never been more than a day's journey from the place of his birth. Then, thru the eccentricity of fate, such as one sees only once in a great while, he won the heart and hand of one of earth's noblest young women. Just how he ever won such a prize no one seemed to know. Plain and unromantic as he was, he had a little look of joy and triumph on his face as he stood before the altar, with his gentle bride. She was radiant with youth and beauty, as amid her blushes she gazed out of her soft, brown eyes, so full of love and hope, on a world that stretched so beautifully before her then.

All the neighbors came to the old church to see them married. She was remembered by some as the loveliest bride they ever saw, or even expect to see. She was the last scion of a fine old family that once had known wealth and grandeur which the reverses of war had swept away. The aged grandmother was all that was left her now. She had lost her mother in infancy, but had been carefully brought up in her maternal grandmother's home, which, tho a home of poverty, was yet a home of refinement and of something akin to luxury.

After the old southern style, the grandmother had tenderly shielded her from every form of labor, from every care and every harsh contact with the world. She, herself, had become accustomed to practice the strictest economy, yet she spared no pains to prevent the young girl from feeling the blight of poverty and hardship. But generations of poverty and hardship could never have effaced the innate grace and refinement that fitted her as a garment, and made her worthy to be queen of a realm.

Always accustomed to the idleness of genteel poverty, she was ill fitted to enter on the hard duties of a poor farmer's wife. They soon settled down to everyday life in an old mud-daubed log house, on a bleak, stony hillside. Here all the work of housekeeping fell to her frail, inexperienced hands. She submitted to this changed condition with a meekness and

grace that might have taught a lesson to an angel. She tried in every way to adapt herself to the duties and labors of the uncongenial surroundings with gentleness and patience, and without complaint.

The man loved her, perhaps as much as he was capable of loving. He was faithful to her, in a way, and was never intentionally unkind. When he learned that the charming artlessness, which made her so lovely, was largely the result of inexperience and inefficiency for grappling with the duties of life, he may have been disappointed, but he was patient. When he learned that her delicate and fragile beauty was largely founded on the childlike frailty of a body not strong by nature and undeveloped by strengthening exercise, he may have realized that a stronger woman would have been a more congenial companion, but never told her so. While he could not fully understand how unable this delicate creature was to grapple with the hard duties of her lot, nor fully sympathize with her weariness when her tasks were too heavy for her strength, he was patient and uncomplaining.

Still her charms were not enough to hold very closely the one man of all the world, who should never have left her side unless duty called him away. He was not unfaithful, only thoughtless. Before she had scarcely become acquainted with the gruesome old house, he would now and then spend a long evening chatting with his mother, whose house was not very far away, while the fragile wife sat at home alone, trembling as the rats rattled and played in the ghostly garret. He was very fond of dogs and hunting, and frequently left her alone with her charms and her affairs while he followed the dogs over the woodland hills, half of the night, with no higher prospect than possibly bringing home a ten-cent "possum." For days following, his conversation would be about the excitement of that chase. But there are many men who will leave a wife almost as young and almost as fair as this one, and be gone more than a half night, where duty does not call, and when they come home do not even try to share the pleasures of the night with her and bring back with them less than nine ten-cent "possums."

Her only intimate friend was her nearest neighbor, a middle-aged woman, with a large family. Tho often overburdened with work and family cares, her congenial surroundings had kept her heart young, and high aims and ideals were constantly before her. In this strange, half-motherly, half-sisterly companionship the young woman found the one great help to cheer and encourage her in bearing life's hard burdens, and to develop herself for the duties before her. They were an odd appearing pair,—the plain, unassuming mother of a family, and the pretty, gay young wife, still arrayed in her dainty girl dresses. But the wise, kind sensitive sympathy of the one, and the trustful, appealing helplessness of the other, drew them so

close to each other that they were almost inseparable; and each entered so largely into the life of the other, that the influence of those few years will never be lost on either.

There was a peculiar charm about this modest, quiet, low-voiced young woman, that attracted every inmate of this family, where she was almost a daily caller. Every child was glad to see her every time she came, and only too happy to do her a favor. Later on, when she brought a little baby with her, he became the pet of the entire household. In every little perplexity she appealed to this friendly neighbor for advice or help, yet in such a refined way as never to become burdensome.

Time brought its changes! In a few years the family, with whom she had been such a constant caller, went to a far land. Then letters told more eloquently than spoken words had ever done, how this one dear friend had won her undying love, and now that her dear grandmother had gone to rest, was the dearest friend she had on earth. To her, time brought its changes too. Always fragile, sore afflictions had fallen upon her. Child after child had come into the home until she had quite a family. She always finds her tasks far beyond her strength, struggle with them as she may.

During all these years this husband and wife have been faithful to each other as the world calls faithful, but they have never blended their characteristics and peculiarities together so as to become adapted each to each and be all the world to one another. Their differences in life and thought were too far apart for this. No doubt he realizes now that a stronger woman, who could share his labors, and tread by his side thru the woodland he loves, whose thots and aspirations were more in harmony with his own, would have brought more happiness into his life than this delicate, refined woman who has a hundred charms that must remain sealed books to him; but which would have made her an inexpressible treasure to some other man.

In her own home, with her children around her, whom she loves with a true mother-love, she writes to her most trusted friend: "Somehow I have for so long a time had a sense of loneliness in this life, that, try as I may, I cannot overcome. I try always to do the things I think right and best. I often go to God in my loneliest hours and ask him to help me bear the trials humbly in this life. I know full well that while earth may forsake, he never will. We can trust no other friend like him."

It is sad, so late in life to know that something has been missed that might have cheered this life's journey. How important that young people, when choosing a companion, for the long walk, which ends at an open grave, should wisely choose such an one as will be a congenial friend, a suitable helper in all the vicissitudes of life that must be encountered.

# Sympathy vs. Coolness in Child Training

Catherine Beery Van Dyke

"And ye fathers (parents) provoke not your children to wrath; but bring them up in the nurture and admonition of the Lord."

WHEN the child comes into our midst from its previous existence; that is, from its prenatal habitation, its surrounding conditions are radically different. Before birth no chilly wind strikes it, no sight or sound, or odor or taste, reaches its undeveloped senses. The mother's heartbeat has sustained its physical life and her body has enveloped and shielded its body with even temperature and perfect poise. Its mind and spirit were in embryo and the best that could be done for these was for the mother to be kept in calmness of spirit and in a state of loving expectancy, until the time she could clasp her offspring in her arms and gaze into its innocent baby eyes.

But once here, the child must be adjusted to the different physical surroundings. It must be clothed and kept by outside means from cold or draft. The eyes must be kept for a time from the strong light; the process of sustaining and building up the body must be carried on in a different way. Oh, how much depends upon the mother at this time! If she is unwise how much physical suffering she must cause her child to endure. And how many mothers make serious mistakes during the period of gestation! Sometimes through pride the dress of the babe is not what it should be. Sometimes in the press of duties its body is neglected. Sometimes she becomes excited, worried, grieved or angry. She nurses it then and the result to the child is shameful suffering; and if this order of things become habitual, the child cannot develop normally.

During this period the mental and moral life of the child is awaking. Neglect, sooner than anything else, will develop in it a feeling of rebellion and the child becomes "cross." Children are babies more fully developed and "men are but children larger grown," so in order to normal development in the older being, right conditions must be provided now.

I do not believe that a baby is naturally cross; nor do I believe that boys and girls are naturally bad. If they are cross and bad it is because something unwholesome has entered their systems or their lives. Oh, the responsibilities of parenthood! Thank God, they are offset by the possibilities of our children.

Part Two.—When babies are small we fondle, caress and cover them with kisses. When they grow out of infancy we are inclined to show our love less; and by the time they are in their teens, many children have been so entirely isolated from mother and father that they must stem that most dangerous period known as adolescence practically alone,—or sometimes worse—

in the intimate association of other neglected children some of whom may be vicious and unclean.

Here it is, more than anywhere else in their lives, that children need sympathy of both father and mother. It is during these transition years that it requires more patience, more understanding, more love than at any time before or after this period. The child is passing from being a child to the state of manhood or womanhood. The change is not instantaneous. It is a process requiring years to complete; and it is fraught with so much consequence that neither parent nor child can afford to be separated from each other during its progress. Here it is that the text has its most emphatic bearings. "Provoke not your children to wrath." If that were all of the admonition we might, with some shadow of excuse, neglect or violate it through our lack of wisdom or some such thing. But the other part, "but bring them up in the nurture and admonition of the Lord."

"Nurture," nourishment. How soon we begin to pine and be in pain when our stomachs are empty! Just so soon do our children miss us when we put them on the edge of the nest and think they are big enough to fly alone. The nurture we gave them in babyhood was used in those hours. Now it is as much our duty to feed them as then; but we must be careful and faithful in the selection of the food. Then a smile, a soft word, a lullaby, sometimes a timely spanking, was sufficient. Now they demand always the soft sweet word and the smile (just as older people like milk just as babies do) but more than that they need instruction; and here comes the golden opportunity of a parent's life, when he can instill the principles of morality and religion in the heart and life of his child as at no other time.

Oh, God is so wise and so good! Good to give us the dear little helpless things that wean us from our selfishness and bless us with their sweet and sacred presence. Wise, that as they enter maturity and we are at its height or declining, we can have the companionship, the confidence of a fresher, younger manhood and womanhood.

But what will we do with this golden opportunity? Oh, parents, consider it well before these tender difficult years are forever beyond our control.

Do you want your child to be pure? Teach him from your own experience, your own acquired, your own observation, what purity is and have him follow after it by your direction and your example. Do you want him to be a scholar? Do not dwarf his ambition by want of sympathy or coöperation. Do you want him to be thoroughly a man of God? Handle with

him the word of God as though you believed it and believed it to be alive. "Bring him up in the admonition of the Lord." Read the 119 Psalm and see how "the law of the Lord" is exalted. Are you ashamed to bring your child to regard it as David regarded it? "Admonition" does not mean nagging, nor does it mean a sentimental repetition of precepts. But a careful painstaking process of instruction in the word of God, the importance of which is so well set forth in the sixth chapter of Deuteronomy.

"The commandment of the Lord is pure, enlightening the eyes." Educative. Use it.

There is no higher mathematics, nor science, nor philosophy than the spiritual discernment that grows out of a practical knowledge of the Scriptures.

How important then that this admonition be given to children all along the line.

#### THE DIFFERENCE BETWEEN WHAT CHRISTIANS NEED AND WHAT THEY WANT.

ONE of the most flagrant mistakes which Christians make is that of continually wanting more personal liberty in questionable things of a worldly nature. Everywhere churches and pastors are protesting against their members attending dances, races, theaters, euchre parties and many other pleasure resorts. Church members today, as a rule want this privilege and take it, or else they set up the cry of having their personal rights interfered with.

A fatal mistake is made in such cases because, for a Christian to make a success of his spiritual life, he does not need such pleasures. Indeed they are deadening in their nature, and to enjoy them to the fullest extent is to die to higher usefulness and run ninety-nine chances out of a hundred of creating an uncontrollable desire for worse things.

What a Christian needs, if he expects to thrive and enjoy his religion is; constant activity in practicing his private devotions; improving his daily opportunities of leading sinners to Christ. Liberty to do good, and liberty to increase in ability and willingness to die daily upon the Cross that some other soul might be lifted up through him, is the liberty which the soul needs in order to perfect its good growth and powers.

A little liberty in questionable things generally means a desire for downright sin a little later on. Liberty in things not absolutely necessary for a Christian's growth is a compromise on the very face of the matter, because a Christian has no business to ask for, not even think of, things *foreign to his spiritual interests*. Christians are weak at best, hence they need help. Do not forget the fact, because it is fundamental to growth, and how much help does the ways of a wicked and unregenerate world offer a Christian?

If churches would quit stuffing their members so much with theology and church polity and get the en-

tire membership in rhythmic action in saving souls as a daily business, there would not be such a clamor for personal liberties, because the work of Jesus Christ is so fascinating and extremely satisfying to a soul, that the pleasures of this world are but filthy rags compared with the joy which is to be found in seeing sinners born again into new life and fellowship with God.

Are you chafing under church restraint? Here is a cure for such a fever. Spend a few years in continuous prayer, penitence, study and soul-seeking. By that time you will know the worth of this essay. Such a course changed the murderous dispositions of Peter and Paul. It has cured similar cases since then. It is doing so every day. It will do so for you. After Peter and Paul were cured they had no taste nor desire for worldliness in any of its forms, but gloried only in the Cross. God put life into this message that each reader may act out its teaching.

We all need it. You need it.

#### FEAR, ADMIRE, LOVE.

WHICH of these words express your fellowship with God? Do you fear his justice, admire his works, or love his ways? While fear may move a man to begin the Christian life, and an enlarged knowledge of nature and of the soul may cause a man to intellectually admire God's ability there yet remains one stage more into which Christian must develop if he is to enjoy the richness of God's grace. That condition of heart is *love*,—an affectionate regard for the fellowship and service of God. Love kills fear and quickens admiration into a mutual compact with God. You can admire God and yet be outside of his fellowship,—an alien to God. But to love God is to be a part of him in experience and aspiration. Then the success of his work will give you as real a thrill of joy as you would feel to meet your mother after a long separation. Yes, learn to love God, and then the world and all of its ways will lose their attraction.

#### A CONSERVATISM WHICH DOES NOT CONSERVE.

THE word "conserve" means to keep in a sound, healthy state. "Conservatism" means "a disposition to *preserve that which is established*." From these definitions as given by Webster, conservatism does not mean permission to stand idly by and permit things to go to ruin, as so many weak kneed people do, when some trouble arises and they are afraid to either veto the wrong or advocate the right.

Many people take a reserved or inactive man as a conservative man which is not often correct. Conservatism may mean radical measures in order to keep matters in a healthful condition.

# A Million Dollars

Hattie Preston Rider

"I WISH," said Grandma Hillis, "that I had a million dollars."

Mrs. Ward first stared at her and then laughed.

"Just hold my sewing a minute, Grandma, dear, and I'll run and fetch it for you," she answered, merrily.

Grandma Hillis shook her head, albeit her eyes twinkled.

"I know your willingness, my child, and I believe there are people who would gladly give it, if one could get at them, and they understood for what purpose it was wanted. I have been thinking and thinking, since this local option agitation has been going all over the country, what a wonderful lot of good one could do with a million dollars."

"For campaign funds?" Mrs. Ward asked. She still looked as if she suspected a joke lurked somewhere close around.

Grandma Hillis shook her head again.

"I don't know very much of those things," she said. "Wiser brains have to manage them, but with that million dollars I would build half a dozen places in different cities, sort of auxiliary to the Young Men's Christian Associations, where men in their working clothes might be free to go and lounge, and enjoy themselves innocently. There should be baths, books, clean, newsy papers and magazines; also, some sort of lunch counter, where a man might get a cup of hot coffee, milk, or buttermilk, and a bite to eat, for a nominal sum,—It should be an appetizing bite, too, like the free lunches the saloons set out: baked beans, roast meat, and cheese. Of course we know the enormous profits on retailed liquors makes that same lunch free in the saloons, but few men would grudge the payment of a small price for something they really relish, if it could be had in a decent place.

"Do you think that enough people would patronize such a place to keep it going?" Mrs. Ward asked.

"Maybe not," Grandma Hillis conceded. "That's why, I wanted so much money to assure its success, for a time, at least. But I've read of several institutions of that sort in Chicago, under the direction of the Young Men's Christian Association, and founded by different railroad companies. The buildings are situated right at the end of their lines, and afford a pleasant and convenient place for the men to spend their time between runs. They could even cash checks and leave deposits there for their families. There were comfortable beds provided, too, for short lodging, at small cost."

"Some one must have exercised a wonderful lot of common sense in planning it," Mrs. Ward remarked.

"The article said the railroad companies more than got their money back, in good service." Grandma Hillis went on to say. "It is said that several saloons, I forget how many—in the same block with one of these associations, had gone out of business since the place was established. It's my opinion, Jennie Ward,"—the speaker's lips took on firm lines,—that not one man in ten would ever go into a saloon to say nothing of hanging around there, if he had any other comfortable place where he felt free to go!"

"Why doesn't he stay home, then?" Mrs. Ward asked, promptly.

"All homes being so very pleasant and attractive!" Grandma Hillis responded, with unlooked-for sarcasm. "But then," she amended, more gently, "of course some homes *are* pleasant, and some wives so agreeable that they keep their husbands courting them all their lives. Even then, men like to go out among their own friends and working associates once in a while. It's natural and right. They like to talk about a hundred things women don't understand or care for. We could get rid of the liquor evil lots more quickly, if we could take all the light and warmth out of saloons and put them in a decent place, with attendants whose friendliness was real, instead of a glossed-over desire to get all a man's money at the expense of his manhood. Fill up a human soul with rightness, say I, and there's no room left in it for wrong."

Thoughtfully, Mrs. Ward folded her sewing.

"Well, I must be going," she said, "for the children are coming home from school. They seem lonesome if I'm not there, but I heartily wish, Grandma,"—with a half-laugh and a big sigh—"that you had that million dollars!"

Grandma Hillis nodded brightly.

"It'll come, even if not to me," she declared. "Jennie Ward, I'm growing rich over such women as you, who make it their first care to keep a warm nest for the 'wee men to come.' There isn't room in any woman's life for motherhood and a lot of other interests too. If they all looked at things as you do, the grandmothers of the future wouldn't need to be wishing for a million dollars."

ALCOHOL will remove grass stain from summer clothes. It also removes summer clothes and spring and winter clothes, not only from the man who drinks it but also from his wife and children. It will move household furniture from the house and eatables from the pantry; the smiles from the face of his wife and the happiness from his home. As a remover of things alcohol has but few equals.—*Payette News*.

## OUT OF MY SCRAPBOOK.

EFFIE E. MILLER.

A FEW years ago I received from my father, a scrap-book, as a Christmas present, and since then I have pasted in it all the clippings I wished to save. Most all of the first page is poetry, and a few of the subjects are: "Brother Ralston's Experience," "Mount Auburn," "My Childhood," "An Evening Reverie," "There is no Death," "The Family Album," and "The Crippled Child." In the second column of page two, I find this: "You can generally count on the man who is patient with children, and courteous to women; who likes music and loves flowers."

How true! but how many are always patient with the little ones, who have so many things to learn, and ask so many simple and perplexing questions? How many are always courteous to women, no matter whether they are elegantly and stylishly dressed, or clothed in a simple, neat way? How many always like music,—not the so-called classical music so popular in fashionable society today, but the inspiring kind that uplifts humanity, elevates the soul, and awakens a deeper reverence for things that are higher, nobler, purer? How many always love flowers, which are one of the many things God saw fit to place on earth to make it pleasanter? Surely all those who meet these requirements can be relied upon.

On this same page, "Looking Backward," "Face to Face with Trouble," "The Drunkard's Sermon," "The Sin of Omission," and "Sunshine," are found. On another page I notice this:

"Life is a voyage,  
Travelers are we—  
The soul is the vessel,  
The world is the sea.

"Life is a picture—  
The canvas is Time—  
Events are the colors  
That man must combine.

"Life is a poem  
Most beautifully ended,  
When gladness and sorrow  
Are beautifully blended."

This reminds me of another definition of life. A few years ago four young lady friends and myself went to call on another young lady. Arriving at her home, we were somewhat surprised to hear that she had gone away that morning to be married. During our conversation about her marriage, the mother remarked: "I'll tell you, life is a great undertaking." This impressed me, but not so much as the father's response, which was: "Well, life is a great *undertaking* anyway we take it." He is a deep-thinking, God-fearing man, and has

always met life's struggles bravely, but nothing he has ever said or done has struck my mind so forcibly as that. Many times have I thought of it since, and more and more do I realize the truth of his words.

But let us not shrink from the great undertaking, but remember that, "every hardship, every joy, every temptation, is a challenge of the spirit, that the human soul may prove itself."

Another column is "Little Sermons," by D. L. Moody. On another page are some short definitions of "The Favorite Girl." The following are the two which I thought best: "She is the girl, who, whether it is warm or cold, clear or stormy, finds no fault with the weather." "She is the girl who makes the world a pleasant place because she is so pleasant herself." On the opposite page is, "Among My Photographs," "Hints to Book Lenders," "A Rainy Day," "In an Old Album," "Some Christmas Thoughts," and

"Once in a while, in the desert land,  
We find a spot of the fairest green;  
Once in a while from where we stand  
The hills of paradise are seen;  
And, a perfect joy in our hearts we hold,  
A joy that the world cannot defile;  
We trade earth's dross for the purest gold,  
Once in a while."

Jonesboro, Tenn.

A Moment of Excitement.

## CREAM OF MAGAZINES

### INTERESTING FACTS ABOUT RUBBER.

The extensive use of rubber warrants the statement of a few facts concerning its manufacture. Everyone knows that it is practically impossible to find a pure rubber article on the market in these days, and one often hears the rubber manufacturer arraigned as a conscienceless defrauder. But let the public, which stands in judgment on the manufacturer, stop to consider its own part in the case. One concern informs us that it pays \$1.40 per pound, wholesale, for crude Para rubber, and 23 cents per pound for canvas, yet it makes up and sells rubber hose for 25 cents per pound. Problem: Find the profit. There is no method of adulterating canvas, although to be sure it forms a relatively small part by weight of the hose. If any profit is to be made, it must come out of the rub-

### Reclaimed Rubber.

Scrap rubber, or rubber "shoddy" as it is called, is made up principally of worn-out boots and shoes, but includes every conceivable form of worn-out or disused rubber, ranging from old hose (the poorest grade) to the inner tubes of bicycle and automobile tires, which may be as high as 95 per cent pure rubber. The material is first ground very fine. It is then treated by what is known as the "mechanical" process for removing all foreign substances. This process consists of a series of magnets, sieves, and blowers, through which the material passes until every particle of metal and foreign matter is removed.

### Manufacture of Rubber Hose.

In the manufacture of rubber hose the sheets of

unvulcanized rubber are cut into strips and fed into a tube-forming machine. This machine is somewhat similar in its action to the common household meat-chopping machine. A worm or screw conveyor feeds the material from the hopper to the tube-forming head. The latter is provided with an aperture of the required size, in which a core is centered. The machine is sufficiently heated to maintain the rubber in a plastic condition, and in this state it is forced through the die, giving it the re-

Making Sheets of Rubber.

ber, and the public which refuses to pay more than one-fifth as much for the finished product as the manufacturer does for the raw material, should find no fault with the quality of goods it receives. Were it not for the invention of a process for reclaiming old rubber, the lot of the manufacturer would be a hard one. Fortunately for him, he is not dependent upon the forests of Brazil or Central America for the precious gum. Rubber has been imported into this country for nearly a century, and since the material is proof against all ordinary deteriorating influences, it follows that the country is stocked with a large supply of the material, in scrap form, to be sure, but rubber nevertheless, and capable of being reclaimed by a simple process and remanufactured into new goods.

quired gage, and issues from the machine in the form of a seamless tube strongly knit together, which is coiled in a spiral on a slowly-revolving table. The tube may be made in any length desired, because, owing to the soft, plastic character of the rubber, each strip is pressed into the one ahead, and the hose issues without joints. For convenience in handling, the hose is usually cut into 50-foot lengths. In order that it may keep its shape while the canvas reinforcing layers are applied, it is mounted on a long iron rod which snugly fits into the hose. The successive layers of canvas are added by a separate machine after the canvas has first been coated with rubber.

The making of fruit jar rings is a much more economical process of manufacture, as it entails no loss in waste cuttings. The material is made into tubes on a tube ma-

chine of the same type as that used in the manufacture of hose. The tubes are vulcanized, and are placed on a mandrel and mounted in a lathe. The rings are then cut off by an automatic mechanism, which alternately presses a sharp knife against the rapidly-revolving rubber tube, and, between cuts, feeds the knife laterally a distance depending upon the desired thickness of the rings, which is

Making Rubber Mats.

governed by a ratchet. These lathes, as they are entirely automatic, run at a very high rate of speed, reducing the cost of cutting to a minimum, which enables the manufacturer to offer a better quality product today, even in the face of much higher prices for raw materials.—Scientific American.

#### CUBA'S IMMEDIATE NEEDS.

Cuba, it will be conceded, needs at once:

(1) A great, practical, educational development along the lines of practical experience in self-government, exercise of personal rights, and self-control must occur in Cuba before any republican form of government can be successful without outside aid and support.

(2) That aid and support must come from the United States. It is practicable to give this aid without annexation, without incorporating Cuba into the political system of the United States, thus adding an element of weakness, rather than strength, to our own institutions.

(3) That aid must come in the form of settled commercial relations as soon as the termination of existing treaty obligations will permit; and in the form of wise initiative, discreetly exercised, looking toward such changes in Cuban laws as will develop in her people capacity to appreciate free institutions, and govern themselves under a republican system. These changes must look toward reduction of the paternal attitude of the central government, with corresponding exercise of greater power by local authorities.

There appears to be one way in which these ends can be accomplished within American limitations without injury to the self-respect of the Cuban people. The educated Cubans see, clearly that a period of tutelage is necessary. The uneducated Cuban cares nothing about politics, really; what he wants is results. He would just as

leave has these results flow from a paternal autocracy as from the most liberal democracy. He is ignorant of the machinery by which results are accomplished; but he knows conditions are hard for him, and will welcome whatever ameliorates his hardships, provided it be a genuine amelioration. Promises alone will not keep him quiet; they would only dam up the waters of revolution to bring on another and worse inundation.

A "protectorate" over Cuba already exists. We have the facts, however it may be called. Names matter little. That protectorate must take some form for the immediate future which will permit of preventive, as well as corrective, measures. The present intervention is purely a corrective measure, not initiated until the mischief was done. For the future there must be a system that will prevent a recurrence of such troubles by terminating the conditions that create them.

#### A "Council of Advisers" for Cuba.

Previous to the date on which the Treaty of Paris terminates, February 4, 1909, a new treaty should be negotiated with the Provisional Government of Cuba, to take effect at that date. This treaty should contain not only a definite adjustment of commercial relations between the two countries, but also the necessary authority to institute and maintain a Council of Advisers in Cuba. The re-establishment of the Cuban Republic, like its first organization, should be made conditional upon its acceptance of the provisions of this treaty.

The Council of Advisors should consist of one president, one advisor for each department of the Cuban Government when necessary, as for example, the Treasury Department, Sanitary Department, and that of Foreign Affairs, and one for each province. Each member thereof should be an American, entitled to the diplomatic privileges in Cuba, and an official of the United States, not of Cuba.

The functions of these officials should be threefold: to observe, to propose, and to exercise the judicial functions hereinafter described. Thus each adviser to a province would exercise the right of proposing measures to the Provincial Council. The advisers to the several departments of government would exercise a similar right. The Council of Advisors as a body should have the right to propose such legislation as might seem expedient to the Cuban Congress, and in their collective action would exercise the judicial function to be described. All proposals would be merely advisory in character, and therefore would not curtail the legislative rights of the Cuban bodies. Diplomatic privileges are given to render these officials as nearly independent and impartial in the discharge of their duty as may be humanly possible. It should be provided by the treaty that no adviser may hold or acquire any property interests in Cuba during his incumbency, nor receive any emolument or perquisite whatever from the Cuban Government or from any citizen thereof during his incumbency.

The English system in Egypt illustrates what must be done. The Khedive's government has remained intact; but Lord Cromer had the initiative in such measures as were deemed essential by the British Government. An exactly similar system in Cuba is not advocated. It would be plainly impracticable, owing to our different form of government at home, with responsibility to a legislative body, as well as to the executive. But some of the features of England's Egyptian system might well be incorporated into the future relations between Cuba and the United States.

For the United States the indispensable things are:

# Echoes from Everywhere

## NATURE AND SCIENCE NOTES.

Exposure to radium for a month, in Professor Bordas' experiments, seems to have changed light red corundum to ruby, violet to sapphire blue, and blue to emerald green, while white became topaz yellow.

The abundance and variety of ants is a striking feature of the animal life on the southern slope of the Himalayas. The snow-line there rises 6,500 feet higher than in the Alps, and Dr. Forel has recorded four species at a height of 12,000 feet, while of 112 species known in these mountains, not less than fifty are local, found only in the Himalayas.

When the law, permitting the free distillation of denatured alcohol was passed, it was generally supposed that farmers all over the country would start small stills in order to take advantage of it. Scarcely a single still has been built, however. Dr. Niley, the government chemist, explains the fact as due to the ignorance of the farmers as to how to run a still. He will do what he can to remedy the difficulty by setting up a still at Washington, where he will develop alcohol from spoiled fruit and cheap vegetable substances, and ask representatives from the agricultural colleges to come to Washington to see how the still is made and worked.

By next summer the nation's war balloon should be launched. The War Department has received six bids for the balloon, running from \$5,000 to \$25,000, and promising delivery in from three to five months. The War Department balloon must carry two people, weighing 350 pounds, with 100 pounds of ballast additional, and must make twenty miles an hour in still air. One bidder offered to make a balloon with a speed of forty miles an hour for \$30,000.

## Plant Culture by Electricity.

H. F. Hughart, a Minneapolis florist and gardener, believes that he has solved the problem of growing vegetables during the short days of the northern winter. He has installed electric lights in his greenhouse, to be used thru the night as a substitute for the rays of the sun. After two weeks of this treatment, the lettuce plants exposed to the light, were one and one-fourth inches taller, and forty per cent heavier than the plants that were shielded from the light. Under present conditions, the gardener considers three crops of lettuce during the winter months, a good yield. Mr. Hughart thinks he will be able to raise four crops during the same time by the new method.

## FOREIGN.

The French postoffice has introduced a new scheme. When a man misses the last mail at night, he may pay a small extra fee and have his letter telegraphed to the

postoffice of its destination. There it will be written out and placed in an envelope and delivered the next morning by a postman on his first round.

The opening of the British Parliament on January 29 was not disturbed by demonstrations on the part of the women suffragists, as had been feared; but variety was supplied by a man named Roe who pretended to be a peer, claiming to be Lord de Morley. He was ousted from his seat by a watchful usher. This is the first recorded occasion of any unauthorized person entering the House of Lords and taking a seat as a robed peer, although two or three attempts to do so have been made. No penalty attaches to the offense and Roe will be allowed to enjoy the honor of his feat.

Last week there was sold at a London auction an old American flag which was represented to be the one that floated on Captain Lawrence's man-of-war, the Chesapeake, in the War of 1812. The purchaser, who is said to be Cornelius Vanderbilt, paid \$4,250. Now very great doubt has been thrown on the authenticity of the flag. An investigator for the New Jersey Historical Society says that the Chesapeake flag is buried with Captain Lawrence in Trinity churchyard, in New York City. The present flag he thinks, might possibly have belonged to the United States ship President which also took part in the War of 1812.

Following the example set by the smaller English cities last summer, London is to have a great pageant next July. The first of the eighteen scenes will be a prehistoric spectacle introducing King Lud as the founder of the city. The last will be the great fair in Hyde Park in the coronation year of Queen Victoria. Other scenes will consist of a great Roman sacrifice to Diana on the site of the present St. Paul's Cathedral; the return from the Crusades; Queen Elizabeth's reception of Drake, including festivities on his arrival in which the dance from "The Midsummer Night's Dream" is given by the ladies of the court; and Charles I. on his way to Whitehall to be executed.

The new Governor-General, of Odessa, one General, Tomaltcheff, has set about fighting the revolutionists after an extraordinary method. Last week the police discovered a bomb in a public tea room. After the place was cleared and closed, they reported their find to the Governor. He ordered the bomb to be exploded where it had been found. The order was carried out, with the result that the entire house where the tea room was located was destroyed. The General announces that this will be his method of fighting revolutionists. It seems like cutting off one's nose to spite his face, but perhaps it will be effective in Odessa. The revolutionists might leave a bomb in the Governor-General's palace and see whether he would have it exploded there for them.

A canal from Lake Constance and Basle to Genoa! That is the plan of a Milanese engineer, Pietro Caminada. Moreover, the King of Italy is greatly interested in the scheme, which involves the building of tunnels and of sluices on a new plan. Caminada estimates that the cost would be \$110,000,000, and that the canal would have an annual business of 15,000,000 tons of freight. If the canal were built grain, wood and cotton could be conveyed via Genoa more cheaply than from Antwerp on Rotterdam, whereas at present the cost by the shorter southern route is more than double that of the northern. The most serious objection to the scheme thus far advanced is that in the higher Alpine regions a sufficiently abundant water supply might not be obtainable.

#### Canada Enforcing Sunday Laws.

Winnipeg has put on the Sunday lid. The local branch of the Dominion Alliance has been agitating for closer Sabbath observance. A recent raid caught about three hundred Sabbath breakers, including newspaper reporters, cab drivers, merchants taking stock, railroad employes, druggists, shoe-shine artists, livery men, newsboys selling American Sunday newspapers, restaurant and hotel keepers, fruit venders, and even one minister who was performing a ceremony. All are supposed to have been pursuing their occupations in violation of the new Sunday act, which specifically says that no work is allowed except it is a necessity or an emergency.

The law hinges for its enforcement on the initiative of the provincial authorities: and therefore, the citizens must be first reported to the attorney general of the province, who will then decide as to whether action is to be taken or not.

A Frenchman, named Lemoine, has been claiming that he had found a formula for manufacturing diamonds. His formula was published in order to show the world that it was genuine. Now it turns out that, at least, part of the diamonds he displayed as coming from his crucible were bought from Paris jewelers. Lemoine's method of making jewels seems likely to be as useful as the method of burning ashes exploited last summer.

A much larger number of Japanese have been returning home from the Pacific coast during the last week or two than usual. The steamers from San Francisco, which commonly carry ten or a dozen at this time of the year, have been taking from ninety to two hundred of late. The Japanese have refused to tell why they are going back, saying only, "We have to go back home." The theory is that the Japanese government has ordered the army reservists to report at home, since many, if not all, of those sailing had served in the Manchurian war.

Cuba has had peace and quiet for a good while now, but she has not yet paid any of her debts. The cost of the American occupation up to January 1, was a few thousand under four and a half million dollars.

#### GENERAL.

##### Mild Winter for the North.

On Tuesday, February 4, the first real snow storm of the season came down on central North Dakota. Up to that time, there was not snow enough for even the lightest sleighs. The snow came with little wind, and no great fall of the temperature. It continued for the better part of two days, covering the ground to the depth of about

eight inches. This is welcome to the farmers, who depend on the sloughs and pot holes for their supply of wild hay. The snow water generally runs into these sloughs, filling them and insuring a growth of hay. Evaporation from these numerous ponds, also produces local showers, which keep the crops growing till the heavy June rains come.

President Roosevelt has deposed Mr. Stillings from the government printing department on the charge of graft and extravagance in public funds.

New York.—Chas. Morse, president of a \$60,000,000 steamship trust and nineteen banks has failed. All his affairs are now in court. His home is attached and the multi-millionaire of one year ago is now out of business and penniless.

Far from trembling before "modernism," the Bishop of Madrid, Spain, has instituted sociological courses in all the Catholic seminaries of his diocese. The teachers are laymen. Four courses are given: Social law, social economies, social economies and the social activities of the priest.

The sweeping statement, recently made, that women are responsible for most bad books that are written should have an addenda. The gentleman making the charge should define what, in his estimation, may be termed a bad book. Critics are in disagreement thereupon, and some even object to the Bible.

Zola sinned against art in his selection of material. Victor Hugo did not. Let women have credit for writing some books that have uplifted the world!

A number of members of a sect which call themselves "Followers of the Holy Ghost" are waiting in New York for an opportunity to go to South America. These people claim to have the gift of tongues. They go into spasms in which they talk gibberish which they claim to be foreign languages. The men and women who are waiting to go to South America claim that the language they speak is Portuguese. One member believes that he speaks Turkish, and means to go to Turkey. One of the leaders, O'Reilly, tell this story to show that "Followers of the Holy Ghost" may certainly expect ways and means to be provided: "One night I was walking in Phoenix, Arizona, with one of my brothers of the faith. We were both ravenously hungry. We had no money. But we knew God would feed us. When I got to be very hungry I heard a voice from heaven say: 'Look at thy feet. See the loaf.' I looked down, and there at my feet was a loaf of bread, hot and fresh.

#### How Chinese Take the Civil Oath.

During the trial of a gambling case in the city police court of Minneapolis it became evident that one of the witnesses, Tom Lee, a Chinaman, was not telling the truth. Jim Mar, another Chinaman who was pushing the prosecution, declared that the Chinaman did not consider the ordinary oath binding on him, and that to secure the truth, it would be necessary to swear the witness by the Confucious oath, which is taken over the blood of a chicken.

Having become satisfied that the witness was not telling the truth, the judge ordered him taken to the basement, and to be sworn over the blood of a chicken. Peter Nelson and his deputy, H. W. Tisdale, took Tom Lee downstairs. A chicken was taken from the crate by Cap-

tain Martin Burfering, and held in readiness. Nelson held a long knife, and Tisdale stood ready to administer the oath. As the knife was handed to Lee, he shrank back, looking around excitedly as if seeking protection. Beads of perspiration broke out on his forehead. No help coming, he cried out loudly, "I won't, I won't do that thing. It is nothing. I won't be a fool." Again he was offered the knife, but the Chinese drew back and turned as if to flee. At this point his attorney interfered. He was then held under bonds for further examination. It would be curious to know just what his view of the oath is.

The United States secret service agents in New York recently seized two thousand rifles and two hundred thousand rounds of ammunition which had been intended for the Haytian revolutionists, as well as some \$400,000 in Haytian notes, printed to pay the revolutionists bills. In the same connection they have arrested Joseph N. Gordan, who was trying to ship the guns and the money to the troublemakers.

We often talk of our inferior position as a ship-owning and ship-sailing nation; but the figures show that Great Britain was the only nation in the world which built a larger tonnage of ships last year than we. We built nearly five hundred thousand tons—488,000, to be exact—while the Germans built only three-fifths that amount. The British with 1,673,000 tons to their credit, built toward three and a half times as much as did we.

#### RELIGION AND HEALTH.

Chicago, Ill.—The new system of healing by Christian psychology, as practiced by Bishop Fallows' corps of helpers, has aroused much interest all over the United States. Scores of sick people have applied for treatment and have confessed a cure.

The bishop practiced his doctrines long enough before announcing them publicly to know his ability to relieve many forms of suffering. Of course he does not deal with contagious diseases or cases needing surgical skill, but old chronic complaints associated, more or less, with mental conditions are his chosen diseases. Good circulation, helpful suggestion, and hopeful anticipation are tonics for such cases just as real and effective as is bella donna, quinine, or nux vomica. Healing both body and soul is a forgotten art in this scientific age.

#### A NATIONAL UNIVERSITY.

Washington, D. C.—A movement is being made to induce Congress to found a National University for higher education so as to supplement what state universities are now doing. Leading educators have been working toward this end for several years with increasing favor all the while.

The bill was drafted by Dr. Edmund James, president of the University of Illinois, and is signed by himself and the following university presidents:

W. O. Thompson, Columbus, Ohio; Brown Ayres, Knoxville, Tenn.; Benjamin Ide Wheeler, Berkeley, Cal.; Charles R. Van Hise, Madison, Wis., and James B. Angell, Ann Arbor, Mich. Elmer Ellsworth Brown, Washington, D. C., commissioner of education, is another signer.

The bill calls for an appropriation of \$500,000 and stipulates that unconditional gifts, legacies, and donations may be accepted.

The purpose of the university is to promote science, pure and applied; liberal and fine arts, and the higher education of men and women in the public service of the

state or nation, and to cooperate with scientific departments of the federal government.

The standardizing of state universities is advocated, as also the creating of experimental engineering stations.

#### PENSIONS FOR RAILROAD MEN.

Portland, Me.—The Grand Trunk line has installed a pension system claimed to be the most generous in the country, embracing every employé of the railroad in the United States and Canada. There are 35,000 employés of the company.

A compulsory retiring age is fixed at 65, while any employé who has served for 15 years or more will be entitled to a pension on a graduated scale, according to the number of years served.

The rate of pension has been fixed at 1 per cent of the average yearly salary for the highest 10 consecutive years of service, the 1 per cent being multiplied by the number of years served. A minimum pension has been fixed at \$200, while there is no maximum.

In addition to this provision is made for employés who have been disabled in the company's service and also for men dismissed without cause under 65, but who have not served over 15 years.

Other roads have tried this system for a generation past with gratifying results. Many large cooperative factories have also demonstrated the worth of the same principle in business.

#### THE POWER OF A JURY.

Jackson, Miss.—Altho the nation is supposed to be superior to any state, yet, when a jury fails to convict or even regard the international treaties it is hard for the government to act justly in such a case.

The United States has promised in the treaty with Italy that Italian citizens residing in this country shall receive "the most constant protection and security for their persons and property."

The Italians in Mississippi are reduced to a state of peonage—of semi-slavery—in defiance of federal laws, but the national government cannot enforce its laws and treaty stipulations.

When a federal jury composed of Mississippians refuses to indict other Mississippians who have violated the peonage laws the national government is helpless. It will be obliged to tell the Italian government, if it be an Italian citizen who is held in quasi bondage, that notwithstanding the treaty pledge it cannot protect him. That will be humiliating, but it will be inevitable.

#### WANT AND EXCHANGE

To accommodate some of our readers and bring them in closer touch with each other, we have opened this "want and exchange" column.

Rates, twenty-five cents per insertion, not exceeding four lines, including name and address. Five cents per line for additional lines. However, no "want" may exceed six lines altogether.

WANTED.—At once. A reliable man with good recommendations. Married. Experienced in pipe-fitting, well pump work and work in hardware store. Work all the year round. Address Levi Zumbun, Brookville, Ohio.

FARMS FOR SALE in Elkhart County. Good improvements. From \$35 to \$65 per acre.—M. H. Miller, Bristol, Ind.

WANTED.—To sell 1,000 sq. ft. new steel roofing and siding. Corrugated sheets 22 in. x 8 ft., painted red. Price \$15, including nails. A bargain. Just the thing for farm buildings.—J. B. Holoepeter, Pentz, Pa.

# BOOKS! BOOKS! BOOKS!

## Bible History

By Rev. Alfred Edersheim, D. D.

Seven volumes, 12mo.

1. The World before the Flood and History of the Patriarchs.

2. The Exodus and Wanderings in the Wilderness.

3. Israel in Canaan under Joshua and the Judges.

4. Israel under Samuel, Saul and David to the birth of Solomon.

5. Israel and Judah from the birth of Solomon to the reign of Ahab.

6. Israel and Judah from Ahab to the Decline of the Two Kingdoms.

7. Israel and Judah from the Decline of the Two Kingdoms to the Assyrian and Babylonian

Captivity. Containing full Scripture references and subject indexes to the whole series.

Regular Price, per set, .....\$7.00

Our Price, per set of 7 volumes, f. o. b., Elgin,.... 3.50

Will send, express prepaid, for 75 cents extra.

## Mr. World and Miss Churchmember

By W. S. Harris.

It is a forcible allegory, somewhat after the style of Pilgrim's Progress, but in no sense an imitation of it. Fathers and mothers, it is the book that you should get for your son and daughter, and at the same time read it yourself. You will be stronger for the church after having read it. It illustrates vividly how Satan lures the church member, step by step, from the pure Gospel,

till finally he is lost forever. Send in your order at once and you will never regret it. Cloth only.

Our Price, Prepaid .....\$ .75

## Sands of Time

A Book of Birthday Gems. Containing a Text, a Proverb, and Sentiment for every day in the year. Also spaces for signatures. By Thomas W. Handford. Bound in cloth. Stamped in gold and white. Gilt edges.

# ALBERTA

**¶ Of Alberta a distinguished writer has said:**

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

**¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.**

**¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.**

**¶ Why not join the colonies already there and enjoy some of the material benefits as well as help build up one of the largest and best colonies in the Canadian West.**

**¶ We have excursions every first and third Tuesday of the month.**

## ROGUE RIVER VALLEY OREGON

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

#### TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

#### DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

#### DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

## If You are Going It Is High Time You Are MAKING ARRANGEMENTS

ON the 3rd of March we expect to have about a car load of people leave Chicago, over the Northwestern line, for Omaha, where we expect to meet another car load of people from Duluth, and a third one is to be made up at Omaha by people from different points in Iowa, Missouri, Kansas and Nebraska. This is our first spring excursion to BUTTE VALLEY on the low rates.

Mr. E. M. Cobb and Mr. E. T. Merritt have been lecturing and showing stereopticon views of Butte Valley in the city of Duluth, Minnesota, and some forty applications were taken for homes in Butte Valley. Not all of these people are going on the third of March, but we expect enough for a car load. Several others have left the selection of their lands to friends of theirs who are going on the excursion. This is a very satisfactory way to do when one can not get away at that time.

The price of land is likely to advance immediately after the excursion and these people are anxious to take advantage of the low rates, as well as the low prices of land. Since the fruit men from the north have investigated the Valley and spoken so highly of its merits as a fruit country, the people can readily see that an investment in Butte Valley Lands is not only likely to double itself, but do so very shortly. Some of the people right north of there, last fall, sold their fruit unpicked for a thousand dollars an acre. Of course it will take four or five years for an orchard to get in bearing, but that is all the more reason why the trees ought to be planted at the earliest possible date.

The proper thing to do would be to go on the excursion of March third, clear off the sage brush this spring, plant the ground to potatoes, onions, or grain, and set the apple trees this fall. Get some good orchardist to select high grade Newtown Pippins, Spitzenbergs, and Winter Banana Apples. Those seem to be the favorites of the oriental markets and bring the highest figures. The orchardist could care for the trees properly while young, which would insure a fortune a few years hence.

After reading this you will hardly have time to correspond with us and get an answer before March third, so you had better write to,

# The Riddle of Life

A noted author has said that life "is a riddle and the key to the riddle is another riddle." This applies with equal force to life in all its phases, including our physical existence. It is indeed, a mystery. Much has been written in a scientific way as to what life consists of, but very little is known beyond the fact that the blood is the life. Even in ancient times, it was written "and the blood is the life thereof." Accepting this fact as our foundation, we find the blood to be the most important part of our physical being and it emphasizes the necessity of keeping our life stream pure and vigorous. To ignore this fact is but to invite physical pain and suffering.

A weak or impure condition of the blood shows itself in a thousand different ways. We meet people every day who appear pale and in a certain sense, bloodless. They have blood enough, but it is thin and vitiated, lacking in power and warmth; others again are florid, showing an abundance of vital fluid, but pimples and skin eruptions betoken its impure condition; others again by the peculiar color of the whites of the eyes and yellow skin, show that the blood is charged with bile owing to an inactive liver; while here and there we find a rheumatic, tortured by the presence of uric acid in the blood as a result of weak kidneys, and so on in many different ways.

All these conditions are bad. What is needed is a good reliable remedy that will cleanse the blood of its impurities, revitalize and enrich it and quicken its circulation. There are thousands of so-called blood medicines to be had. A few are good, some are bad and the rest indifferent. Any medicine that moves the bowels, however drastic its composition, is advertised nowadays as a blood purifier.

The purpose of this article is to call attention to a remedy which is without a peer as a blood-purifier and health-giver and which has the record of a century's constant use behind it. It is known as DR. PETER'S BLOOD VITALIZER and thousands upon thousands have testified to its remarkable power. It not only cleanses the vital fluid but makes rich, red blood and sound, solid, healthy flesh. When you commence to use it, you will not remain long in doubt as to its effect. The very first bottle will demonstrate its merits.

---

## Saved His Life.

Toledo, Wash., July 5, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—The medicine arrived all right about three days after I had written you. I have sold seven bottles already and am almost out of the Blood Vitalizer. I have only three bottles left. I am ordering two dozen bottles this time, as the demand is increasing. Not a word of complaint have I heard; only praise about your medicine. Your dealings with me have been honest and correct. I am your friend in truth. Your medicine saved my life, and I shall always be your friend. May God bless you for making such good, honest medicines.

Yours very truly,

James Turner.

## A Grateful Woman.

New York, N. Y., April 2, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—Gratitude is what prompts me to write and tell you what your medicines have done for me. I was a sufferer from sick headaches and had consulted five different doctors and taken their medicines without success.

After using the Blood Vitalizer a short time I felt relief and in three months I was completely cured of my trouble, and in spite of my old age I have had no return of my former sickness.

In order to help suffering humanity I am at all times glad to give information about your medicine.

Respectfully yours,

Anna Nisly.

1560 Ave. "A."

---

DR. PETER'S BLOOD VITALIZER is known as a plain household remedy. It comes in a plain bottle in a plain wrapper, but it brings results and therein lies the secret of its success and everincreasing popularity. It is distinctly different from all other medicines. It may have its imitations but it has no substitute. DR. PETER'S BLOOD VITALIZER is not a drugstore medicine, but is sold to the people direct, through special agents appointed in every community. For further particulars address:

# RAISIN CITY COLONY

## Procrastination is the Thief of Time

Don't wait a year and then pay \$100 per acre for land that you can buy now at \$40.

Buy you a home in our "RAISIN CITY COLONY" and live happy in the land of SUNSHINE and FLOWERS.

Postoffice is established with A. W. Vaniman Postmaster. The Hotel is now completed and doing a prosperous business. Raisin City Lumber Company has a large stock of Lumber and is doing a flourishing business.

RAISIN CITY is located on the Southern Pacific Railroad, 14 miles from Fresno, a city of 25,000.

### DAIRYING AND STOCK RAISING.

This land is especially adapted to dairying and stock raising as it is the home of the alfalfa.

### RAISINS, PEACHES AND FIGS.

Fresno County, in which RAISIN CITY is located is the greatest fruit producing county in the world, 80,000 acres in grapes.

### SOIL AND WATER.

The soil is a rich, sandy loam; the land is generally level and ready for the plow; and abundance of good water.

### PRICES AND TERMS.

We are selling the land at from \$25 to \$50 per acre on 4 years time at 6 per cent.

# Possibilities of IDAHO

---

## Unlimited

---

Many settlers are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for young and old of small means to get good comfortable homes with a splendid income.

### Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

## Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake

Respectfully,  
John R. Newton.

Pullman, Washington

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

## Realize \$1,000.00 Per Acre

### Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

### Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

## HOMESEEKERS' ROUND TRIP TICKETS

## Subduing Wild Rivers

Guy Elliott Mitchell

WORK OUTLINED BY PRESIDENT FOR WATERWAY IMPROVEMENT WOULD LEAD TO COMPLETE FOREST PROTECTION, VAST RESERVOIR CONSTRUCTION AND ENORMOUS WATER POWER DEVELOPMENT. STREAM GAUGING WORK OF GOVERNMENT IS FIRST STEP IN THIS GREATEST INTERNAL DEVELOPMENT EVER UNDERTAKEN

SINCE his first message to Congress six years ago, President Roosevelt has been prominently before the public as the most vigorous conservator of our natural resources that has occupied his high official position, if not at any time in the history of the country, at least in recent years. No question of internal improvement that comes to his notice does not find in him a ready advocate; no feature of the waste or spoliation of national resources does not immediately insure his vigorous repression, even to the extent, as many charge who may be benefiting thereby, of stretches of federal authority.

The great river and harbor appropriations of Congress have been variously characterized as "grabs," "steals," "wastes of public money," "treasury raids," etc., especially that part apportioned for the so-called improvement of inland water-ways for which nearly \$150,000,000 has been spent during the past ten years. Yet the President in his recent speeches in the Mississippi Valley cities and before the Inland Waterways Commission vigorously advocated increased national expenditures and pledged his ardent support for inland waterway improvement. The difference between his attitude and that which Congress has held in the matter is that he insists the work shall follow out definite and well considered plans and in the future each project be carried through to completion, rather than that it shall be of a hit and miss nature—makeshift, temporary work, which has, during the decade mentioned, characterized the work of the Army engineers, made neces-

sary by the limitations placed upon them by Congress.

The President stated the obvious truth, which however, seems to have been lost sight of by Congress in providing for river improvement, that the springs and the rivulets on the mountain sides must be preserved, if the water flow of the great rivers lower down is to be regulated. The protection of the forests will largely regulate the stream flow and prevent too startling variations between drouths and freshets; but following this idea further and directly bearing on river navigation, natural basins in the mountains, built into reservoirs will greatly aid in river regulation and as the system is made partially or wholly complete, mitigate or entirely overcome the evils of floods and at the same time provide water for navigation.

### Already Put Into Practice.

The plan has already, in many instances, been put into complete practice in the west, where the waters of certain catchment basins are stored in mountain reservoirs and entirely utilized for irrigation. The streams in these valleys, instead of being, first raging torrents, and then dry beds, preserve an even flow during the entire time that the water is needed, and the flood excess is stored in the mountain basins. The only difference in considering the waters of western and eastern rivers is that the former are needed for irrigation and the latter for navigation.

The President has also mentioned the importance of the water power resources of the country,

citing the plan of Los Angeles for bringing water for city use a distance of nearly 250 miles, and incidentally developing power therefrom sufficiently valuable to probably pay large interest on an investment of \$23,000,000.

In connection with our water power resources, the data which have been gathered by the Hydrographic branch of the Geological Survey, through its extensive system of stream measurements or gaugings, is interesting and presents some startling facts.

#### **Vast Power Now Wasted.**

Chief Hydrographer Leighton calculates that there is a minimum of 1,600,000 horse power going to waste over government dams across navigable rivers alone. Considering this worth an annual

that they are practically one and the same. Even- ing up the stream flow, by reservoiring for one purpose would be equally effective in promoting the other.

The low water flow of any stream determines its capacity, either for power or for navigation, and the variation in the most of our rivers is surprising. Take for instance such a well known river as the Susquehanna. For several months each year its flow is around about 1,000 cubic feet per second, while in times of flood it frequently passes the 100,000 feet per second mark; in other words it flows in one day what it would otherwise discharge in three or four months. For power or navigation purposes, this excessive flow is worse than useless. And in the case of general floods along the various rivers which empty into the Mississippi and the Missouri, the aggregate swollen discharge of hundreds of such large rivers and of thousands of smaller streams is enormous.

#### **Great Value of Storage.**

The intelligent storage of these flood waters in a thousand natural reservoirs or lakes at the head waters, would reduce these floods to entire-

Enough Waste Water Passes Down this River Each Year to Make It Four Times Its Normal Size if the Flood Waters Were Dammed and Regulated.

rental of but \$20 per horse power, the nation should have a yearly income from it of \$32,000,000, or a 3 per cent investment on \$1,066,666,666. These large figures are somewhat unintelligible, but the great volume of this wasted resource may be realized when it is compared with the stupendous power which it is proposed to create from Niagara, with its 167 feet of sheer fall. The Niagara power projects, which it has been heralded far and wide would destroy the scenic beauty of the giant cataract, contemplate the development of some 340,000 horse power by using the American Falls and 430,000 horse power from the Canadian Falls—780,000 horse power—or less than half the wasted horse power above mentioned. And even this is but a slight portion of our nationally wasted water power. It can be found on every hand, in both the large rivers and the small streams and in the aggregate it runs up into the tens of millions.

This question of power development, especially in the upper reaches of streams, is so closely related to that of navigation on the lower rivers,

ly safe bounds, while at the same time a vast supply of stored water would result which would later be let down into the various river channels to be converted into power and to maintain navigable stream flows.

The erosion and waste of good soil by reason of deforestation and lack of storage is another evil of large proportions; but one which can be remedied. This washing away of farm fertility is, as the President says, greater than all the other land taxes borne by the farmer. The Mississippi alone sweeps away thousands of acres annually of its richest delta lands, the value of this mortgage running into the millions of dollars. But the Mississippi lands are not the only ones depleted by flood. Some of the silt carried by the Father of Waters comes from the crests of the Alleghanies, augmented by the wash from every farm in the great Mississippi Valley and its tributary valleys. Director Newell, of the Reclamation Service estimates that each year a volume of earth, represented by

one square mile, 400 feet in depth is thrown into the Mississippi River.

#### Improvements Worth Hundreds of Millions.

As a nation we are undoubtedly rapidly nearing a position where despite the great cost of such a work as outlined, it will be determined the part of wisdom to undertake it. The expense would be heavy, but the benefits would be disproportionately greater. Floods are destructive and expensive, and their abolishment would increase property values hundreds of millions of dollars; the wasted power due to lack of stream control is a loss annually of hundreds of millions, while the lack of water trans-

The Thousands of Tiny Mountain Streams Carry Enough Water to Irrigate an Entire State if the Flood Waters Were Utilized.

portation which we should have is actually costing the people every year hundreds of millions more. It is not to be doubted that the benefits which would result under these three heads would be of far greater value than the amount of the expenditure necessary to make them possible. In other words, our economists and engineers are looking toward the day when our rivers shall become as certainly and *effectively managed as is the water in the distribution pipes of a modern city*. It is the highest conception of a stream's management that it shall result in flood control, in aid to navigation, in irrigation and municipal water supply where needed, and in development of water power; and in descending from its source to perform these various duties, it can be made, incidentally as it were, to accomplish the last named.

#### Preliminary Work Already Started.

The Hydrographic Branch of the Geological Survey has kept well abreast of the times in making its thousands and tens of thousands of stream measurements. Its records show quite definitely the maximum, minimum and average flows of our principal rivers and many of the smaller ones, and it has made reconnaissances and surveys of numerous reservoir sites in all parts of the country. Stream flow data is the first essential—records for

long time-periods of years—before any safe engineering projects can be undertaken with reference to river control. Without the hydrographic studies and records during the last 15 years in the west, not a single one of the government irrigation storage works could have been constructed to-day. A single year's measurements will not suffice in considering a stream's storage supply, or the depth of channel required for its greatest flow, since one year's flow may be double that of the next. Where reservoirs are to be built to hold water, either for irrigation or navigation, the average inflow must be known before capital can be safely invested, either the money for construction, or following, that of the homesteader, or the electrical power company, or that necessary to build and equip a line of boats.

While an immense work has already been done by the Hydrographic Service, with the President's characteristically expressed interest in this broad subject, it is probable that the activities of the stream measurers will receive a new impetus, since before it is possible to control rivers, it will be necessary to know them—to study their flows, their capacities, their habits, even their eccentricities.

#### THE TEMPLE.

RICHARD BRAUNSTEIN.

In some old legend of the vanished past,  
Some half-forgotten story,  
Some tale of Rome, the mistress of the world,  
Or Athens' primal glory,  
We read of those who, in their fullest life,  
Faded from mortal vision;  
The grand old heroes of the early time,  
Who walk the fields Elysian.

They dwelt with men on earth, and then were not;  
But in some temple splendid,  
Their statues stand, a calm majestic throng,  
By white-robed priests attended.  
And so I thought our friendships fast and firm  
No chance nor change could sever,  
Suddenly vanish from our longing eyes,  
And disappear forever.

It may be they are walking with the gods,  
O'er meadows ever vernal,  
Or, set as constellations in the skies,  
Light up the heavens eternal.  
But we, left desolate, can only carve  
From tenderest recollections,  
A pure white statue in our hearts of hearts,  
Incensed with sweet affections.

Their priestly thoughts pace reverent to and fro,  
Before the altar holy,  
While from the shrine, the fragrant dusty clouds  
Rise solemnly and slowly.  
And when the toil and busy day is o'er,  
And memory opes her portals  
We glide within the silent Temple's door,  
And dwell with the immortals.

## The Country Boy in the City

J. A. Garber

A NUMBER of years ago it was said that "everybody is moving to town." The migration is still in that direction. This is especially true of the young men and women. Boys and girls whose ancestors for generations back have lived on the farm or in the village, independent and respected citizens of the community, are not satisfied with the old environment, and so they seek employment in the city. In many rural sections there are scarcely enough grown-up young people left to organize a good debating society or singing school.

By many, this moving to the city has been deplored; but there are two sides to the question and our conclusions must depend largely upon our point of view. That the city needs the country boys is evidenced by the fact, that the majority of the best business and professional men were once country boys. So, also, the most of our great statesmen, in our past history as well as at the present time, have been, and, are men who have lived very close to the soil. It is not too much to say that they are the bone and sinew of the business, industrial, professional, and governmental world; and if the cause of freedom and our benign institutions are to be perpetuated, it will be because the young people from the rural districts emulate in their lives the teaching and example of their forefathers.

On the other hand, are the country districts suffering loss because the boys do not remain in the old home neighborhoods? Yes, perhaps, temporarily at least; but ultimately the country place will be a large gainer, for the tide must certainly turn sooner or later. The young men and women who are now hurrying off to the cities will live to see their children and grandchildren just as eager to get back to the farm, and when they go back they will take a great many of the city conveniences and home comforts with them. And then every easily accessible neighborhood in the country will be virtually a suburb of the nearest city or large town. With the free delivery of mails bringing the daily papers to the very doors; the telephone connecting every house with every other in the community; the electric car lines running out in every direction from the large centers to the smaller towns; with the houses built to include a few more modern conveniences and home comforts; when, a generation or so hence, the tide of migration is back to the farm, we will have there the principal conveniences of the city, with all the advantages of life in the country. At any rate, let us not be disturbed because the boys are going off to the city now. It would be a great deal better, no doubt, in many cases, if they stayed at home,

but let us hope that we will be fully repaid when they or their children and grandchildren come back.

One of the principal things which causes the country boy to grow restless and leave home to try his fortunes in the city, is the vision of fat positions which he fancies are there standing wide open just waiting for some one to come and step into them. This delusion is generally dispelled soon after the young man reaches town, but the lesson is sometimes severe, and needless discouragements might frequently have been avoided had he been informed beforehand as to the actual conditions. Speaking generally, the boy who goes to the city should be fitted for some special line of work, and have his plans very definitely laid out. This is an age of specialties, and there are always opportunities for the man who knows, the man who can do some one thing particularly well, who excels in his line. Business and professional men have not much time or inclination in our day to teach a new employé. They say they are not running a kindergarten; they want boys and young men who have been taught before coming to them.

Then along with the ability to excel in some particular line of work, the young man who goes to the city needs a large measure of pluck and energy. He will find that for every position that opens there are at least forty applicants, and if he can expect to get one he must go after it with a vengeance. I recall just now the case of a young man who came to Washington some thirteen years ago hoping to find employment. It was in the year 1894, just after the bottom had dropped out of the business world, and one-half the people were without employment. Coxey's army of unemployed men had made their memorable march to the national capital, and some straggling members of that unique company were still to be seen on the streets of the city. The prospects were anything but encouraging as the young man began to look around for a place. He had a good English education, and was an expert stenographer; and what he lacked in experience he made up in energy and determination. He placed himself in touch with business friends who had facilities for learning of any openings which might arise, and in a few days he received a message stating that the managing editor of one of the Washington dailies wanted a private secretary, and to call to see him at 4:30 in the evening. The message was received at 10 o'clock in the morning, and at 10:20 the young man was in the managing editor's office making application for the position. He got it, entered upon his duties immediately, and had the satisfaction of in-

forming a great many applicants who came that afternoon, and during the next four or five days, that the place had been filled.

The first six months of a young man's stay in the city is very likely to determine what kind of a life he will lead thereafter. It is the time when he is forming acquaintances and choosing his associates, and the company he keeps will exert a greater influence in the formation of his character and upon his ultimate success than any other factor that enters into his life. This applies not only to his business connections, but with even more force to his diversions, his habits and companions while off duty, during his hours of recreation. Let no young man who goes to the city to seek his fortune conclude, because he is only one in a multitude, that therefore his influence will be lost and he need not be very particular about his principles and habits of life. Nowhere in the wide world are truth and honesty and genuine manhood more appreciated and more needed than in the large cities. But the conflict is severe and unceasing, and the young man needs all the strength and power of resistance he can command in order to meet successfully the keen competition and the temptations which are certain to cross his path.

The story is told of Henry Wilson (that is not his real name) who came to the city and obtained employment in a large wholesale grocery. The business prospered and the proprietor enlarged the scope of his enterprise from time to time by adding new departments. Finally he concluded to add a department for the sale of wines and liquors, and to place Henry in charge of that branch of the business. When the plan was laid before the young man, he said simply, "I am sorry to disappoint you, sir, but I cannot take charge of that part of your business." "Why not?" asked the proprietor. "Because I do not believe in the sale of intoxicating liquors, and therefore must refuse to have anything to do with it." "Very well," replied the proprietor, "it will mean the sacrifice of your place in this store." And so the young man was discharged. A few months afterwards a new bank was to be opened, the largest institution of the kind in the city, and the president came to the wholesale grocer and asked him if he knew of any one who would make a good cashier for his bank. "Yes," said he without a moment's hesitation, "I know of a young man who will suit you exactly;" and he told him that Henry Wilson was the best man in the city for the position. "What do you know about him?" inquired the banker. "Well, all I know about him is that he would lose his job rather than do what he thought was wrong." Henry was given the place at double his old salary, and the man who secured it for him was he who, for the sake of preserving discipline, had discharged him from his own store.

The boy who goes to the city, even as a stranger,

will have no difficulty in placing himself in the right kind of environment, for there are a number of institutions which exist largely for the purpose of helping young people to maintain their integrity and develop into strong, useful citizens. In most cities there are schools of all grades where studies in almost any line of work may be pursued at night, thus affording opportunity to those who are employed during the day to fit themselves for more efficient work in their chosen field, or to prepare for a professional career. The Young Men's Christian Association has a welcome for all young men who come, and endeavors to assist them in every possible way by maintaining evening classes in various lines of practical work, a well-equipped gymnasium, studies and lectures in Bible and Sunday-school work, as well as giving some attention to the social side of life. There are also the public libraries and reading rooms, where evenings may be spent most pleasantly and profitably with the best books and periodicals. And most important of all, the young man should at once locate the church of his choice, where he will want to become a regular attendant and associate himself intimately with the people whose aims are apt to be right, and whose ideals are for the best things in life.

*Washington, D. C.*

#### A COSTLY CANAL.

The Panama Canal is by no means the most costly per mile of the great canals of the world. It may cost \$300,000,000 or even \$500,000,000, and still not be nearly as costly per mile as the great canal projected from the Danube at Vienna to the Adriatic at Trieste—at a cost estimated up to \$300,000,000—which will have twenty-two tunnels of a combined length of six miles. Large canal tunnels are not uncommon in Europe, however. A single tunnel on the Marne-Saone canal is nearly three miles long and over 700 square feet in section, and a tunnel on a canal at Condes is about 1,000 feet long and over 1,100 square feet in section. It is even yet an open question whether a tunnel in the Panama Canal through Culebra Hill would not be much cheaper than to excavate to such a great depth as they are now doing. The open cut, however, has some compensating advantages.

#### NATURE AND SCIENCE.

The new coast lighting service proposed to the Kiel Nautical Society by Corvette Captain Arenhold, a retired German officer, is designed to make unnecessary the present expensive light houses. Naval searchlight signals, projected at an angle of forty-five degrees, are visible at a distance of fifty nautical miles; and he believes that a cone of light reflected perpendicularly upward could be seen at least eighty nautical miles—much further than the more powerful horizontal pencil of light from a tower sixty-five to one hundred feet high. The different beacons could be made recognizable by different colors and different forms for the light sheaf.

WEAK men wait for opportunities, strong men make them.—*Marden.*

## A Future for the Buffalo

A YEAR or two ago an association called the American Bison Society was organized to save the buffalo from extinction. The society has aroused interest in the matter and has had the good fortune to see two government herds established within a year. One was presented to the United States

mon method was for a few dozen horsemen to watch a large herd of buffaloes for several days, from a distance, but draw in closer each day so as to gently force the herd toward some ravine or precipice. When the herd was headed right, and the distance to the trap close enough, these brave?

hunters, by noise and shooting and rapid approach from behind, would start a stampede of the entire herd. Surprised by this sudden foe, the buffalo would plunge forward toward the ravine or precipice, and after a herd of ten or fifty thousand had once started to running, there was nothing left for those in the lead but to jump the precipice and be crushed to death either by the

Indians Welcoming their Old Companions Back Home.

government by the New York Zoological Society and sent to the Wichita forest and game preserve in Oklahoma. The other was purchased by the Canadian government from the Pablo herd in Montana and is now established in the Elk Park in the foothills of the Canadian Rockies.

Thus after a generation of painful indifference a few people aroused themselves sufficiently to see that the once venerable buffalo shall not be blotted off of the face of the earth by the ruthless hand of sporty Americans.

Nothing in modern time equals the useless slaying of the buffalo, either in magnitude or cruelty, and it is to be hoped that from these two herds a new start may be made of this interesting specimen of the animal world.

That the younger generation may know something of the cruelty which man is capable of, we will describe some of the methods by which a few of the old hunters used to trap tens of thousands of buffaloes. One com-

mon method was for a few dozen horsemen to watch a large herd of buffaloes for several days, from a distance, but draw in closer each day so as to gently force the herd toward some ravine or precipice. When the herd was headed right, and the distance to the trap close enough, these brave?

Cases have been told where the entire valley of small streams were leveled up with dead buffaloes so that the few remaining ones could cross to freedom on the level.

The gang of hunters would then spend a week or more in skinning the largest and best carcasses.

Loading Buffalo.

When they tired of their job, or acquired all the hides they could market, they left the corrupt mass of flesh to the Indians, the hungry wolves, and time to devour.

Another method was that of covering ponies with buffalo hides and riding in among a herd and shooting or spearing until satisfied. Sportsmen often got railroad conductors to stop a train and let them have one hour in shooting dozens of buffaloes, which might be grazing near the railroad. These were shot for sport and left to rot without ever being touched.

Thus by one foul means after another the white man exterminated millions of buffaloes within a few years' time. When the settlers went to Kansas in the early eighties, the central part of the State was one vast buffalo graveyard. So numerous were the skeletons out on the open prairies that, in some places, a ton of bones could often be gathered into a wagon without moving it out of its tracks.

It is but just to say that the Indian did not engage in this wasteful and useless warfare against the harmless buffalo to such an extent as did the white man.

The useless destruction of harmless animals at any time ought to be prohibited, because it breeds coarseness and hard-heartedness in the slayer.

The seal is on the verge of being exterminated now in the effort to satisfy the foolish desire of some rich people, who want to pay a little more for their dress than some other people do. Song birds were protected by statute a few years ago in the United States or else some species of birds would have been annihilated to adorn (?) woman's head-dress. Several South American nations have forbidden French and American bird hunters from gathering fanciful feathers from tropical birds to be placed on the millinery markets of Paris and New York.

The moving of the herd of buffaloes from New York, and their reception en route and by the Indians in Oklahoma, is told by Mr. Loring, the gentleman who has secured for the few remaining buffaloes their ancient rights:

The work of rounding up the herd was commenced in October. A chute, fifty feet in length, had been erected between the two main corrals fronting the Buffalo House, communicating with both and terminating with a very ingenious sliding iron gate. Against this gate the crates were placed. The herd of fifteen was driven into the north corral, and the animals, one at a time, liberated into the chute. As soon as each bison was selected, the properly marked crate, designated for this particular specimen, was fastened into position adjacent to the sliding door. Most of the animals were rushed down and into the crate before they could realize it.

As nearly all of the western papers had described the bison transfer, our arrival at the various towns south of St. Louis was awaited with considerable

interest, and in some places it approached enthusiasm. As the side doors would be opened throngs of men, women and children rushed up to get a glimpse of the famous animals, and if the stop was long enough, they climbed in, and inspected the bison through the openings of the crates. In some places the car was packed to suffocation, and the people only departed when they were forced out by the speed of the train. The signs attracted attention everywhere and the curious observers noted them all along the line, reading as long as the car remained in sight.

The eastern boundary of the Bison Range crosses the end of the valley at Lawton, Oklahoma, and five miles beyond are the corrals, where the bison arrived after seven days car riding. The wagons were driven in and the rear wheels dropped into depressions dug in the ground. After spraying the animals with crude oil, each was liberated. Aside from a very slight lameness, they were in perfect condition, greedily eating their allotment of hay. The corrals, three in number, each about 200 feet square, are placed just inside the southern boundary of the line fence, separated from it by a passage of 15 feet in width. Two long sheds with mangers have been erected on the northern side. Individual members of the herd may be quickly transferred from one corral to the next, through the lane on the south side, the ends of which can be closed with strong wire gates. The fence is 74 inches high, made by the Denton Wire Fence Company, of Denton, Texas, supported on oak posts twelve inches in diameter, set three feet in the ground. Above the fence proper, for greater security, are three wires extending parallel to the line of the top, about five inches apart. One of these will be insulated for a telephone service, which is being installed. The gates are most ingenious, handsomely constructed, and can resist the rush of a big bull as easy as the fence itself. The grass in the corrals has been burned off, and the animal can get no other food but the alfalfa upon which they are now feeding almost exclusively. Large galvanized tanks, of the type used exclusively in the west, have been placed in each enclosure, and a constant supply of running water will flow into each as soon as the windmill on the banks of Cache Creek has been completed.

The bison will be kept in the corrals until spring, when Mr. Rush expects to liberate them into a range of some 200 acres. This pasture will be fenced in the winter and the grass burned. A number of cattle graze through the valley, and as it is quite well known that they carry the tick which causes Texas fever, the spraying with oil and burning of the grass have been thought expedient to prevent the bison from becoming infected. Mr.

Rush is thoroughly familiar with all methods of prevention, and has adopted the most stringent measures to carry the animals through the dangerous season. Once they become acclimated, the danger line will be passed.

The fence is nearly fifteen miles around, and encloses 6,200 acres of the best of the valley and the mountains on the western side. Four rangers will police the range at all hours, and the dangers from forest fires and breaks in the wires can be detected and reported with dispatch, as telephone boxes will be placed at each of the five range gates. Mr. Rush gives his entire time to the bison, and Mr. W. R. Mattoon, Acting Forest Supervisor, is in charge of the construction and working of the station.

## CURRENT COMMENTS

### AFTER WHISKY, THEN WHAT? OPIUM.

Chinese are known the world over as opium fiends. They fought, at first, to resist the use of the drug, but the big bully, England, forced China to slay her children on the battlefield in a brave defense of her national virtues and then to slay succeeding generations by the continued use of opium.

England was sane enough to know it was wrong when she did this and has lived long enough since to repent of her wrong which can only be lamented now—it can never be cured or made right.

With such a dreadful chapter within the lives of people now living it would seem impossible, or at least a mad act, for the United States to duplicate that folly. But as strange and as insane as it seems to be, it remains true just the same that we are headed in that direction. The Department of Agriculture has been experimenting in Southern Texas with the poppy plant with the view of producing opium on a large scale for the people of the United States to use.

The matter is yet in its infancy and seems like a toy to be played with so far, but as sure as the plant becomes acclimated and the cultivation of the plant proves a financial success opium will come into general use and the government will reap a rich revenue from it just the same as it does now from the saloons which seem to be doomed to extinction at an early date.

This movement ought to be nipped in the bud and never allowed to fasten its poisonous fangs in the heart of our sons and daughters. The saloon business has been a costly lesson to all classes, why fool with opium?

### ONE OPINION.

THE *Philadelphia North-American* (rep.) says: "The New York banks owe the banks of the country \$500,000,000. For a month they have refused arbitrarily to pay. They actually indulge in self-praise because they have consented, reluctantly and under pressure, to settle some sixteen per cent of that debt, largely with the government's money newly deposited with

them. We face now the indisputable fact that all gold importations, all the deposits of treasury money, all the questionable bond and debt certificate deals have been done for one solitary purpose—to put New York in a position to pay its debts. Let the humiliating admission be made frankly. All signs point to easier money. But whether or not those signs will be fulfilled depends upon the will of Wall Street. The country has paid a tremendous blackmail for permission to resume legitimate business. But no guarantee is gained that agriculture, commerce and industry will not be held to ransom again, and yet again, whenever it suits Wall Street's pleasure. Until our financial system is changed American business is at the mercy of Manhattan's gamblers."

### THE FINAL ACT IN MAKING NATIONAL LAWS.

National legislation is vested in Congress according to popular opinion. True, the bills are introduced there and threshed out pretty liberally by both the representatives and senators, and formulated into legal documents to be executed as needed.

After all the effort made by our four hundred national legislators, when one of their laws is tested and finally decided as to its rightness, fitness, and constitutionality, this is done by nine men—the Supreme Court of the U. S. Congress can pass all the laws they please and the Supreme Court can cancel all they please, providing they find grounds for such action. After all, then, Congress proposes laws. That is about all. Their nullity and verity depends upon the nine judges who sit on the supreme bench.

### TROUBLES IN THE TRANSVAAL.

If the English have a hard question to solve in regard to Japanese immigration into Canada on account of the Japanese alliance, they have a still harder question in the Transvaal in regard to Hindu immigration and regulation; for the Hindu are, equally with the Afrianders, subjects of the Empire, some of them having served in the British army, and that they should now be treated as inferiors is likely to make trouble in India. The Transvaal is anxious to prevent new Hindus from coming into the country, and to that end they registered the 13,000 Asiatics who were already within its borders before the Boer War. The certificates of registration included among the identifying marks the thumb impression of the man registered. In spite of this, the certificates were bought and sold freely, and identification became a farce. The fact that Natal, the neighbor of the Transvaal, does not object to the Hindu and allows them to come freely, so that there are now 120,000 Indians to 92,000 whites in that colony, made the difficulty a serious one. The Transvaal, like British Columbia, Australia and our own Pacific coast, is determined to keep the Asiatic from increasing in its borders. The first law which the Transvaal passed under its new constitution as a British colony was an immigration restriction bill, which gave the authorities the power to deport unregistered Asiatics, and the British government allowed the law to stand, although it was contrary to its former policy. In order to prevent the practical nullification of the registration system, the

Transvaal during the past year, made identification considerably stricter, and to that end compelled the Hindus to give the impression of ten fingers instead of one. Straightway a storm arose among the Hindus. They refused to register. Some of them had served in the British army, all of them were British subjects, and they would not thus be debased. The Transvaal authorities threw thirty-five of them into prison for short terms. The explanation of their refusal to register seems to be that in India the impression of the left thumb is accepted as a current means of identification, but only criminals who have undergone punishment are compelled to give the impression of ten fingers. The British government has unfortunately tied its hands by giving to the Transvaal the power to export Asiatics, and it is hard to see what it can do. The Transvaal itself gives no sign of yielding in the matter, tho its policy sows seeds of discontent in India, where the soil is already well prepared with ill feeling against England.

### LIQUOR TACTICS.

The Brewers' Association send out many leaflets, news items and prepared matter for the press that is wholly untrue. They do this in order to gain their point and to prove that more whisky is sold in prohibition territory than in license territory.

It takes some effort to run down these lies, but here is one that has recently been strung up for the public to look at for a while. It is a sample of the trickery and devilishness which pervades the entire saloon element:

One of the recent articles of the daily press contained the assertion that "2,583 persons are said to have federal licenses to sell liquor in Maine." This is nearly five times the actual number.

| Year   | R. L. D. | R. D. M. L. | W. L. D. | W. D. M. L. | Rectifier | Brewer | Total |
|--------|----------|-------------|----------|-------------|-----------|--------|-------|
| 1900-1 | 1148     | 289         | 19       | 30          | 2         | 5      | 1493  |
| 1901-2 | 1038     | 358         | 15       | 32          |           | 4      | 1447  |
| 1902-3 | 975      | 423         | 15       | 36          | 1         | 2      | 1452  |
| 1903-4 | 546      | 564         | 8        | 29          |           | 3      | 1159  |
| 1904-5 | 636      | 427         | 15       | 28          |           | 3      | 1109  |
| 1905-6 | 209      | 502         | 6        | 30          |           | 3      | 750   |
| 1906-7 | 307      | 467         | 2        | 28          | 1         | 5      | 810   |
| 1907-8 | 107      | 334         | 2        | 29          |           | 4      | 536   |

R. L. D.=Retail Liquor Dealer. R. D. M. L.=Retail Dealer Malt Liquor. W. L. D.=Wholesale Liquor Dealer. W. D. M. L.=Wholesale Dealer Malt Liquor.

There are many resorts where the liquor tax has been paid twice and even three times in the year by as many different persons, the proprietorship changing every few months which necessitates the issuing of a new tax receipt.

The four "brewers" make only non-intoxicating beer.

The two "wholesale liquor dealers" are wholesale druggists, and the "retail liquor dealers" include 15 town liquor agents not authorized to sell for beverage purposes.

Thus instead of there being 2,583 federal licenses in the state there are only 536.

### SNEAKING WHISKY INTO PROHIBITION TERRITORY.

One of the hard fights which the people in the six dry states like Kansas, or North Dakota, has to endure is the privilege which railroads take in carrying the liquor from a wet state into the dry state, where the law forbids the selling of liquor.

Bills are now pending in Congress which will put a

stop to such illegal traffic. At some of the division points and junctions of the large roads in Kansas, the express companies did a wholesale liquor business, so far as handling liquor packages were concerned.

Interstate commerce laws seek to regulate much other traffic between the states so as to comply with state regulations and now it is time for the people of a dry state to secure some legislation to keep whisky out of their territory.

The Littlefield Bill prohibiting the interstate commerce in intoxicating liquors in conflict with state laws provides that the police powers of the states shall attach to all liquors shipped into the state as soon as they cross the state line and that the place of sale is the place of delivery in case of C. O. D. shipments. Under the present interstate law and the interpretation placed upon it by the Supreme Court, liquor can be shipped into dry territory and the state officials cannot interfere with it till it reaches the point of destination and a delivery has been made. This greatly hampers Prohibition and local option.

Speaker Cannon is said to favor the continuation of the old way in allowing whisky to be shipped into and used in prohibition territory contrary to state laws.

### OTHER TEMPERANCE LEGISLATION.

Another important bill is the Liquor Tax Receipt Bill. There are now twenty-two of these bills pending before Congress. Most of them are not in shape to do what they are intended to do, but they are all intended to protect from Federal interference prohibition and dry territory.

The one bill that covers all points and the one which will be advocated is one presented by the Prohibition Congressional representatives and known as the Hill Bill having been introduced by Congressman Hill of Connecticut.

This bill provides that no liquor tax receipt shall be issued to any one until the applicant therefore has produced a state, county or municipal license.

This will effectually stop blind tigers whether in license local option or prohibition territory since no one can get the Federal permit without first having the local license.

### THE PLOT TO RESTORE THE CANTEEN.

Word has just come to some of the reform leaders in Washington that military officers are making a very active propaganda for the restoration of the beer saloons in the army. It is reported by an army officer, in confidence, that General Grant and General Geo. B. Lowd have formed in New York a society called the Army Canteen Association. Gen. John A. Johnson has a long article in the Pittsburg Dispatch, recommending the restoration of the army beer saloon as a means of grace.

This political propaganda, it is claimed, is in violation of Army Regulations, 1904, Paragraph 5, which reads: "Efforts to influence legislation affecting the army should never be made except through military channels. The adoption of any other method by any officer or enlisted man will be noted in the military record of those concerned." Probably these officers have little to fear for the War Department, charged with the duty of enforcing the Anti-Canteen law, has been actively at work for its restoration from the time the law was passed. Every temperance man, whether he regards the effort to restore the canteen as likely to succeed or not, should see that the sophistries on this subject are answered and that the opportunity this discussion affords to present the truth about beer is utilized.

# THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## THE INGLENOOK AND POLITICS.

It is easy to get married to a party and blindly endorse anything and everything which that party does, and at the same time condemn all other measures offered by opponents and rivals. While this rule holds good, more or less, in all organizations, it seems to hold doubly good in politics.

The time will soon be here when presidential candidates will become very prominent, and partisanship will run very high. Since this is true, and knowing the delicate feeling which some voters have about their favorite candidate, we want to forestall any and all chances for this feeling to spread its slime over the pages of our magazine.

It is all foolishness to think that any one candidate has a monopoly on either ability or virtue. There will not be a man nominated by any party but what possesses some of the good qualities needed by a national executive officer, and the simple fact that he endorses the Republican, Democrat or Socialist platform is no indication at all that he can govern 90,000,000 people well. President Tyler was a staunch partisan, but a very poor ruler in the White House, while President Monroe was a very neutral man, at least conservative, yet he was almost an ideal ruler.

The policy of the INGLENOOK shall be to approve and commend the good character and sane politics of each and every candidate. When the Socialists propose a new and reasonable idea worthy our mention, we shall not hesitate to give it publicity, and when the Republicans show weakness we shall not hide their shame. At all times we shall gladly note any moral propositions which any party puts forth, altho outside of the Prohibition party there are not many direct moral issues advocated.

In conclusion we want to discourage the sending of partisan notes to the Editor with the hope or request that he will publish them. Our magazine is independent and shall not purposely allow ourselves to be drawn

into any faction, political or otherwise. Our aim is material and spiritual progress. Our matter, educational, scientific, economic, financial, philanthropic, and religious. Politics, so far as affected by partisanship, are purposely omitted, altho movements affecting civic life will appear in our columns week after week.

## THE SECOND AND LAST CALL.

FOUR months ago we called for articles favoring international arbitration. We received *one* response.

Are we a family of whisperers, backbiters, slanderers and cannot conscientiously write anything in favor of peace? No. We guess that each one thot that the other fellow would write. But the other fellow didn't write. If we receive nothing from this call there will be a tardy mark at least placed against the names of some of our moralists and educators. Can you teach Latin, mathematics, and the sciences and are not able to teach peace? Better revise your course of study so as to incorporate some studies that enter deeper into soul-life than does Latin and science. May we have a hearty response of well-prepared articles from our contributors. We do not want to prove peace from a Bible standpoint, nor from a church decision, but we want war itself to be its best witness against itself, and peace to be its own advocate. The reasonableness and unreasonableness of the question is what we want. Christ had a reason for all of his doctrines. Let us find his view point of life.

## A CHANGE IN OUR NEWS.

WE have been requested to give an account of accidents in our news items, and henceforth will include the leading accidents of each week, altho we do not consider such news as very essential. Twenty-four pages of the INGLENOOK could be filled each week with nothing but accidents that occur in a city like Chicago.

If we speak about the suicide of one man we also ought to speak about the 200 other suicides each week in the United States. If we tell about any one murder we ought to tell about all the other hundred murders. If we speak of one automobile accident we ought to speak about all the other hundreds of such accidents each week. Then there are scandal cases. Dozens of them right at our door, Chicago, every week. Then there are the gambling raids, betting at horse-races, saloon happenings, fights, murders, disgrace. But we shall let your daily paper feast you on all such rich stuff, while we will give a different grade of accidents. Perhaps if we should give the kind of news indicated above some would quit taking their daily altogether and take only the INGLENOOK. Or what grade of news is it in the daily paper that makes it so essential to your home? The INGLENOOK gives all the news *except the rotten slush and scum of sin*. We leave that for you to get out of the daily paper.

## OUR INGLENOOK.

RICHARD SEIDEL.

We welcome 'thee with message clear,  
Thru every week, thruout the year,  
Thy words bring to us hope and cheer,  
Our Inglenook.

Tho conflicts rage and strifes increase,  
Who advocates the reign of peace,  
And seeks from sin, souls to release?  
Our Inglenook.

Who shows "the way, the truth, the light,"  
Declares, "My servants do not fight,"  
Condemns the rule that "might makes right?"  
Our Inglenook.

Our pure bright harbinger of love,  
That bears the spirit of the dove,  
Thy blessed truths our hearts approve,  
Loved Inglenook.

## DRY READING.

WHAT do you read for? For pleasure, to learn, or to kill time? Reading matter which merely excites the sensibilities, but neither feeds the intellect nor strengthens the will is hurtful in more ways than one. First, it creates an appetite for more matter of an exciting kind, and then soon calls for more excitement. More and more, stronger and stronger, is the call for such stuff until the mind becomes abnormal and is governed by the emotional and beastly part of man. The highest pitch and last stage of such growth is tragedy in which the reader of such literature becomes the actor. Tragedy to body and soul.

Many a murderer has confessed that his mind had been inflamed to commit his crime by the reading of criminal literature.

The second hurtful thing about foul literature is, that it destroys all appreciation for sane and helpful reading. Everything else is flat and dry unless it is colored up with human blood, and seasoned with profane words or scenes.

Can you become interested in any kind of literature, such as poetry, history, descriptive, technical, scientific and so on? If the matter is written in an easy style and it is repulsive to you, rest assured that you have attained to an abnormal condition of mind. A healthy physical appetite relishes any of the various kinds of foods, starch, sugar, proteids, etc., while a healthy mind feasts also on a variety of information and ethical thot. Of course there are preferences but when in health the mind will not sicken at every little food outside of its own choosing.

We often see people spend hours, yes days, and weeks, devouring a book. Odd moments at all hours of the day are snatched up in order to follow the thread of the story. And the whole thing could be told in a few pages. It was all about a romantic love affair. A chance acquaintance, courtship, rivalry, a quarrel, a spooning season, a fall-out, separation, an accidental renewal of love, the wedding. Tragedy often figures

in the story some place, a suicide, a duel, or something weird, unnatural and unreal.

When we ask these people to read something that calls for *conviction and execution of purpose* they say, Oh, such dry reading. I just can't interest myself! The man who drinks whisky wants his eatables all peppered and salted, or else he cannot taste them. His taste has been paralyzed with strong drink, and the person who reads much excitable matter will soon call for something snappish and fiery. Their normal taste for pure literature is gone. Then things do get dry and prosy.

With as much earnestness as we would beseech you to quit drinking whisky or playing with a rattlesnake, we beseech you to quit reading questionable literature today, if you can, for mark the appeal, a drunken, weakened mind, incapable of executing a decision, comes just as surely from reading sensational literature as it does from drinking rum. Foul literature is the ally of whisky.

## SPECIAL NOTICE.

OVER 1,000,000 people are studying Esperanto, the new world-language. The INGLENOOK will teach you this language free of cost. None too young, none too old to learn it. Go to organizing a class at once and tell us how many of your friends want a six months' course of study free. All that is required will be to subscribe for the INGLENOOK, and get the regular text book. The book costs \$1. If sufficient numbers want this new language we will begin at once to give lessons. There is no time for delay. See an account of the language elsewhere in this issue.

## OUR NEEDS PLUS OUR DESIRES.

THE difference between what a person needs and what he desires gauges the amount of happiness and sorrow that will be measured out to each person. You may have all you need, but because some one else whom you know has something additional, then you desire that also, so that what good things you have already are entirely lost in the inordinate desire to have as much, or more than the other person. Your clothes are good enough, but your neighbor has a new outfit and there is no rest until you have one also, altho your strength and pocketbook both argue otherwise.

If people could once become wise enough to enjoy their present stock of good things and not become feverish for what they do not have, it would add a great deal of happiness and usefulness to the present supply of contentment in the world. Needs are supplied daily, but desires for more and better and as much as others have, puts a person in a racking, unhappy condition. Desire only what you need, and then be content and thankful when that is obtained.

## FOOD PRINCIPLES

LENNA FRANCES COOPER, Principal School of Health and Household Economy, Battle Creek Sanitarium

### Mineral Matter.

IN our last article we considered the Food Principles. It is our purpose in this article to begin a study of them individually.

Of the two incombustible Food Principles, water has been discussed somewhat at length. But of the other, the mineral matter, let us now consider.

If we were to reduce any article of food to dryness and then incinerate it, we should find remaining in the dish something which we cannot burn. This we call *ashes* and is the *mineral matter*. But you may say, "It is so small in quantity. Of what consequence can it be?" True, it is a very small amount, but it is nevertheless a very important factor in our food. Without these mineral salts we cannot preserve health. They are absolutely necessary to keep the blood in proper condition, to enter into the composition of nerve tissue, and the bones strong and firm.

The classes of foods in which these are especially abundant are the vegetables, fruits, and cereals; the vegetables being the richest in this constituent.

Indeed vegetables are valuable as a source of mineral salts and for bulk which, by many physiologists, is considered very necessary.

The bulk is due to cellulose which forms the framework of all vegetable products, and which is practically indigestible, tho the tender cellulose of young plants is now considered digestible.

There are two classes of vegetables: viz., those which are storehouses of nourishment for young plants, such as the potato, peas, beans, etc., and the succulent vegetable such as lettuce, cucumbers, etc. The latter class are very low in nutritive value, tho they are not to be despised since they are very rich in mineral salts. Of the eight parts of solid matter in lettuce 1.24 parts are mineral matter, making the mineral matter about  $\frac{1}{5}$  of the total solids. Of 12 parts of solid matter in spinach 1.98 parts are mineral matter, making  $\frac{1}{6}$  of the totals solids.

While the nutritive value of these vegetables is low, it is made even lower by the ordinary methods of cooking. When vegetables are cooked in large quan-

ties of water and the water drained off, a *good share of the valuable part of the vegetable is thrown away.*

The best way to cook vegetables is to steam them, or cook in as small a quantity of water as possible and to make a sauce of the liquid that remains. Oftentimes the liquid in which vegetables are cooked may be utilized the next day as a vegetable stock for a soup or sauce.

As far as possible let lettuce, celery, fresh tomatoes or some fresh vegetables, or fruit, appear in the daily menu. There is undoubtedly a value in fresh vegetables and fruits, that is not found in the cooked. But let it be remembered that all vegetables with a coarse fibre such as carrots, turnips, etc., and those containing starch should be cooked, both to soften the cellulose and to cook the starch.

All strongly flavored vegetables such as onions, carrots, turnips, cabbage, etc., should be cooked in boiling salted water, uncovered. All vegetables should go to the fire in boiling water.

### RECIPES.

#### Spinach Souffle.

1 cup spinach puree.  
1 cup milk.  
 $\frac{1}{4}$  cup flour.  
3 eggs.  
2 tablespoons of butter.  
 $\frac{1}{2}$  teaspoon of salt.

Rub the flour, butter, and salt together, heat the milk and add slowly to the above, stirring to keep it smooth. Then add the spinach puree by putting canned or freshly cooked spinach through a colander. Then add the yolks of the eggs beaten till light, and lemon colored. Lastly fold in the stiffly beaten egg whites. Turn into a baking dish and bake in a slow oven 15-20 minutes.

#### Onions on Toast.

Cook medium-sized white onions in boiling salted water until tender. When tender thruout arrange on nicely toasted slices of bread, and pour on each onion a little cream sauce as follows: Put one pint of rich milk or thin cream to heat in a double-boiler. Thicken with one-fourth cup of flour moisten with a little cold milk. Cook 15-20 minutes. Add salt.

Garnish each plate with two or three slices of hard-boiled egg.

#### Escalloped Vegetable Oysters.

1 quart sliced salsify.  
1 pint bread crumbs.  
1 pint cream.  
1 pint liquid in which the salsify is cooked.  
 $\frac{1}{4}$  cup of flour.  
 $\frac{1}{2}$  teaspoon salt.

Cook the vegetable oysters in boiling salted water. Drain and save the liquid. Make a sauce of the cream and liquid, thickening it with the flour and cook in a double-boiler as the cream sauce for the onions. Add the salt. Arrange the vegetable oysters and the bread crumbs in layers in a pan, the top layer being of bread crumbs. Over all pour the cream sauce. Bake about  $\frac{1}{2}$  hour.

#### THE WORTH OF A GOOD COOK.

THIS side of the question will be written by a man, leaving the questions of good providers and sour husbands to be discussed by the opposite side of the house.

No man on earth will be satisfied with a poor cook. Do you hear that, young girls, and mothers? The divorce may be granted on the grounds of cruelty but the first root and branch of that cruelty was dissatisfaction about some personal need not attended to. Fine piano music by the wife in the parlor will not make full what is lacking for the husband in the diningroom; nor will a loose, witty tongue of a society belle change the food flavor on the palate of a hard working man; nor sweet looks stop the gnawings of an unsatisfied hunger in a man's stomach. Indeed to have the three substitutes named above and yet be unable to feed a hungry husband shows the folly of some modern home-training which young girls receive these days.

Hired servants and a liberal use of prepared foods can never reach the fatal spot of a husband's appetite with such satisfying effect as can food that has been prepared and flavored with the sweet will of a cheerful and confiding wife—one who seeks to please her husband.

If you ever intend to marry, young lady, make sure that you win your husband by nook or crook, or die in the effort. There is no joy in wedlock when this effort is not mutual. Now they say that the most direct route to a man's heart is thru his stomach. Be sure that you learn this road then early in life and travel it in wedlock.

#### What Is a Good Cook?

1. One that takes interest in the culinary department of her home. She will not be satisfied with greasy dishes piled up here and there; with scraps and foul matter in sight of the dining table. She tries this way, that way, and the other way. She studies foods

more than she studies fashion plates and display windows at millinery stores.

2. One who teases both the appetite and affection of her husband. Warm-hearted, wives and cooks who are hopeful, confiding, and alway making the man wish that he could get even with her kindness rather than to be outdoing them all the time.

' Lord give us more good cooks!

#### FROM AN ORPHAN GIRL.

Burroak, Kans., Jan. 28, 1908.

Editor Inglenook, Elgin, Ill.

Dear Sir: As you are interested in the orphan I thot I would like to let you know what a nice home I have. I came to Mr. Chas. Sloniker's a little over four years ago, a girl then of ten years, with no home, and in that time I have attended school every day during the school year. I go to Sunday school and church every Sunday.

The people with whom I came to live, belong to the Brethren church. Up to that time I never knew of such a church, but after I attended their church for a time and these people were so good to me I wanted to unite with their church. So two years ago last fall, at their love feast, I united with the church.

I could not be treated better in any home than I am here. I have everything to make me comfortable, a good chance to get an education, and have good church privileges. I wish every orphan had a good home like mine.

Your little friend,

Edna Mosher.

WHILE this little girl is happy now, she will see the worth of a good Christian home more after she gets older. The family who so kindly befriended this orphan girl will never regret their good deed. There are thousands of good people with good homes, and no children, who could make other orphans happy as did Mr. Sloniker. The Editor knows something of this girl's home. Why not take an orphan brother and sister into your home, you who are able, so that they need not be separated? Can we hear from more orphan children, or those who were once orphans but are now settled down in life now?—*Editor*.

#### QUESTIONS ON POULTRY.

1. WHAT breed of fowls do you find the best layers?
2. How many hens do I want for each male?
3. How many fowls is it advisable to keep in one yard?
4. Is it preferable to have a board floor or one of earth?
5. What do you consider the best incubator?
6. What capacity incubator do you consider the most practical?
7. Are most vegetables good for poultry? What kinds are particularly good?
8. What do you find the best remedy for lice?

#### ANSWERS.

1. If you have a large yard for your chickens the leghorns are unexcelled, but if you have a small yard

the plymouth rock will likely give better results. Some breeds bear confinement better than others.

2. From eight to ten. Eight is preferable.

3. That depends entirely upon the size of the yard. With fresh soil, plenty of greens, wood ashes, and grit, chickens can be crowded. The roosting place must be clean and well ventilated.

4. Dirt floors. Keep clean by moving the house several times a year onto fresh soil.

5. They are all made nearly alike. What gives success to one is a dead failure to another.

6. For a beginner use a small incubator, or else you run a good chance of losing money by scalding your eggs. Experience and care is required in handling incubators with success. After one season's experience you might chance from 100 to 400 or 600. Do not get larger than that unless you have a regular house built for hatching. Better use two small ones, for if you make a mistake some day it may not affect both.

Fresh grasses, vegetables, fresh meat and bones are all necessary. Chickens must have mineral matter in abundance in order to form the egg shells. Vegetables, bones and prepared grit are all good.

8. Tobacco powder is good. So is a soap and kerosene emulsion. Take ordinary suds and make it one-third to one-half kerosene and sprinkle it on the fowls. Good wood ashes for the chickens to wallow in will destroy lice on their bodies. Whitewash the chicken house and soak the roosts with kerosene. This will destroy lice. Do not wait until your flock shows signs of lice before you begin. Keep their house clean if you want any profit in the poultry business.

Have you ever tried the milk albumen sold as a substitute for meat for poultry? If so, with what results?

Giving the hens warm water these cold mornings will help them to keep up the heat, and it is much cheaper than grain at present prices.

If your state experiment station is doing anything with poultry, get the bulletins recording their experiences. They ought to be helpful to you.

A good dry mash and one easy to remember is made from ten pounds each of best wheat-bran, corn-meal, ground oats, wheat-middlings, gluten-feed or meal, linseed-meal, and best beef-scrap.

#### HOW SOME PEOPLE TEACH COOKING.

BELOW we copy a lesson on cooking from some leading magazines. The INGLENOOK believes in plain English instead of the French terms used.

*Melon Sauce (sweet)*—Remove the rind and seeds from several slices of melon, then boil them in a liquid composed of two parts of wine to one of water, adding lemon-peel, cinnamon and cloves to taste. When soft, strain and serve.

*Melted Butter Sauce*—Melt four ounces of butter,

and shake into it gradually a tablespoonful and a half of sifted flour. Stir all the time. Add a teacupful and a half of cold water by spoonfuls, without ceasing to stir. When the mixture has commenced to boil, lift from the fire and stir until it thickens.

*Menus droits*—Suckling pig's ears when served as an entrée.

*Meringue*—Sugar and the white of egg, beaten to a froth.

*Meringues*—Light, spongy cakes, usually filled with whipped-cream.

*Merlan*—French for whiting (the fish).

*Merluche*—French for haddock.

*Meuniere (a la)*—In the miller's style.

*Mignon*—French for dainty, delicate.

*Mignonette Pepper*—A form of comminuted pepper, made from either white or black pepper-corns, which, after being broken to resemble mignonette seed, are sifted until all fine dust has been removed.

*Mijoter*—To cook slowly.

*Milanaise (a la)*—In the Milan style.

*Milanaise Garnish*—Chop six mushrooms, two truffles, and an equal quantity of smoked beef-tongue into small pieces, and put to cook with two cupfuls of previously boiled rice. Moisten with half a pint of Madeira sauce and the same quantity of tomato sauce; add three tablespoonfuls of grated Parmesan cheese, and season to taste with salt and pepper. Bring to a boil and cook about five minutes longer.

*Milanaise Sauce*—Melt two tablespoonfuls of butter in a saucepan, and add two chopped mushrooms, two boned anchovies, and a chopped truffle. Stir until brown; then sift in two tablespoonfuls of flour; stir for about four minutes, and add half a pint of beef-stock, half a wineglassful of Marsala wine, and the same quantity of caper vinegar. Stir until the mixture boils; then add mixed English mustard, salt, and cayenne pepper to taste. Let the sauce cook slowly, or barely simmer for about twenty minutes. Strain; add a tablespoonful of capers; boil five minutes more, and serve.

*Mille-feuilles*—A very light, many-flaked cake.

*Minnestrone*—One of the most popular of Italian soups. It is made thick with green vegetables.

*Mint*—An aromatic herb utilized in making foods and drinks.

*Mint Sauce*—Pour half a pint of vinegar in a saucepan; add half an ounce of brown sugar, and reduce. Add half a pint of water and bring to a boil; then add a tablespoonful of finely minced mint.

*Mirabelles*—A name applied to small, yellow plums.

*Mirepoix*—A rich gravy of white and brown stock, thickened with herbs and seasoned with condiments, in which meat is slowly stewed.

*Mirepoix Sauce*—Put a quarter of a pound of butter in a saucepan. Add half a pound of fillet of veal, a quarter of a pound of fat bacon, a quarter of a pound of lean ham, a carrot and one onion, all cut into dice.

Add some parsley, a few mushrooms, a small shallot, half a bayleaf, a little thyme, basil, clove, mace and pepper, and a suggestion of grated garlic. Cook over a slow fire for a few minutes; then, add the pulp of half a lemon, a ladleful of consommé, and a wineglassful of white wine. Simmer for two hours, and squeeze through a tammy.

*Mirlitons*—A kind of tart made of puff-paste; similar to *fians*.

*Mirotons*—Boiled beef smothered in onions. The term is sometimes misapplied to dishes of cutlets, or fillets arranged in a circle with the sauce in the center.

*Misere (a la)*—In the poverty style, or cooked very simply.

*Mittonner*—Simmering, or stewing slowly.

*Mock-Turtle Soup*—A soup made of calf's-head instead of turtle.

*Moderne (a la)*—In the modern style.

*Moelle*—French for marrow.

*Monglas Sauce*—Mix a level tablespoonful of flour with a heaping tablespoonful of butter until smooth. Moisten with some of the liquor in which the joint has been boiled. Add some essence of mushrooms, and boil for ten minutes. Remove from the fire; thicken with the yolks of three eggs beaten up with milk. Return to the fire; stir constantly, and bring to a boil once more. Remove from the fire again; add the juice of one lemon, some chopped mushrooms, and minced parsley.

*Montebello Garnish*—Heat a pint of tomato sauce and the same quantity of Bearnaise sauce together, but do not let the mixture boil. Add three sliced truffles; cook for two or three minutes and serve.

*Morille*—An edible fungi similar to mushrooms.

*Moscovienne (a la)*—In the Moscow style.

*Mouiller*—To add broth to meats during cooking.

*Moule*—French for mold.

*Mousseline*—A cake, similar to the *brioche*.

*Mousquetaire (a la)*—In the musketeer style. (See *Musketeer Sauce*.)

*Mousse*—A light, frozen dainty.

*Mousserons*—Small mushrooms.

*Mousseux*—A term applied to dishes that are foamy, or frothy.

## WOMEN ACCUSED OF WRITING BAD BOOKS.

BY LULU C. MOHLER.

[A certain conference of men recently made the above charge.—Ed.]

WOMEN, poor creatures, are rather feeble-minded. They have been so adjudged since the beginning of the race by some of the most eminent masculine minds. I have often been puzzled as to why God made a creature so deficient as a woman for man's most intimate associate. He perhaps made an awkward blunder. But then, some men, if they are scholarly, find

life a burden without an intellectual wife, while others of the best approved minds, state that man, in his restful moments, longs for primitive things, and a woman at her best, for him, is one who is a comfortable homemaker, and the less she knows about Homer, or Euclid, or philosophy, the better. Tastes differ.

I recall the boys and girls at home, arranged around the room, deep in geometry. Then we worked together at zoology, algebra, physics and literature, and, for the life of me, I cannot remember one girl who showed signs of imbecility, tho some showed symptoms of insanity in various forms. Hence, it is hard for me to be convinced that women are not as gifted, intellectually, as men.

When it is said that women write bad books, I think of some books they have written that are bad—but *all* bad books were not written by women. If any man ever read George Eliot's books—tho she makes some errors—so did Thackeray—Margaret Deland's, or others in America or abroad, in various lines of thot, he would certainly give us a fair hearing.

When I think of a man daring to say they find nothing of worth in the poems of Elizabeth Browning, or in the editorial and literary work of Mary Mapes Dodge, I remember that such men dare to criticise the Bible, and analyze and find wanting the teaching of the Master.

Women do not get equal credit from the world for their good works, while men get unstinted honor and fame. This is a fact, that all who run may read. Well need men tremble to see the day come when woman will come into her own. She will be found no unworthy match.

The number of women that have achieved truly perfect things in science and the arts is not very large. Only a few among women, compared with many men will become thoro scholars. Why? Because of their nature. With women the voices and longings of the heart are almost stronger than she can resist, and if she lives up to them fully she finds little time left to become a profound scholar in books.

I am thankful for the scholars. They make a way; but because the number of masters among women is small, is surely not because they are mentally deficient.

*Leeton, Mo.*

## GOOD SENSE IN EDUCATING GIRLS.

Richard Seidel.

A girl may sow no wild oats. A boy may—that is, if he is not found out. Never mind whether a boy's honor or self-respect is sullied, that is another matter. But the girl's soul must be as snow: her virtue beyond reproach. So spreads our social law, and on its iniquity we need not here dwell. What is an "industrial" for a boy spells ruin for a girl. Let her make one false step, no matter what the temptation may have been, and the world looks askance at her: yea, turns from her. Every hand is raised against her. Women especially, never condone, never for-

get—except a few, God bless them. As the Nazarene turned toward the fallen Magdalene, women turn from her; so far are we from his teachings today. And then to help our daughters along to the absolute guardianship of the Temple of Chastity without a flaw, we do what? Explain the most imperious force in all human nature: the most masterful instinct of the race? No, no! That would be touching on life's processes, and life's processes are indelicate, immodest! The springing of the flower from the seed; the chicken from the egg; the tree from the root—these are low, these are vile! Such knowledge would mean to a girl a knowledge of herself that she must not have! The conservation of the race must remain to her an unsolved riddle. The most disastrous pitfall for a woman is before her: the critical moment, the crucial instant may face her at any time. But the truth, the one weapon that could be her sole safeguard—that must not be "told" her. That would be the inculcation of an impure thought! It is enough for her to know—nothing!

#### GOOD MOTHERS.

A GOOD mother must be kind, sweet, affectionate, comforting. Other comforts in a home can be bought with money, but not these. She is the center of life in the home, for when everybody and everything fails, then youth and strong old age goes back to mother. Friends and money may be swept away, but mother never.

A good mother must be firm. Not obstinate and contentious, but settled enough to carry out a deal for good, over and above the whims and objections of children.

To be firm, and unyielding, when right, is the surest way to win respect. Everybody despises the unstable and weak-willed fellow. If children are allowed to run the finances or social events of a home they would sink the entire craft. Their place is subordinate by divine authority and by the nature of things. They need a post, an anchor safe and sure and not one that is uncertain.

For this reason firmness is one quality in a good mother. A good mother must be a Christian. Not one simply in form, but she must reflect the very heart of God. As he gave his Son for his children so a mother must die to her own selfish desires and let God's will become hers for the saving of her children. To direct young souls with an immortal destiny is a task fraught with tremendous responsibilities. To try to do this without help from the Infinite is as hazardous as it would be to place some children in a little row-boat and launch them on the Atlantic Ocean in the teeth of a gale!

For the children's good and the mother's own welfare, know the will of God and practice his teachings. This is more essential than good clothes and well-furnished homes.

#### UNSUNG PRAISES.

EVERYWHERE the public at large and the press are lauding philanthropists of the Carnegie and Rocke-

feller class, while the associated charities and other unions for help and relief eke out a very prosy life so far as being noticed and commended by the public is concerned.

There are about 4,000 chartered benevolent institutions, independent of church, in the United States. The aggregate amount of sunshine, health, joy, relief and downright cash distributed by these societies would eclipse each year all that Carnegie will ever give to the world, yet Carnegie is flaunted here and there as a great benefactor. And indeed and in truth he is a worthy example, but we are measuring up the unnoticed goodness of those who struggle to do, and do not donate a part of their *surplus* only. We praise their mite and might.

#### CHILDREN WITHOUT HOMES AND HOMES WITHOUT CHILDREN.

THERE are said to be 2,000,000 childless homes in the United States, while New York City, alone, has 25,000 homeless children. Some are foundlings having been deserted by the parent. Others are outcasts, their homes having been broken up and the parents disappeared. Others are truants and wayward urchins who have either deserted home or have been led away by evil associates.

But think of the comfort which these 2,000,000 homes could dispense to these little street wanderers, hungry, dirty and friendless! Many a crime and state expense could be saved by saving these orphans from their awful condition.

#### WHY DO BOYS DROWN WHILE SKATING? THEY VENTURE.

THE papers are full of sad stories these days about boys drowning while skating. One, two, three, yes as high as five boys all drowned at once, has been the record so far. From our office window we watch them skate on Fox River and it is easy to see why so many drown.

There goes two boys now for a skate. The ice is frozen about one-third way across the river. They go cautiously, stopping every few feet to test its strength. On and on they go. Finally one stops. His instinct of fear calls a halt. The other goes further and coaxes the second one to come. He is now within ten feet of the water. Can he go five feet further? Two steps more and a snapping is heard twenty-five feet behind him. He turns quickly for he knows the danger, but down they both go under the ice, never more to bless their happy home.

It was all because of a *venture*.

Many older people venture into other things with just as fatal results. There is always enough good, safe places in which to reap sweet joys without so much venturing. Take the safe road!

## SOME KITCHEN HINTS.

DELICATE blues and pinks can be laundered without fading in the following way: One teaspoonful of turpentine put into half a gallon of water. Wet the goods in this and hang in the shade to dry.

A good share of my ironing is done with a clothes-wringer. If taken while still damp, pillow-cases, towels, sheets, and all rough pieces can be successfully treated this way. This means a considerable saving of fuel and labor.

## THE PRACTICAL SIDE OF JOHN WESLEY'S LIFE.

JOHN WESLEY is known to history as an evangelist only, but he was a practical reformer in economic life as well. He started a poor man's bank, a poor man's lawyer, a poor man's doctor, a labor factory for the unemployed, a household salvage corps, a prison mission, a cheap printing press, free public libraries and a general associated public charities.

From all this it appears that he was not a mere theorizer. Preachers and good people of today need to partake more of such practical turns. From the above record it is no wonder that John Wesley's name continues to live.

## WHY SO MANY FIGURES?

WE have used statistics rather freely of late, not because we had nothing else to offer but because the business expansion of the past few years excels anything in modern times and deserves to be itemized and compared.

While some people do not relish figures in their reading matter, yet there are some facts which compel figures to be served with them. Is it not interesting to know that the government had about six times as much money on hand last October as it had twelve years ago?

We do not offer you all poetry nor all prose, all concrete nor all abstract matter, but generally for what we do offer there is a reason.

## WHY DO WE URGE ORPHANAGE WORK?

BECAUSE so many good people can engage in it both to the advantage of themselves and the orphans. Very few people are called and qualified to grace a pulpit or teach in Sunday school. Fewer yet can go abroad to spread the kingdom of God. Only a few are situated so that they can go and come at their pleasure, and give their entire time to charity. Only a few can enter the various avenues of religious work, but look at the multitudes of good people who could give a home to one or more orphan children and save them from crime. Because of the *great need of the children*, and the *great supply of homes* we bring our orphans to your doors.

## THE FAIR COVER.

JOSEPHINE HANNA.

An emblem of purity, some say, the snow  
Wings downward to earth; in a sense, it is so:  
For hidden beneath it, each unpleasant sight  
Lies buried—forgotten, and seemingly white,  
But ah we shall find that with mocking surprise,  
Whence thistle lies buried will thistle arise,  
And thus its fair robe more an emblem may be,  
Of sense-blinded time, to the Eternity.

Snow sepulchre, hiding earth's filth and disgrace,  
A season, yet powerless sin's curse to efface,  
Thou freezest the water, e'en while it descends  
From Heaven, the stains on earth's bosom to cleanse,  
Like does the offender whose unmelting heart  
Holds mercy at arms-length, and bids it depart,  
And buries alive sins which Christ would remove,  
To make place for mercy, and pardoning love.

Withal, fairest snow, though this semblance we see  
Of ill, yet 'tis willess, hence sinless, in thee,  
For cov'ring like charity what is more vile,  
Pure—spotless by nature—art thou all the while,  
And uppermost holding the spotless to view,  
Art bidding us think of the honest and true.  
E'en underfoot trampled and soiled by men,  
Thou, melting, resolvest to pureness again.

The semblance proves not of sin's kinship, indeed,  
Yet hearts at the thought of earth's hidden sins, bleed  
To know the fair-cover of much we admire  
Must melt like the snow which earth's form doth attire;  
For better it were, than as Angel of Light,  
Did sin but discover itself to our sight,  
'Twere better to face it, with hope to o'ercome,  
Than blinded be to any ill 'neath the sun.

For wrongs, never righted, may open our eyes,  
And saints to us cited prove wolves in disguise,  
And policy prove the impulse to have been  
Of deeds which were lauded, and works counted clean,  
Yea, subterfuge show inconsistency's touch,  
And honor—its bartered, alas, over-much,  
When truth is revealed, for in candor, you know  
Not every thief may be tracked in the snow.

Logansport, Ind.

## TWO POETS.

RICHARD BRAUNSTEIN.

One sang in studied verse of pain,  
Whose heart had known no anguish;  
Past him the world unheeding rolled  
And left his song to languish.

One sang the pain, the bitter pain,  
That gnawed his heart to madness,  
And lo! the world kneeled down to kiss  
His tear-stained cup of sadness!

## SAY NO TO RUM.

JOHN S. FERNALD.

In elegant club room or low den of sin,  
Drinking champagne or brandy, rum, whiskey or gin;  
Full many a drunkard was brought to that pass  
By not saying "no" to the first social glass.

# Esperanto, a World Language

## What Is the Origin of Esperanto?

ESPERANTO was created by Dr. L. L. Zamenhof, a Polish physician, who was born at Bialystok, Russia in 1859. In his native city were spoken side by side Polish, Russian, German and Hebrew. The struggles, often sanguinary among the diverse-tongued people, led him to devote his entire spare time to the creation of a neutral language, which could cause peaceful and successful interrelationships.

## What are the Claims of Esperanto?

By its systems of terminations, a word is quickly and correctly placed as a part of speech; by the simplicity and regularity of its grammar, a person can easily acquire its knowledge; by its system of suffixes and prefixes (which Prof. Max Muller terms the genius of the language) which permits all shades of expression and all degrees of elasticity, it is capable of being used for all commercial, literary and scientific purposes.

## Is Esperanto Easy for an English-Speaking Person to Learn?

Being based upon those root-words which are common to the greatest number of languages, the Latin element is closely associated with the fundamental basis of Esperanto, therefore the French, Spanish and Italian people acquire it most easily, being able to recognize possibly 70 per cent of the words on every page; while the English recognize about 60 per cent; and the Germans about 40 per cent. There are about 3000 root words in the whole of this "one letter one sound" language, while M. de Beaufront assures us that there are 2,265 forms of French verbs alone! So that while one is learning French verbs he may acquire nearly the whole of Esperanto.

## What are the Uses of Esperanto?

The jealousy of nations which forbids the use of an existing language brings Esperanto to the front in the rivalry of nations for the world's trade, therefore Esperanto, being taught in the commercial colleges of England and France is fast becoming a factor in the commercial world. In literature many of the world's classics are already translated and scientific original writings are rapidly appearing in Esperanto journals, besides a large number of popular writings. The Red Cross Society of the World, peace organizations, Christian Endeavor Society, Socialists, Good Templars and many other international societies have adopted it, and publish proceedings in the language, while in France the Code of International Laws has been recently translated into Esperanto.

Beside these things a moral obligation is an incentive to many people to take part in an international movement, which, by means of a neutral idiom, can bring all people nearer, into a closer relationship, into a common brotherhood. Tolstoy says "The sacrifices which every person in the civilized world will make in learning Esperanto will be small; the results which will be attained will be so immense that one can hardly refuse to make such effort."

## What Congresses have been held by Esperantists?

The first world's congress was held at Boulogne-sur-Mer, France, in August, 1905. The second congress was held at Geneva, Switzerland, in August, 1906. The third congress was held at Cambridge, England, in August, 1907. These congresses had an attendance each of 1500 to 2000 Esperantists representing twenty to twenty-three nationalities and about fifteen to eighteen unlike tongues. They represented about 1,000,000 Esperantists throughout the world.

## What Criticisms have been Made by the World's Scholars?

Rector Boirac of Dijon, France, says, "The consequences of Esperanto, so far as concerns the future progress of humanity will be hardly less important than those that followed the invention of printing."

Max Muller said, "I have studied Esperanto and place it far above its rivals."

Sir Wm. Ramsay, K. C. B., says, "It is almost incredible that the whole essential grammar of a language can be given in a paragraph; but it is none the less true."

R. J. Lloyd, D. Litt., M. A. University of Liverpool, Eng., says, "I have studied Esperanto with much care and am now teaching it in the University. The ease of learning it and the accuracy of expression of which it is capable are both very surprising."

## What Recognition Has Been Given Esperanto?

In national affairs, its study is recommended by the European countries amongst the officers of the army and navy, and in the Red Cross Society of the World. It is designated as the official language of the International Scientific Association, of the International Legal, Medical and Dental Societies; and of the International Peace Congress.

In the church, Esperanto has received the approval of Pope Pius X. and it is permitted to be used in the meetings of the Cardinals; it is used

extensively by the Christian Endeavor Society throughout the world, and by the Y. M., C. A. During the recent Congress in Cambridge there were preached, simultaneously from the local church pulpits, the Protestant Service, the Roman Catholic Service and the Congregational Church Service, in the Esperanto language.

In the commercial world, Esperanto has its own international commercial journal published in Germany; is taught in the London Chamber of Commerce and the Commercial Colleges of England, France, Germany and Belgium, and by its system of Esperanto Consuls throughout the world is fast demonstrating necessity and its usefulness in facilitating business transactions. In the report of the Bureau of Labor and Commerce in March, 1908, the merchants of the United States, who have or desire an international business, were warned that unless they took up the international language Esperanto, they would see the salesmen of Europe running over the world taking orders everywhere in that language.

In literature, the Esperanto language is fast becoming a rich repository in the translation of masterpieces of all countries. In France, Belgium and England it is being introduced into the public schools.

#### NARROW-MINDED.

Who are they and where do they live? No one ever heard any one confess the above condition. Narrow-minded is not so bad in itself until it wears the crown of bigotry and wields the scepter of authority. Then look out!

Years ago, a family moved about ten miles from their place of birth, into another county. They became acquainted with the ways of a new neighborhood and traded at a new county seat. In five years' time they moved back to the old home, and they assumed to have learned enough, and had enough experience to govern a state and control six or eight railroad systems, besides.

There was nothing, no place, no people, nor ways of doing anything only as it had been done in the new county, where they had lived five years. They proved every assertion and opinion by what some one in that county had said; they did, or tried to do, everything the way those people had done. They were loud and active in reforming their old neighbors, some of whom had seen a large part of the world, both at home and abroad.

This family was narrow from two standpoints: First, their base of calculation was very narrow,—not over ten miles of observation. Second, they surrendered and threw away good things already learned and substituted inferior goods, besides surrendering their own standards and judgments.

As a rule the person who knows only one phase of life, or the workings of one calling, or have a smattering knowledge of several, calls all other people narrow who do not know more of his own chosen lines than he does.

One time at school, a real blockhead in everything but spelling, spelled the school down, and for years after that he expressed his inflated estimate of himself by saying, about other people, "He don't know nuth-in'." Just so with many grown people,—those who do not know what they know, they call narrow.

As a rule those who have studied the deepest and longest on practical and theoretical questions do not parade themselves and make such a splutter as does the fellow who got only enough of some question to make him lopsided, consequently he is always a noisy picture because he has a busy time trying to keep right side up.

Be careful who you call narrow. A good grandma, whom we know, never learned to read, hence never got any schooling. She could not shine nor compete with smart high-school lassies, on the questions of the day, but in times of sickness and death, young people's quarrels and family upsets and church work, her judgment and advice were above impeachment. Was she narrow? Not a bit. Of books she knew nothing, but of human nature, right and wrong, and such questions, she could instruct all the university presidents in the world.

#### DO ANIMALS DOCTOR THEMSELVES?

MUCH interest has been aroused during the past year upon this question. Some have testified of well known cases where snipes bandaged broken legs with the evident purpose of healing the break. Others scorn at the idea that the shy, elusive, wild animals should give evidence of any such sentiment which heretofore was supposed to belong to man alone.

Animals have the instinct of self preservation, and of eating wholesome food. They also flee from danger, and know when they are wounded. Wild animals have been known to fight for each other. Buffaloes on the prairie would form a circle around the calves and weaklings of the herd and defend them to the last. Dogs know enough to keep their sores clean and coated with the healing saliva of their mouths. The dog is also known to eat grass when he shows signs of sickness.

Some claim that wild birds are cruel to those who get a broken limb and drive them out of their flock to starve, or else perish from their foes. It seems possible that while the instinct of one animal is prominent in one direction the instinct of other animals leads out in some other direction. Some species may even show a concern and care for health, and broken limbs that is wholly lacking in other kinds.

## CREAM OF MAGAZINES

### PLANT CULTURE BY ELECTRICITY.

An exceedingly interesting experiment is being conducted at the Royal Botanic Gardens, Regent's Park, London under the name of "the Thwaites Electric Culture", and if it bears out under a lengthy trial all the features that the inventor claims, it is likely to revolutionize the present methods employed both in the heating of glasshouses and the manner in which plants and fruits are hastened to maturity independent of the seasons.

Before describing this new system of electric culture, a brief reference to previous experiments will not be without interest. Very soon after Jablockhoff invented the electric arc, it was discovered that the rays from this light stimulated the growth of plants, and the work was continued by Sir W. Siemens in England, Baily in America, Lebstrom in Sweden, and Berthelot in France. Both Sir W. Siemens and M. Berthelot died before the results of their experiments became known, but they were quite classical and of splendid promise. Baily was convinced that the arc light promoted assimilation and hastened growth and maturity. Lebstrom found the positive electrostatic current to greatly accelerate the circulation of the sap, and

modern producer-gas suction engine coupled to a dynamo. The electric energy developed by this plant is allocated to the feeding of the arc lights in the glasshouse. An electrostatic machine is driven from the gas-engine crankshaft, and the electricity is discharged by points along the plants to electrify not only the air, but the plants and their roots as well.

The arc lights are equipped with special reflector hoods, by which the beam of light is confined within narrow limits of concentration. The open end of the hood is closed by a water screen, made up by a glass trough filled with water. This water screen, through which the light rays have to penetrate, is intended to secure as near an imitation of natural solar effect as possible, and to limit the effect of the rays; and if it is desired to screen from the plants any portion of the spectra, colored water can be employed. The roof of the reflector is provided with a chimney, to permit the escape into the roof of the glasshouse of the nitrous oxides that may be produced. It is arranged that the arc lights are automatically constantly and almost imperceptibly moving along the entire length backward and forward of the glasshouse, radiating a powerful beam of light on both sides.

At the present time daylight is being extended for a period of four hours. Just before sunset the powerful arc lamps are lighted, and the beam flits from plant to plant as it moves slowly up and down the glasshouse. When the days get shorter, the light will be put in operation for longer periods. Mr. Thwaites estimates that with his system, from three to four producing seasons in the year will be attainable. If, of course, choice fruits and flowers can be produced at any period of the year at no great cost, the invention should certainly possess great commercial value. As already stated, at the moment it is purely in its experimental stage, the plant having only been in working order for just a month, too short a period for one to predict likely results. At the same time, it is an experiment which will undoubtedly be followed with the greatest interest.—Scientific American.

### \* \* \*

#### "A 1 BUT THEY ALL DRINK."

Dunn's commercial rating so described a firm of four young Boston business men. They were rich and prompt, and could not be rated otherwise than A 1 at that time; but a few years later two of the brothers were dead, another was a drunken sot out of business, and the fourth one was dependent upon charity. Whisky ruins fortune, health and mind.

The plants on the right hand received four months' electric treatment. The others none.

the more fertile the soil the more vigorous the vegetation, and the more effective the current; it was also found to increase the proportion of saccharine.

Coming to the present experiment, we have an ordinary glasshouse in which have been placed some two hundred plants, consisting of geraniums, fuchsias, various kinds of palms, grasses, tomato plants, etc. The plants are being forced by light from an arc lamp, and the house heated in a new ingenious manner. This apparatus, which is causing much discussion among electricians, consists of a

## HOW ANIMALS ACT DURING EARTHQUAKES.

The news dispatches, it will be remembered, announced that on the eve of the great earthquake at Karatagh, in Central Asia, on October 20, all the dogs of the region set up a howling, horses stampeded, and cattle bellowed with fright. This report is in singular confirmation of some general principles as to the conduct of animals during earthquakes laid down in an article in a recent number of the Dutch review, *Vragen van den Dag*.

The writer of this article reminds us of the frequent contention that some animals are able to feel in advance certain conditions of the weather or other natural phenomena, and that they are thus, in this respect, better endowed than man.

Whether this power has been lost to man in the process of civilization, or that it was never possessed by him at all, we would not undertake to affirm. Although animals are not to be wholly regarded as weather prophets, still by a close observation of their behavior under particular circumstances of the kind, something may be gained in this line of human knowledge.

In connection with the fearful catastrophes of recent date in Italy, California, and elsewhere, which, like so many others of like nature, will long retain a hold on human memory, attention has again been called to the fact that many animals give intimations of such great disturbances in advance by certain particular and often unusual conduct. It is particularly such animals as have their abode under ground that often indicate, days before the event, that something unusual in nature is about to occur, by coming out of their hiding places under the ground into the open.

Aelian mentions that, in the year 373 before Christ, five days before the destruction of Helike, all the mice, weasels, snakes, and many other like creatures, were observed going in great masses along the roads leading from that place. Something similar was noticed also, later, though not to so marked an extent as in the case mentioned by Aelian. This leaving of their subterranean abodes by underground creatures on such occasions might possibly be explained by the emission of various malodorous and noxious gases during these disturbances of the earth.

But not only do animals living under ground furnish indications that something out of the ordinary is about to happen. The larger animals on the surface, such as cows, horses, asses, sheep, and many birds, even, seem to get premonitions of particular natural phenomena and events.

Thus it is related that in 1805, during an earthquake, the cattle at Naples and its neighborhood set up a continuous bellowing some time before the event, at the same time trying to support themselves more firmly by planting the forefeet widely apart; the sheep kept up a continuous bleating, and hens and other fowl expressed their restlessness by making a terrible racket. Even the dogs gave many indications of uneasiness at the time. The actions of animals observed during the great earthquake of 1783 seem to have been most remarkable. Thus the howling of the dogs at Messina became so unendurable that men were sent out with cudgels to kill them. Their noise was most marked during the progress of the earthquake, while it was difficult to pacify the animals in the vicinity for some time even after the cessation of the shocks. Dogs and horses ran about meanwhile with hanging heads, or stood with outstretched legs, as if aware of the need of planting themselves firmly. Horses that were ridden at the time stopped and stood still without orders, trembling so at the same time that no rider could remain in the saddle. Scophus tells the story of a cat during an earthquake at Locris which set up a most dismal caterwauling at the approach of each new shock, meanwhile constantly jumping from one point to another.

The roosters kept up a continual crowing, both before and during the earthquake. In the fields Scophus observed hares so under the influence of the terrestrial disturbance that they made no attempt to escape and seemed in no way disturbed by his presence. A flock of sheep could not be kept on the right road, notwithstanding the efforts of shepherds and dogs, but fled in affrightened haste to the mountains. During the same year of 1783, fear had taken such possession of the peasants of Calabria that they were seen to flee from their huts the moment dogs began to howl, asses to bray, or cows to bellow. Birds, also, seem to have premonitions of the coming of such catastrophes. During the earthquake at Quintero, in Chile, in November, 1822, the gulls uttered all sorts of unusual cries during the whole of the preceding night, and were in constant restless motion during the quake. On February 20, 1835, the day before the earthquake at Concepcion, in Chile, at ten in the morning, great flocks of sea birds, mostly gulls, were seen to pass over the city landward, a phenomenon not to be explained by any stormy condition of the weather. It was fully an hour and a half after their passage, at 11:40 of the forenoon, before the earthquake came, one so disastrous that nearly the entire city was reduced to ruins. Even the fish in the sea seem to be disturbed at the approach of an earthquake. Thus during the one of 1783, quantities of fish were caught at Messina, of a kind that usually keeps hidden in its secret abodes at the ocean's bottom. And Alexander von Humboldt, the famous traveler and naturalist, tells of having observed the crocodiles of the Orinoco leaving the water and fleeing to the forest during an earthquake.—Review of Reviews.

## THE EUROPEAN "RETIRED" CLASS.

According to Continental views, whoever can secure for himself a daily pittance without toiling for it, ought not to toil, and no credit is given to the wealthy young man intent on increasing his capital by engaging in some trade, nor to the man of fifty or fifty-five who remains at work after amassing a small competence.

Therefore, we meet in every Continental city a large class of idle men, who, having dismissed for the balance of their life the care of money-making, have no ambition beyond that of living and enjoying life. That their enjoyment includes but a meagre dole of life's material comfort is evident, but this gives them a peculiar charm.

There is, however, a real value to the state in their view of life. Many devote themselves to intellectual pursuits which routine work made an impossibility in the preceding years. A large number of interesting works on military matters, science, history, biography, and memoirs, are due to the pen of "retraités" from the army or navy, who, owing to the importance the army plays in European life, form a large contingent of the retired class.

Some of the retired Continentals engage in minor political activities. Town councillors are in the majority of cases retired officers or former civil-service men, who, with their indifference to money questions, make perhaps rather poor administrators, but public-spirited and of an unimpeachable character.

The influence of this great leisure class in the shaping of the nation's tastes and ideals is a thing an untraveled Anglo-Saxon can hardly realize. Thanks to this "idle" class, literary and artistic salons after the fashion of the eighteenth century are still a possibility on the Continent of Europe. In the late afternoon the "retraités" gather either around the marble tables of some café and play cards, or preferably meet at the fireside of some hospitable hostess. These men of a mature age, who have ample leisure for thoughts of the past and can observe the present without haste, make the most delightful conversationalists.—Review of Reviews.

# Echoes from Everywhere

## FOREIGN.

### English Debtors in Prison.

Returns of the county courts of England issued from the home office show a continuous increase in the number of persons committed to prison for non-payment of debts in England and Wales. In 1900 there were 1,131,775 complaints and 7,890 debtors imprisoned; in 1906 there were 1,265,908 complaints and 11,986 debtors imprisoned. In Ireland imprisonment for debt is almost non-existent, but 80 being sent to prison in 1905.

### German Criminal Code.

In other respects the German criminal code which covers the whole kingdom has been modified so as to meet modern requirements. In the United States every state has its own code, and the variation and contradiction are great; but in Germany the standard of criminality and of penalty is the same thruout the empire. Among the subjects concerning which more stringent laws have been passed are horse racing and various forms of gambling and the working of mines without authorization in territory under German protection, whether they contain minerals, coal, or salt. The new mining laws are very elaborate. Other laws were adopted last year for the protection of the government against frauds in revenue. Such frauds are to be punished by a fine equal to four-fold the amount of the duty. Falsification of bills may be punished by imprisonment and loss of civil rights. There are also laws protecting the government telegraphic and telephonic service.

### England to Protect Youth from Cigarettes.

If a bill which passed its first reading in the House of Commons becomes a law, juvenile devotees of the cigarette will have a hard time in indulging their appetite.

The act is a government measure which amends the existing laws for the protection of children. It prohibits smoking under the age of 16, provides penalties for any one younger than 16 years old found smoking in the street or any other public place, and makes the sale of cigarettes to persons under 16 years a punishable offense.

Among other features the bill establishes juvenile courts thruout the country and calls for special places of detention for children, instead of sending them to the ordinary prisons.

### Prison Work in Toronto.

No city in Canada takes a greater interest in its prison work than Toronto. Lieut. Col. Joseph S. Pugmire of the Salvation Army has had great success in dealing with prisoners. The prisoners are interviewed. On discharge they are met by some of the agents of the Salvation Army and they are furnished with clothing and lodging when necessary, and with work.

By a new French process, milk powder is produced by forcing the liquid under high pressure thru a tube only

1-250 inches in diameter into a closed chamber heated to 167° F. by a current of warm air. The milk expands to vapor, the air current carries off the water, and the solids fall in powder.

Ignifuge, as a new French material for making wood unburnable is called, is a mixture of 135 grams of sulphate of ammonia, 15 of borate of soda, 5 of boric acid, and 1,000 of water. At Bordeaux impregnated wood and shavings remained in a hot fire until the wood fuel was consumed, and were found simply charred. Treated paper and cotton fiber were consumed slowly without a blaze.

GENERAL.

### WHISKY'S AWFUL TOLL.

Sixty-five out of 67 Murder Cases Caused Directly by Intoxicating Liquor, in One Illinois Lawyer's Experience.

PILLOW, SMITH & STONE,  
LAWYERS.

Marion, Ill., Jan. 24, 1908.

Mr. Frank W. Loy,  
Effingham, Ill.

Dear Sir: Answering yours of the 21st inst.: Will say that I have been practicing law about twenty-seven years, and have been connected with the prosecution or defense, with sixty-seven murder cases, sixty-five of which were caused directly by the use of intoxicating liquor. During my somewhat extensive criminal practice, I can safely say that at least 97 per cent of all the crimes that have come under my observation, were the result of the use of intoxicating liquors, either directly or indirectly.

Very truly,

George W. Pillow.

—From Illinois Issue.

### Improved Roads for New England.

Unless the plans of the road builders of three states fail, the present year will see the practical completion of a continuous highway of modern construction extending from New York to the western Maine border and the heart of the White Mountain region in New Hampshire.

In the network of highways that have been built from town to town under state auspices in Massachusetts, New Hampshire and Connecticut, the road commissioners have not lost sight of the larger plan for a great central trunk line through New England for automobile and carriage travel. Each year of the last decade and more has seen portions of the route constructed. Some gaps still remain, but they are comparatively few and short.

It is estimated that 85 per cent of the crops of 1907 has been shipped out of North Dakota by this time.

### A Jesuit Celebration.

This year the Catholics of Maine will take cognizance of the 300th anniversary of the founding of the Jesuit mission on Mount Desert Island. In 1608 the Jesuit Priests Peter Biard and Enemond Masse established a mission on the island. The exact site is uncertain, but is supposed to have been on a spot at the foot of Flying Mountain, about two miles north of the present village of Southwest harbor.

They lived and labored for five years until the freebooters sent by Argall of Virginia invaded the island, burned the chapel and mission buildings, desecrated the holy vessels and drove the priests to far-off Canada.

A magnificent Catholic church is now in course of erection in Bar Harbor on the very ground pressed by the feet of the devoted priests 300 years ago. The dedication of this church, coming as it will on the 300th anniversary of the founding of the first mission and the planting of the first cross on the island, will be an event of more than ordinary significance.

### For a Pan-American University.

Activity looking towards the founding of a Pan-American university has finally taken definite shape in a bill brought before the House of Representatives Monday by Congressman George P. Lawrence of Massachusetts. Briefly sketched, the scheme as it exists so far provides for an administrative centre at Washington, with a branch of the university at the capital or chief city of each country of the western continent. The formal statement of the purpose of this project is to promote co-operation among the higher institutions of learning of North, South and Central America. One of the avowed intentions of those who project the undertaking is to diffuse industrial education. Between Hudson Bay and the Straits of Magellan there is a wilderness of material upon which geology, ethnology, history and science have only begun.

There has been so much fine weather in North Dakota this winter, that the residents are already boasting of their "banana belt." On Jan. 19, one of the balmy days of the winter, Cando citizens went out to the ball ground, played a game of ball, and had their pictures taken.

### To Feed any Child Hungry in School.

"Every girl and boy whose parents haven't money to buy food for them may come to my restaurant and I will feed them gladly," said Adolf Lorber, known as the "Delmonico of the East Side," of Nos. 274-276 Grand Street.

Mr. Lorber will feed 1,000 school children a day, giving away warm luncheons in the banquet room on the first floor of his restaurant. The menu will consist of soup, roast meat, vegetables, bread and butter, coffee and fruit, with ice cream twice a week.

The school children will have a private entrance, and they won't have to form in line. Every child will be admitted as soon as he or she puts in an appearance. The banquet room accommodates three hundred.

"I know that hundreds of little children go to school daily without food," said Mr. Lorber. The luncheons will be given away, and will be kept up until conditions improve in the lower portion of the city.

The tremendous figures of the amount of lumber cut last year probably ought rather to fill us with apprehen-

sion as to our timber supply for the future than with exultation over our ability to saw wood in the present. In 1907 more lumber was cut in the United States than in any preceding year. The Forest Service estimates that it approximated 40,000,000,000 feet, and that the total mill value of the lumber, lath and shingles produced, was not less than \$700,000,000. We made nearly twelve million shingles and nearly four billion laths for our houses in the twelve months.

Last year the Government disposed of almost thirty million acres of public lands, and set aside nearly forty-four millions acres in national forests. There are now 159 national forests, embracing 150,832,665 acres.

Three New York banks last week closed their doors as an aftermath of the financial troubles. All three had been connected more or less intimately with bankers who, on account of their business methods, were discredited at the time of the panic.

Electrolysis of pipes is now prevented by insulating from the ground. The pipes are covered with a specially-prepared asbestos paper, coated with a water-proof insulating compound, and joints are made tight by strips and insulating cement. The protection is claimed to be permanently durable.

### A Testimonial Against Liquor.

Below is a letter from Chief of Police in St. Louis to Arthur B. Farwell which explains itself. We quote from the Illinois Issue.

January 31, 1908.

Dear Sir—Replying to your letter of January 29, in which you ask information regarding the Sunday closing of saloons in St. Louis, will say that from a police standpoint the saloons being closed on the Sabbath day has been productive only of a desirable result. There is less crime in St. Louis since the saloons were closed on Sundays than ever. Drunkenness on the Sabbath day has been reduced to such an extent as would scarce have been believed. Men who were in saloons all day Sunday are now at home with their families, and the money that formerly went over the bar now goes for food and clothing. This naturally lessens crime. St. Louis has never been so prosperous as it has been during the past few years, since the Sunday closing law has been enforced. Many business interests were at first opposed to the innovation, but since its trial many who are actually engaged in the liquor traffic favor the law. It would be impossible to give detailed facts and figures along this line, and I trust that this general information will suffice.

Respectfully,

E. P. Creecy, Chief of Police.

### Some Hard Hits in the President's Recent Message.

There is no moral difference between gambling at cards or in lotteries or on the race track and gambling in the stock market.

It is not the puppets, but the strong cunning men and the mighty forces working for evil behind and through the puppets, with whom we have to deal.

When we are able to put the real wrongdoer in prison, this is what we strive to do.

That stockholder is not innocent who voluntarily purchases stock in a corporation whose methods and management he knows to be corrupt.

The apologists of successful dishonesty always declaim

against any effort to punish or prevent it on the ground that any such effort will "unsettle business."

They have hurt honest business men, honest-working-men, honest farmers, and now they clamor against the truth being told.

The business which is hurt by the movement for honesty is the kind of business which, in the long run, it pays the country to have hurt. It is the kind of business which has tended to make the name "high finance" a term of scandal to which all honest American men of business should join in putting an end.

Most certainly it behooves us all to treat with the utmost respect the high office of judge, and our judges, as a whole, are brave and upright men.

The opponents of the measures we champion single out now one and now another measure for especial attack, and speak as if the movement in which we are engaged was purely economic. It has a large economic side, but it is fundamentally an ethical movement.

The methods by which the Standard Oil people and those engaged in the other combinations of which I have spoken about have achieved great fortunes can only be justified by the advocacy of a system of morality which would also justify every form of criminality on the part of a labor union, and every form of violence, corruption and fraud, from murder to bribery and ballot box stuffing in politics.

I do not for a moment believe that the actions of this administration have brought on business distress.

#### The Tobacco War in Kentucky.

Hopkinsville, Ky., Feb. 15, 1908.—The band of masked men who have caused terror in these regions for over a year past rode into Fredonia, Crittenden County, captured James Scadberry, operator of the Cumberland Telephone Company, and cut all the wire connections with the outside world.

Leaving a large guard in the town, others galloped to the village of View, five miles away, and blew up Alfred H. Cardin's tobacco factory, containing 35,000 pounds of tobacco, and set fire to and destroyed Mr. Cardin's barn, containing 10,000 pounds of tobacco belonging to him and his croppers.

The loss aggregates \$10,000.

Mr. Cardin is the buyer for Buckner & Dunkerson of Louisville. Neither he nor his family were at home.

Eighty per cent of Crittenden County farmers have tobacco pooled in the Society of Equity.

Mr. Cardin is not a member. He is a well known citizen, 73 years old, and was formerly a candidate for Governor on the Populist ticket.

The Planters' association has an organization in this county.

Dozens of men have been called out at night and gagged, lashed, and tarred and feathered, while others have been forced to leave the country. Some have been killed.

Hettie Green, of New York City, says she has recently refused to loan money to some of the wealthiest families in that city, among whom were the Vanderbilts. She claims that corporations have been inflating both the quantity and the value of their stock of late years, until it could stand no more and then have sold the stock at these inflated prices. The promoters got the money while the buyers got a piece of paper that is worthless so far as securing money on it is concerned. A dead factory is poor security.

#### A \$20,000,000 Depot.

San Francisco, Cal., Feb. 15, 1908.—San Francisco is to outdo the eastern cities in the way of a magnificent depot. Plans have been adopted by the railway lines of the city for a \$20,000,000 terminal depot to be built in the heart of the city, where all interurban and subways will converge.

#### West Virginia to Vote on Saloons.

The temperance wave has struck West Virginia. The Legislature has passed a bill providing for a prohibition amendment to the state constitution. It is left for the Senate to give assent to the measure.

#### A Blizzard East and West.

Elgin, Ill., Feb. 20, 1908.—Forty-six hours of snow and wind has just ceased. The weather station reports 13 inches of snow on the ground and the wind to have reached 48 miles an hour in Chicago. The storm covered the northern states east of the Rocky Mountains. Ten are reported frozen to death in Chicago. Dozens of trains are stuck in snow drifts. The loss in deaths and traffic is reported heavy in every direction.

#### Good News from Iceland.

Iceland is only half as large as Missouri. The island is volcanic, and very little of its area is tillable. The people have a fight on hand most of the time to raise enough to eat, but they have found time enough to give some hard thot to the moral and intellectual side of life.

Alcoholic liquors are neither made nor used by the inhabitants. To import rum is a penal offense and has been enforced so long that the citizens have lost their desire for whisky.

As a result of this moral condition there is not an illiterate person among the 78,000 Icelanders. There is neither jail, penitentiary, a police system, nor a court. The people support several colleges and a few good, clean newspapers. These, along with an abundance of other good things, is the report brought back by travelers to this north country.

---

## WANT AND EXCHANGE

---

To accommodate some of our readers and bring them in closer touch with each other, we have opened this "want and exchange" column.

Rates, twenty-five cents per insertion, not exceeding four lines, including name and address. Five cents per line for additional lines. However, no "want" may exceed six lines altogether.

**WANTED.**—At once. A reliable man with good recommendations. Married. Experienced in pipe-fitting, well pump work and work in hardware store. Work all the year round. Address Levi Zumbrun, Brookville, Ohio.

**WANTED.**—To sell 1,000 sq. ft. new steel roofing and siding. Corrugated sheets 22 in. x 8 ft., painted red. Price \$15, including nails. A bargain. Just the thing for farm buildings.—J. B. Hollopeter, Pentz, Pa.

**I HAVE** several good farms for sale or exchange in Southern Missouri; climate mild, winters short, land productive, good schools, good churches, fine for fruit. For information address, F. E. Cochran, West Plains, Mo., R. 2.

**WANTED.**—Brethren to locate at Manzanola, Colo. Center of sugar beet and alfalfa territory. Fine climate. Brethren churchhouse in town. Several have already located.—S. Wenger.

**WANTED.**—Some brother with experience to take stock in and manage a bank in a good small town. Address, J. M. Stutsman, Elbing, Kans.

## Matthew Henry Commentary on the Bible

Catalogue Price, \$15.00  
Our Special Price,

1. o. b. Elgin, Only

**\$7.95**

We have reduced the price of this commentary until it is within the reach of all. Every minister and Bible student who does not already have a set of these books ought to take advantage of this special offer. Better send your order at once.

**BRETHREN PUBLISHING HOUSE**  
Elgin, Illinois

## Bible Pictures

A select list of 100 subjects illustrating the International Sunday-school Lessons for 1908.

100 Pictures in black and white, no two alike, neatly boxed. Size 6x8 inches.

Price, 25 pictures, no two alike, 30 cents.

50 pictures, no two alike, 50 cents.

## THIS IS A PROGRESSIVE AGE

Everybody Wants the Best in  
Every Line

**ANGEMA**—a jelly-like medicine—is representative of this fact in a medicinal way. It is not the quick result of an abrupt idea; but it is the PERFECTED PRODUCT of years of training and experience along a chosen line of work.

The RAPIDITY with which people are doing away with old time SALVES and LINIMENTS and using **ANGEMA** proves conclusively that they appreciate our efforts in helping them keep abreast with the times.

**ANGEMA** takes the place of a SALVE.

**ANGEMA** takes the place of a LINIMENT.

It thus serves a TWO-FOLD purpose.

Its REAL VALUE is shown in the TREATMENT of Rheumatism, Neuralgia, Headache, Sprains, Frosted Feet, and, in fact, wherever it is necessary to use either a SALVE or a LINIMENT.

**ANGEMA** is greatly prized where there are CHILDREN. It keeps away CROUP, LUNG FEVER, and COLD on the BREAST or in the HEAD. MOTHERS who use **ANGEMA** in these DISEASES would not be without it.

A 25 CENT TUBE OF **ANGEMA** sent for 15 cents if your druggist does not have it.

We want some one in each community to represent us in our business which they will find CLEAN, HONEST and PROFITABLE.

We want to hear from YOU. May we send you PARTICULARS?

**THE ANGEMA LABORATORY,**  
Garrett, Pa.

## Ropp's New Commercial Calculator and Short Cut Arithmetic

The Standard for Store, Farm, Bank or Factory,

5 1/4 x 2 3/4 in.

Is from beginning to end a greatly improved, enlarged and thoroughly revised publication.

It contains an entirely new system of unique Tables, Short-Cuts and up-to-date Methods.

It is unquestionably the most complete, useful and comprehensive Calculator ever published.

It has more than twice the matter, scope and capacity of Ropp's former editions, of which

**Nearly 1,500,000 Copies have been Sold.**

It is the most convenient and practical Labor-saving work ever used in the business world.

It will make every one independent, sure and self-reliant in all practical calculations.

It will prevent mistakes, relieve the mind, save time and labor, and often loss and trouble.

Its Tables are adapted to all the trades and occupations in the city and country, and

### Show the Answer as Quickly as a Watch Shows the Time.

It also explains and simplifies the principles of Arithmetic, Mechanics and Mensuration.

It will make the study and use of Figures easy and interesting for young and old.

It will enable every progressive mind to become an expert, sure and rapid calculator.

It will prove a boon to all whose education in arithmetic has been limited or neglected.

### 48 Cuts Illustrate the Elements of Mechanics and Mensuration

It defines about 70 points in "Commercial Law" which every man and woman should know.

It is the result of devising, and improving system after system; of spending thousands of dollars in experimenting; of making millions of miscellaneous calculations, and of doing some vigorous thinking during 38 years, by an analytic, practical and persevering mind.

Will send, express prepaid, for 75 cents extra.

## **Mr. World and Miss Churchmember**

By W. S. Harris.

It is a forcible allegory, somewhat after the style of Pilgrim's Progress, but in no sense an imitation of it. Fathers and mothers, it is the book that you should get for your son and daughter, and at the same time read it yourself. You will be stronger for the church after having read it. It illustrates vividly how Satan lures the church member, step by step, from the pure Gospel

until finally he is lost forever. Send in your order at once and you will never regret it. Cloth only.

Our Price, Prepaid .....\$ .75

# ALBERTA

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the colonies already there and enjoy some of the material benefits as well as help build up one of the largest and best colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

## ROGUE RIVER VALLEY OREGON

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

**Daily Tourist Car Line**

BETWEEN

Chicago, Missouri River, Colorado,  
Idaho, Oregon, Washington and  
California Points.

#### TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

#### DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

#### DINING BOOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

Be sure to buy your ticket over

## If You are Going It Is High Time You Are MAKING ARRANGEMENTS

ON the 3rd of March we expect to have about a car load of people leave Chicago, over the Northwestern line, for Omaha, where we expect to meet another car load of people from Duluth, and a third one is to be made up at Omaha by people from different points in Iowa, Missouri, Kansas and Nebraska. This is our first spring excursion to BUTTE VALLEY on the low rates.

Mr. E. M. Cobb and Mr. E. T. Merritt have been lecturing and showing stereopticon views of Butte Valley in the city of Duluth, Minnesota, and some forty applications were taken for homes in Butte Valley. Not all of these people are going on the third of March, but we expect enough for a car load. Several others have left the selection of their lands to friends of theirs who are going on the excursion. This is a very satisfactory way to do when one can not get away at that time.

The price of land is likely to advance immediately after the excursion and these people are anxious to take advantage of the low rates, as well as the low prices of land. Since the fruit men from the north have investigated the Valley and spoken so highly of its merits as a fruit country, the people can readily see that an investment in Butte Valley Lands is not only likely to double itself, but do so very shortly. Some of the people right north of there, last fall, sold their fruit unpicked for a thousand dollars an acre. Of course it will take four or five years for an orchard to get in bearing, but that is all the more reason why the trees ought to be planted at the earliest possible date.

The proper thing to do would be to go on the excursion of March third, clear off the sage brush this spring, plant the ground to potatoes, onions, or grain, and set the apple trees this fall. Get some good orchardist to select high grade Newtown Pippins, Spitzenbergs, and Winter Banana Apples. Those seem to be the favorites of the oriental markets and bring the highest figures. The orchardist could care for the trees properly while young, which would insure a fortune a few years hence.

After reading this you will hardly have time to correspond with us and get an answer before March third, so you had better write to,

GEORGE L. McDONAUGH, Omaha, Nebr.,  
E. T. MERRITT, Omaha, Nebraska,  
D. C. CAMPBELL, Colfax, Indiana,  
ISAIAH WHEELER, Cerro Gordo, Illinois,

## Eternal Verities

By D. L. Miller

## NOT A DRY PAGE

A welcome volume to Christian Apologetics on the lines of Pierson's "Many Infallible Proofs," Gladstone's "Impregnable Rock of Holy Scripture," Sayce's "Fresh Lights from Ancient Monuments."

The author's considerable travels in Palestine have been a great help to him in the preparation of this book which is marked throughout by a manly tone born of convictions formed with full knowledge of opposing theories. There is not a dry page, nor a dull paragraph in the book. The numerous illustrations are drawn with accuracy and high finish.

# Possibilities of IDAHO

---

## Unlimited

---

Many settlers are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for young and old of small means to get good comfortable homes with a splendid income.

### Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

### Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

### Realize \$1,000.00 Per Acre

#### Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

#### Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

### HOMESEEKERS' ROUND TRIP TICKETS

Will be in effect in the Spring of 1908  
Colonists' one-way rates in effect from March  
1, to April 30, 1908

Write for information.

No. 9.

## Our New Infidelity Law and Its Relation To Divorce

ELIZBBETH B. GRANNIS, President National Christian League for Promotion of Purity

It is always a time for rejoicing with one's friends when a victory is won. I would that all the constituents of the INGLENOOK were my friends, and they may be, no matter how wise or convincing any of them may prove to be in opposition to the service we have rendered in securing the present Infidelity Law for New York State. Very few, even among most advanced thinkers, have more than a faint idea of the benefit which would accrue to the human race if both sexes had a just appreciation of the meaning of purity or temperance in marital relationship. If the question were asked us whether every human appetite overly indulged does not deplete and punish itself, we would all answer in the affirmative. I imagine but few among progressive readers have a just conception of the satisfaction, even from a selfish standpoint, experienced by married people who practice temperance through scientific and spiritual self-control. If there is truth in this declaration for selfish comfort and happiness in the marital relationship, what of the added joy and satisfaction in accepting the blessings of offspring from the Creator of life for which we have asked and made preparation to receive. Many have learned by experience the value of the reward of fidelity in wedlock of one man with one woman thru a long life record. Continence, or total abstinence, in marital relationship except for offspring, has but little bearing upon our new Infidelity Law, altho the question of self-control and temperance or purity in the marital relation, is a powerful ally in behalf of this law.

Love is without question the greatest motive power that moves the race or the individual for good and higher development. I hope it is needless to say that no reader will imagine that I refer to any sentimental or emotional affection. I refer to that great love of heart which ought to rule the mental caliber of the nation. Christ in his Gospel always honors the heart above the head. The heart of the pulpit should con-

trol the intellect and the heart of every individual should control every human ambition in the noblest sense. Yet love is not the only attribute for good. Fear is not only the beginning of wisdom; but fear quickeneth the conscience, particularly of the unthinking, reckless go-as-you-please individual. Every law of nature is the law of God, and must be verified in our own bodies that we may secure the highest rewards for obedience to nature's laws.

Many people are more or less interested in the agitation by Church and State of the divorce question. More interest is apparently manifested to prevent the results of careless family training and reckless marriage, than in striving to build suitable conditions for the consummation of successful scientific and spiritual wedlock. Much thinking, talking, and writing upon the subject of divorce has failed up to the present time to reduce proportionately the number of divorces thruout the states. Dissolving marriage ties is largely on the increase in spite of the agitation by the anti-divorce advocates. In my judgment wise counsellors seeking to reduce the appalling evil of divorce should turn their attention largely to better conditions and better training for the highest and most important office in human life that any person can hope to attain. 'Privileges and responsibilities in this relationship are above all others. They bring every human being into direct partnership with the Creator in producing conditions for successful human development with all of its prospective achievement in addition to preparation for immortality. Flippant, jesting, idle, thotless comments and the want of serious thot and expression by persons of broad influence; are chiefly the promoters of the alarming conditions of society regarding the marriage and divorce question. The state is largely dependent upon the church whatever may be said in opposition to this assertion. Notwithstanding the estimate of legislators and many lawyers concerning the influence exerted by ministers and women (non

voters,) we who know, are justified in declaring that when a great number of pastors unite with many women advocates in a moral educational effort, the legislators and substantial members of a community not only give attention but coöperate with them for the righting of the wrong at issue, even to enacting our recent Infidelity Bill into law for the great Empire State.

Individual citizens of the Church and State should seek to interest all organizations and persons pledged to social and civic betterment of the people to learn what are the chief causes which lead to separation or divorce in wedlock. We who are striving to create better public sentiment and teach better methods for preparation in scientific and spiritual marriage know its result in more satisfactory marriage and better offspring. We must seek continually to add knowledge to our own experience and observation according to the scripture injunction.

Our Infidelity Bill was first drawn at my request by one of our very efficient members, the late Ex-Judge William H. Arnoux, who said to me at the time he was glad to draw the bill, believing that agitation of the subject would do good, but that he was sure from his experience that I would never succeed in getting the bill passed by the Legislature. His reason was chiefly that Legislators of New York State would

not enact a law for their own conviction. The bill is an amendment to the Penal Code. It provides that a married person guilty of marital infidelity on statutory grounds commits a misdemeanor, and when convicted is subjected to imprisonment for not more than six months, or to a fine of \$250.00, or both. The law went into effect on September 1st., 1907. It is quite probable as the daily papers have said, that no bill of a moral character has caused so much discussion in or out of the Legislature, as our Infidelity Bill, which is quite similar to that of Massachusetts, Pennsylvania, Vermont, and the District of Columbia. The penalty is not so severe as in some of the states, and severer than in some others. It is a common saying "that as New York State goes politically, so goes the Federal Government." It is equally true morally.

Chief objections against this bill by the Legislators of our state during the past decade have been, that if the bill were to become the law it could not be enforced; that they were opposed to adding dead wood to the Statute Books; and many similar objections. There has been no evidence in New York City, or up the State that the law is to be a dead letter, judging from the arrests which have been noted by the metropolitan press.

Mr. George W. Condon, with Miss Baggett, who were arrested at 265 West 23rd-Street New York City recently by Mr. Condon's wife and mother, accompanied by officers, did not need to appear before a bar of justice to realize there was little truth in the assertion of Miss Baggett, when she threw her arms about the neck of Mrs. Condon's husband when arrested with the exclamation, "He is mine, you cannot take him." These people in spite of their wealth were subjected to arrest under this law with many other similar cases. The same objections have been offered in the Legislature every winter during the last decade by the bill's opponents. For example: A law with a penalty affixed for the violation of the Seventh Commandment will place the whiplash in the hands of lewd women for the purpose of blackmailing men holding high official positions; such a law would include jealous wives to prosecute their husbands; why should you believe men will make laws for their own conviction for your asking; laws cannot force morality into the hearts and lives of men; it is useless to make laws which cannot be enforced, etc., etc.

Many judges and lawyers are opposed to the law and will seek by every ingenuity known to the profession to evade conviction under this law, but any of its advocates and supporters believe that many of these men will be gradually won over to the righteous enforcement of this law. A very conspicuous result of the law during the month of September was that the number of divorces was reduced in each of the courts to almost half in number, and in some to quite one-half compared with previous months.

There is everything to be said in favor of this law and not one sound argument has ever been offered against it. Not one flippant sage, who opposed this law, has ever advocated the erasing of the laws from the statute books with a penalty affixed against *murder* or *theft*—while these laws stand on *each side* of the Seventh Commandment in the laws given by God to Moses, "*Thou shalt not commit adultery.*" New York City has been the great city of refuge for disloyal husbands and fathers where they could indulge every form of licentious debauch without danger of any state law to punish adulterous acts. Rich, irresponsible fathers and lawless sons from Maine to California have found free license and most attractive devices by the ingenious in wickedness to draw them to the best and the worst of cities. Men of high finance, wealthy manufacturers, doctors with seared consciences, ex-ministers, and wealthy fathers and husbands high in social influence have furnished three-fourths of the capital, (according to reliable statistics to support the ultra elite 80,000 demi monde, in addition to the 40,000 street women of the metropolis.)

From now on wealthy husbands and fathers from our neighboring cities can no longer, without danger of legal penalty, insult their heart-broken and dependent wives thus—"Kate, if you would behave yourself and let me alone, I could have Miss—, in my office and entertain my friends in my own home, but you prefer to always interfere in my business and social life; therefore I am obliged to keep Miss—, in New York and have my social enjoyments where you cannot interfere. If you would attend to your own affairs and let me alone, I would give you all the money you want for the house, children and everything else." Should not every lover of purity in family relationship rejoice that the former license of infamy is legally at an end? Our law will help every state in the Union.

Legal responsibility of fatherhood out of wedlock, is both practical and desirable that rational responsibility of fatherhood in wedlock be exemplified. This law will aid the church to divert a portion of its interest from establishing homes to rescue young fallen girls. Wealthy fathers who are heads of families have been sorely neglected by the State and Church in the past, and some of us realize the need of rescue work being done among capitalists who are high and powerful in social and financial circles as well as devoting all energy to the salvation of young, ignorant girl victims. The soul of a masculine high financier is just as valuable as that of his little milliner girl victim.

Some of the daily newspapers have designated our Infidelity Bill, "the anti-divorce bill." The mission of this law for the diminishing of divorces is not by any means its chief object, which is to make infidelity in wedlock a legal misdemeanor punishable by imprisonment, or fine, or both.

New York State has had no law making infidelity in marriage a crime or misdemeanor for more than sixty years. The National Christian League for Promotion of Purity will send any person desiring it, *a copy of the law on infidelity of every state in the union*, who will send their address to our headquarters, 5 East 12th Street, New York City.

Delaware, Louisiana and Idaho will no longer be able to associate the Empire State with themselves for having no legal penalty for infidelity in wedlock. During our strenuous efforts for the past decade not one individual lawyer, doctor, ex-judge, minister or ordinary laymen has ever given one encouraging word that this bill would become a law. Hundreds of just such people have said to me times without number each winter, "You are making a splendid effort, God speed you! Agitation is good, but you will never succeed. You will have to wait for the millennium. How can you believe that legislators are going to make a law for your asking, for their own conviction?"

Many and many a man has declared personally to me that if there was real danger of this bill becoming a law he should feel obliged to go to Albany and plead against it because the result would be the breaking up of half of the families in the State. Quite a serious comment on family life!

If there were time and space hundreds of incidents connected with the securing of this law could be told which would awaken public interest to facts which could not readily be credited. I wish every person in the United States might learn of this legal victory for the defense and uplift of legal monogamic relationship in every state as well as New York.

One of the splendid results of this law is that no husband can boast from now on, in the presence of his children, to his wife (if she is a woman of spirit,) of illicit relations, offering all proof that she may apply for a divorce which in such cases is a reward to the criminal and punishment for the innocent.

Which class of people of both sexes are in the minority at 40, 50 and 70 years of age—they who regret the sowing of wild oats (so-called) in their early manhood and youth, or they who regret their self-control of fleshly temptation of physical enjoyment in sin for a season? We do not need to accept the answer of any easily dubbed "superstitious fanatical Christian."—A large majority of men, strictly of this world, will wail out the honest reply—"Oh, that I had known the horrible judgments meted out to me in my body for indulging in the pleasures of sin for a season."

\* \* \*

"Go wing your flight from star to star,  
From world to world, as far  
As the universe spreads its flaming wall,  
Count all the stars and all the spheres  
And multiply each by thousands of years.  
One moment in heaven is worth them all."

—Moore.

# Snowflakes

H. M. Foglesonger

A VERY common subject, indeed, is snowflakes. It does not necessarily lead you into a remote part of the earth nor does it have the least smack of sensationalism; but the study of snowflakes is really fascinating. The writer has been interested in the tiny structures for sometimes and they have been the source of a great deal of pleasure. The amateur will find help in his researches in the new International Encyclopedia and in the writings of A. Bentley of Vermont; but by far the best way to study the snowflakes is to get out in the snow and see for yourself. You need no other apparatus than a small magnifying glass, which is not absolutely necessary however, and you need not take a day off either. A good way is to watch the flakes when they fall on your coat sleeve as you walk

Those branchings vary from the most simple to the very complex, and the center is often made up of concentric designs.

You may find small crystals of three sides and of irregular designs, but the latter have become modified in their flight. Often one fan is broken off and the remaining ones pushed around so that it looks like a five pointed star. These must not be mistaken for original crystals. As was said the designs are numerous. The larger crystals may be divided into two classes, one having a more or less large and complex center and the other having scarcely any central structure. The center is usually a hexagon with one or two smaller hexagons within. The outlines of these hexagons are then united by other lines radiating from the center. You can readily see how almost innumerable variations in this design may occur. The branchings and structure of the points vary from the leaf like style of fig. 3 to the plain conventional style of fig. 2. Nature is surely an artist and our painters and decorators will search a long time before they find more beautiful patterns than these tiny snow crystals. Figures four and five represent the smaller kinds and are merely thin plates of varying internal structure.

The snow crystals follow certain general rules. The crystals of one snow are usually of the same or similar design and the lower the temperature the smaller they are. Simpler designs are usually found during low temperatures also. But the higher stratas of air are colder and flakes coming from high altitudes may be very greatly varied by warmer and lower stratas of air before they reach the earth. Figures (1) and (3) are thus modified and figure (4) is very slightly changed. In a wide spread storm the crystals are generally smaller and simpler in design.

During January of this year there were two successive snows in this locality of which the crystals were like figure (1). They were all fashioned in the same way. But the next snow had something new, for the crystals were like figure (3) only there was no center. The six leaf like branches united at the center so that a beautiful six pointed star was formed. But later the full figure (3) came and soon it was enriched by compound branchings.

Figure (2) is an unusual style and not often seen. During the early part of the winter I saw flakes of that design without the secondary branchings but a few days ago a small snow fell here in which a large percentage of the flakes were exactly as represented in the drawing. At the time I had no magnifying glass with me and could not work out the central design so well.

along the street. The writer has made many observations while watering the horses and if the horses' coat be black you can have no better place to see them. The flakes fall on the horses' hairs and are not broken and you can view them from all sides.

What we ordinarily call a snowflake is a fluffy bunch of tiny crystals all tangled together, hence to understand a snowflake you must study the individual crystals. Some claim that there are as many as one thousand different designs of these crystals but not nearly that many have been drawn or photographed. From the accompanying five figures you gain some idea of how the crystal is formed. In general they have six sides or branches radiating from a common center.

This morning Jan. 27th, we had a most interesting snow. The crystals broke away from the usual regulations and came down in many figures. It was a veritable exhibition of beautiful patterns. The simplest were tiny plates like fig. (5). Some had central designs like fig. (4) and others were plain. Besides there were many kinds of beautiful stars, with the most delicate lines and branchings. The radiating needles seemed to be a kind of halo about the concentrically designed body of the crystal. I wish time would have permitted the drawing of every one for you. I studied several under a magnifying glass and it was hard to say good-bye to the little pictures as one after another they gave up to the warmth of my hand and melted. Each one was so beautiful. They would come down singly, in pairs and in threes and sometimes in a whole jolly group they would pounce down upon me. The little fellows would hang together but the bigger ones would risk the flight alone.

The dark lines in the crystals are minute air chambers but the delicate shadings which can be seen only in the real crystals must certainly be due to the varying thickness of the crystals or perhaps to the structure of the minute particles. Snow is white because all the rays of light are reflected into the retina of our eyes. Light shining through a prism will be divided into many tints and shades. The combination of all these colors is required to make white light and when an object is green only the green light waves are reflected into the eye. The snow crystals are so formed that all the waves that go to make up white light are reflected into the eye in a mass.

For assistance in making the accompanying drawings recognition is due to the photograph of A. Bentley.

### THE EARTH'S SEVEN WONDERS, OLD AND NEW.

ARE these seven wonders of today as wonderful as the seven wonders of the ancient world:

New York's forty-eight-story building.

The 30,000-ton steamship Lusitania.

The transatlantic wireless telegraph now in operation.

The war airship under trial by several nations.

The electric locomotive, replacing the steam locomotive.

Edison's cement house that can be built in a few hours.

The camera-phonograph.

These are not the seven "modern wonders of the world," but they are the seven newest wonders—they are all developments of the year 1907 A. D. They certainly hold down their side of the scales against the seven wonders of 907 B. C. They are all innovations, unprecedented, prophetic of future wonder-develop-

ments. They all indicate material progress, and are typical of the "commercial" spirit of the times.

The seven ancient wonders weigh heavily in the balance against anything that has been produced during these modern times. They were wonderful for any age, and in their line modern civilization has not surpassed them. Of all the seven only the Egyptian pyramids remain and the ruined foundations of the walls of Babylon. Few of them were altogether materialistic. The pyramids, the mausoleum erected by Artemisia, the temple at Ephesus, the statue of Zeus at Olympia were religious, and as typical of the spirit of those days as are the great ships and skyscraper buildings of the spirit of today. The pharos, or lighthouse, at Alexandria, and the colossus of Rhodes were great works that might come from the genius of any age.

### FOOLSCAP PAPER.

SOME two hundred years ago there was a civil war in England, in part growing out of a disagreement among the people about the kind of religion they ought to have. The king, Charles I, and his followers were on one side, and Oliver Cromwell, with the king's opposers, on the other side. Cromwell was successful, and the king was executed. Then Cromwell became head of the government, and he had a liberty cap made as a stamp for all the government paper. When the royal family had regained the throne, it happened that King Charles II wanted to write a letter. They brought him some of the Cromwellian paper. He noticed the stamp, and said, "What is that in the corner?" When he was told, he flew into a passion and said, "Take it away. None of your foolscap for me!" This bit of history will make you understand why one class of paper has so dull a name.

### A STUDY IN WORDS.

EXPLAIN the exact difference of meaning between:

1. Avenge and revenge.
2. Avaricious, covetous, miserly.
3. Behavior and conduct.
4. Beseech, entreat, solicit, implore.
5. Blameless, spotless, faultless, stainless.
6. Care, anxiety, solicitude, concern.
7. Communicate, impart, reveal.
8. Egotism, self-conceit, vanity, egoism.
9. Imagination and fancy.
10. Liberal and generous.
11. Profuse and lavish.
12. Auspicious and propitious.

### IS IT TRUE?

A little nonsense now and then  
Is relished by the wisest of men.

# Homestead Life in New Mexico

James M. Neff

My father was never noted as a gunner nor did he encourage his boys to try to acquire skill in the huntsman's art. It was not uncommon for him to "take to the woods" with us, however, but it was usually to pick brush, roll logs, saw wood or tend the sugar camp. The valleys of the Wabash and its tributaries had been sufficiently reclaimed from a wild and savage state when I entered upon the stage of action, that there was little left to appeal to a boy's love of romance and adventure.

Notwithstanding this fact it was one of the dreams of my boyhood that I would one day live alone in the fastnesses of some forest with beasts and birds as my companions; and there was no pastime in which I took greater delight when with my playmates than that of playing Indian."

Had I lived a generation earlier I would probably have sought the companionship of Daniel Boone or Davie Crockett, but as they had gone ahead and encountered the Indian and killed all the bear before my advent, I sought in books the seclusion which I otherwise might have found in the woods.

Being somewhat inclined to become an enthusiast in any line pursued, I so gave myself to school and books that before I had passed my majority many years, failing health drove me to the open. And if my tactics in recent years have been those of retreat, it has been in flight from "the great white plague," and in this flight I have sought and seen much of God's great outdoors.

I have chased the deer and the "razor backs" of the pine forests and played with the alligators of the cane brakes and swamps of the Gulf coast; I have crept thru the brush and climbed the mountains of North Carolina, Tennessee, Kentucky and Virginia and thot about the bear and panther that many people talk about but few people see in recent years; I have wagoned across the plains of the Southwest and among the mountains of New Mexico, hearing the scream of the wild cat and hoping to see the bear that President Roosevelt didn't kill; and had my good wife enjoyed rocks and mountains and romance as well as I, it is possible we would not be "out of the woods" today.

But as this trend of events has so run that we have passed thru the experience of life on a homestead out on the plains of New Mexico. And let me tell you, when a man gets housed in a little cabin out on the plains with nothing in sight but grass and sky and out of doors; when the sun gets low in the west and he hears the drum of the blue partridge, the call of the curlew, the bark of the fox and the coyote's

howl, if he ever "played Indian" when a boy, his wild nature all comes back to him and he begins to think about his gun. The two cuts accompanying this article will give you some idea of how the "wild nature" came back to me.

As I trudge across my untitled "claim," still wild as nature made it, suddenly a jack rabbit leaps from his hiding in a cluster of mesquite and bounds away at such a rate of speed that if my gun were on my shoulder he would soon be out of danger; but my gun is not on my shoulder; it is down in front of me, held in both hands, ready to be raised into position for action, and hence at the crack of the discharge his jackship turns a double somersault as he runs and falls? to rise no more. I take my ax and uproot a tree cactus and drag it up alongside a sharp-bayoneted yucca in such position that the space between can be entered from but one direction. Back into the angle thus formed the carcass of the jack rabbit is thrown as bait. In front of this is carefully concealed a heavy, double-spring steel trap. I had been to "the brakes" a few days before and brought a few

poles (a rare article often on these New Mexican plains) and to one of these, about five inches in diameter, the trap is chained.

Then the sunset is followed by the brief New Mexican twilight and soon darkness is settled all about us. That night the coyotes howled loudly all about us. Next morning I was up and out in the early dawn, across the plains after the bronchos that I might get

an early start on my nine-mile trip to town. As I came near the yucca where the trap was set I saw that the arrangement of things as I had left them the evening before was somewhat changed. I looked again and discovered that the trap was gone. I

looked again and I saw that the pole had been dragged away. "There's been some big game here," I said to myself, and then I looked cautiously all about me. I could not see far thru the dim light, and everything was still.

I imagine, now as I think of it, that my eyes were big. If you had been there and looked into my face, there is just one thing that would have kept you from laughing, and that is, you would probably have been as much interested in the game as I was. I argued to myself: "He certainly would not have gone far with that trap and pole. I'll likely find him not far away." I stepped out a little way and walked in a circuit about the yucca, looking cautiously in every direction. I saw nothing. All was still. I walked farther out and started around in a larger circuit, and when about half way around, I heard the rattle of the chain; and as I heard it, a succession of chilly tremors crept up my spine. I peered again through the meagre light and saw a large grizzly-coated coyote crouching behind a cactus.

It was not far to the house and I ran for the gun and arrived with scarcely breath enough to tell my wife what I wanted. You have heard say and many of you have experienced that the higher you get and the lighter the air, the more difficulty you experience in breathing. Well, the altitude was high that morning, unusually high, as it seemed to me.

But the coyote, as large in body as a good-sized shepherd dog, but standing higher from the ground, was soon dispatched, dragged to the house, hanged by the hen house as you see him in the picture, and the hens sauntered about, stared, and cackled thanks to their stars that they were yet alive.

Look at the other picture. In my hand I hold a fox, or, as we call him in New Mexico, a "swift." In color he is rather between a red and a gray fox, not large but as sly perhaps as any of his kind and with an appetite for fowl equal to that of a Methodist preacher. At the top and to the right of the picture a badger skin hangs against the house. Of course I need not explain that the black furs are those of the inevitable, odoriferous, everywhere-present skunk. Above the window are the pelts of some jack rabbits whose carcasses made fresh meat diet for the hens. Back of me and hanging against the tent (which served as our bed room while living on the homestead) are the skins of several "swifts."

See that hole in the ground at my feet? That's the cellar window. Were I to take you into the house, raise the trap door and conduct you down the stone steps into the cellar and show you my fruit, you would forget for the moment the presence of the wild man of the west and realize that there is more than one side to life on a New Mexican homestead.

*Clovis, N. M.*

\*\*\*

#### THE ARMY IMPERILED.

For several years past the War Department has found increased difficulty each year in securing recruits to keep up the required numerical strength of the army. Some navies of the world use twice as many men per battleship as the United States does. In fact, while the United States ranks second in the naval equipment of the world she ranks fifth in the number of men employed. It is said that the fleet enroute to the Pacific was very sparingly manned, because of lack of naval recruits, while the army is below its legal status about twenty-five per cent.

Now to revive military enthusiasm and enlarge our standing armies with young men there is a move on foot to appeal to the colleges and universities for recruits. The school authorities would not want to show themselves disloyal because they depend upon public patronage, hence they would likely join in with any popular wave that pretended to be for the national benefit. The universities and colleges aggregate the largest bodies of young men to be found anywhere, hence this would be a fat place to work.

The friends of peace ought to organize to combat and offset any such a movement, for if militarism once dominates our schools as it does German universities, then we may expect duelling to be practiced by our children just as it is in Germany. It is easy to disbelieve this report and go to sleep over it, but some means will be found to keep up our army and navy if our college halls must be invaded. The friends of peace have a work to do if they want their convictions to bear fruit.

## CURRENT COMMENTS

### SUIT AGAINST THE HARRIMAN ROADS.

Relying on the information gained during the Interstate Commerce Commission investigation of the Harriman railroads last year, Attorney General Bonaparte has brought suit under the Sherman Act to set aside the control by the Union Pacific Railroad Company and its subsidiary corporations of the Southern Pacific and the San Pedro, Los Angeles & Salt Lake Road; and to have declared illegal the ownership by the Union Pacific or the Oregon Short Line of stock in the Santa Fé, the Great Northern and the Northern Pacific, on the ground that all these lines are competitors of the Union Pacific. In the present suit, the Government holds that the Harriman interests have a substantial monopoly of the transportation business of the country between the Missouri River on the east and the entire Pacific coast south of Portland on the west. It is reported also that no suit is to be brought on account of the manipulation of the Alton Railroad, by which the public was practically cheated of millions of dollars, which went into the hands of the men who held control of the road. During 1901, Harriman as head of the Union Pacific began to get control of the Southern Pacific, which controlled a line from New Orleans to California and Portland Oregon. Since 1902 a majority of the board of directors of the Southern Pacific have been members of the board of directors of the Union Pacific. "Competition between the two companies," the Government charges, "has been substantially eliminated." The San Pedro, Los Angeles & Salt Lake Road, which runs from tidewater on San Pedro, California, to Salt Lake City, was projected by Senator Clark as an independent road. But the Harriman interests, by means of threats, induced him to make the new road practically a part of the Harriman system. The Harriman interests have also acquired a large amount of Santa Fé stock, and two directors of the Union Pacific, Frick and Rogers, are also directors of the Santa Fé, altho the two roads would naturally be competitors. The Oregon Short Line, one of the subsidiary companies in the Harriman system, held, Jan. 30, 1907, twelve million dollars of stock in the Great Northern and six million dollars of stock in the Northern Pacific, the the Government holds both the Northern roads to be competitors of the Union Pacific. Attorney General Bonaparte holds that the Harriman roads present a situation analogous to that of the Northern Securities Company. The Government won the former case, and compelled the Great Northern and the Northern Pacific to separate their ownership, but it is generally understood that there is no more competition now between the roads than there was before the Northern Securities Company was dissolved. How competition would be created between the Harriman roads, in case the present suit is successful, does not appear. The Government case is to be in charge of Frank B. Kellogg and C. A. Severance, who were the attorneys of the Interstate Commerce Commission in the Harriman investigation last year.

### INTERNATIONAL MARRIAGES.

The notice given by the public press to a recent international marriage, especially the amount of space taken

by the more particular "Palladia of our liberties," those journals which make so much of the "common people" is, in one aspect, thoroly amusing. But, tho the fact that the New York "American" should spend three and a third pages on a wedding between a foreign count and a young American lady is laughable, it is a sign also of a very serious distortion of vision. Why is so much space given to the wedding? What had the groom done, or what had the bride done to make them people worth paying any attention to? Nothing. There is many a teacher in the public schools, many a young charity worker, many a young writer, yes, thousands of stenographers and clerks, to whose weddings not an inch would be given in the public prints, but who are of far more value to the community than the young women whose marriages are made the subject of columns. It is a very serious matter that the vision of most Americans, as witnessed by the papers, is thus distorted. We must judge people by the amount of service they render. The most effective way to bring men and newspapers to judge by that standard is to hold up to ridicule those who do not. In regard to international marriages a Representative from Illinois has introduced into Congress a bill providing for a tax of twenty-five per cent on the dowry of American women who marry foreigners, and an Assemblyman at Albany has introduced a bill to levy a tax of twenty per cent on such dowries or settlements. Representative McGavin, of Illinois, recently, made a speech on the federal bill which called forth laughter and applause. In the course of his speech he said:

"I was curious to know whether the present tariff schedule included dukes, lords and counts, and finding that the things were not here mentioned, I thought that it might be proper for the customs officer to classify them like frog's legs, as poultry, for it is the general opinion among Americans that they are a species of geese. Mr. Chairman, we upon this side of the House, have in recent years referred triumphantly to the fact that, as between this and other nations, the balance of trade was in our favor, but nowhere in the summary can be found a reference to such trade as these, where soiled and frayed nobility is exchanged for a few million American dollars wrung from the lambs of Wall Street with a woman thrown in to boot. There was a time when wealthy Americans traveling in Europe were contented with buying costly fabrics and paintings, by "old masters," of whom they knew nothing, but now they want something even more costly but less valuable; so, when the wealthy girls traveling with their parents abroad see some remnant of royalty they enthusiastically exclaim, 'Oh, mamma, buy me that!' An interpreter is secured, the bargain is made and the money produced, and the girl is gone, soon to return a sadder but a wiser one. While I have engaged in some criticisms of these particular ones who have made a mockery of the most sacred relations of life—of these not satisfied with any other name but Countess Spaghetti or Macaroni—I want to say one word in tribute to those true American women who spurned the wiles of earls, lords and counts for the love of his majesty, an American citizen."

### A GERMAN'S VIEW OF THE AMERICAN WOMAN.

Mr. von Brandt, a German scholar, traveller and writer, speaks thus of the American woman:

"There are, however, two peculiarities to be found in American girls. Whether born or merely brought up in America, they evidence the same independence of judg-

ment, and the same complete self-reliance. It is hard to say whether this is the result of the education in public schools and in the coeducation of colleges, or in their freedom from that condition of legal and social subservency to which the gentler sex is doomed in older countries. It is with us most frequently the case that the female members of the family are occupied with providing for and looking to the future, while the men are making provision for the present, its needs and its expenses. Such a thing is inconceivable in the United States. Here the number of girls and women who make their own living is ever increasing.

"In reality the American women are as specialized by descent, education, locality, and climate as are the dwellers in separate provinces of other countries. Every American man, and still more every American woman, are different from each other according as they live in New York, Boston, Chicago, San Francisco, Baltimore, New Orleans, or other cities, just as the Germans are according as they live in Berlin, Hamburg, Cologne, or Munich.

"It can not be doubted that the life led by young girls in colleges and universities is nothing more than what the Americans call 'having a good time,' a time, however, which they gladly give up on any opportunity of obtaining an occupation."

He concludes by reviewing the question of "race suicide," due, he thinks, to "the love of a free life, the self-will, the hatred of responsibility, of the cares of a household, which distinguish the American girl." This same spirit accounts, he declares, for the frequency of divorce. Independence and love of liberty, he thinks, is about all girls learn in college.

#### THE FAILURE IN FIRE-PROOF BUILDINGS.

The term skyscraper has become synonymous with fire-proof buildings of late years, but a recent fire in one of these fire-proof buildings, in New York City, has caused many doubts as to the ability of these tall buildings to withstand fires, because in the instance under consideration the entire building became a wreck, altho the building proper, both floors and walls, was constructed of fire-proof material.

The failure in calculation comes from the fact that a building whose floors are crowded with flammable material soon generates such a heat that the steel braces, girders, and connections lose their tensile strength and give way under their immense weight, and if one or two of the upper floors fall, the combined weight then crushes the next floor, and so on until the whole inside of the building lands on the bottom floor, where the fire and crash together completes the ruin.

It is safe to say that very few, if any, fire-proof buildings are in existence yet, altho much improvement has been made in this direction, and since buildings 600 feet high are being built, it becomes imperative that they be made fire-proof, because firemen cannot fight a fire at such a height.

#### THE ILLEGALITY OF THE BOYCOTT.

The second of the decisions limiting the rights of labor unions was rendered in the case of Loewe & Co., hat manufacturers of Danbury, Connecticut, against Martin Lawlor and two hundred other members of the United Hatters Union of that city. In this case the Supreme Court unanimously decided that the boycott was illegal, on the ground that it was a combination in restraint of trade within the meaning of the Sherman anti-trust law.

As in the Adar case, the Supreme Court overturned the decision of the lower courts. The Danbury hatters asked Loewe & Co. to unionize their factory. Altho of eighty-two hat manufacturing concerns in this country, seventy acceded to the demand of the Hatters Union, Loewe & Co. refused. In order to force them to yield, the Union which is a part of the American Federation of Labor, declared a boycott, which was announced in the official organ of the American Federation, and was enforced with the help of the Federation organizers, numbering one thousand, according to the plaintiffs. Loewe & Co., which has a yearly output worth \$400,000, estimated that it suffered a loss of \$80,000 worth of business on account of the refusal of the labor unions to buy its product, and under the section of the anti-trust act, which awards to the complainant three times the amount of damages sustained by a combination in restraint of interstate trade, brought suit against the Danbury Hatters' Union for \$240,000. The boycott affected the plaintiff's business in many places outside of Connecticut, notably in San Francisco. The court ruled that the combination charged fell within the class of restraints of trade which aim at compelling third parties and strangers involuntarily not to engage in the course of trade except on conditions that the combination imposes. The case will now be retired in accordance with the law as laid down by the decision. Loewe & Co. have already attached \$180,000 worth of property which belongs to members of the Hatters' Union in Danbury, and which will be forfeited if the trial court decides that the company suffered in the amount of even \$60,000 from the boycott. The American Federation of Labor is said to be maintaining a boycott against some one hundred and fifty other individuals and firms. The decision greatly limits the fighting powers of the unions.

#### CARING FOR EX-PRESIDENTS.

A bill in Congress provides that future presidents of the United States shall, upon the termination of their offices, become representatives to future International peace conferences. In the past there has been no suitable occupation for ex-presidents altho they were well equipped to handle international matters.

The step is in the right direction and we trust to see it become a law. It would be the nucleus for an international board that could plan and act in the interest of adjourned conferences. If these world congresses are to become permanent and productive of good they will need to delegate their powers into the hands of some board so that erstwhile questions could be settled at once and not wait until the full congress convenes.

#### STANDARD OIL HARD HIT.

The decision of the United States Supreme Court in which the court held the Elkins law to be valid and not repealed by the Hepburn act, knocks away one of the pillars on which stood the appeal of the Standard Oil Company of Indiana from the conviction and record-breaking fine obtained in Judge Landis' court.

"This decision is of vital importance in its bearing on the Standard Oil case," said Mr. Sims. "The validity of the Elkins law, under which the fine was obtained, was the chief point of the defense in the appeal that was taken to the United States Circuit Court of Appeals. This point removed, there seems to be little doubt that Judge Landis' big fine will be affirmed by the Court of Appeals. The appeal will likely be argued early in the April term of the court."

# THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## LEARN TO TRUST YOURSELF.

It is a good drill for a young man or young woman to be forced to rely upon themselves in financial, educational, and social matters. The boy, who in school always depends upon some one else for help will weaken, day by day, until at the end of his course he will be totally helpless and disqualified for any position of trust.

To support one's self, even if the progress is slow and the way marked with failures will, sooner or later, develop a strength of character that will draw patronage and respect. It is often an act of kindness for a teacher or parent to withhold help until the child's resources have been exhausted, and then the help should come, not in actually doing the piece of work, but, in directing the youth in his own endeavors.

We select the following from Henry Wallace:

"Learn to depend on yourself, not merely in mastering the studies of the year but in everything else. It does the boy no good to have things made easy for him at home or away from home. His future success will depend on the character he develops, and no agency can develop that but himself. The boy or girl for whom things are made easy at home and in school will usually be soft in fiber, mental and moral as well as physical.

"The teacher, professor, or lecturer is not doing you any kindness in making it easy for you; and the schoolmate who tries to make it easy for you by helping you out when you are behind through laziness or lack of application is no friend of yours. If you are to get any good whatever out of your studies you must dig them out for yourself. The problems may be hard, but whether hard or easy, solve them. Go at things with a grim determination that you will know all there is to be known on that particular subject. If you keep that up even for one year it will give you moral and mental fiber and lay the foundation for usefulness in your future life."

## A CORRECTION FROM PROFESSOR HARNLY.

ON page 91, under the heading of Our National Wastefulness we gave some figures as they were used by the Geological survey. The statement, that since \$200,000,000 of the \$600,000,000 San Francisco fire was paid by insurance companies the country suffered a loss of only \$400,000,000, was challenged by Prof. Harnly, of McPherson College, Kans. He claims that had the entire \$600,000,000 been paid by fire insurance companies the loss to the country would have been just as much—that is, that a fire is a loss regardless of how much insurance companies may restore.

The Prof. is absolutely correct in his conclusion, for should a vessel sink in midocean with \$10,000,000 gold on board, this amount of loss could in no way be restored by the insurance which the steamship company carried on their vessel and its cargo. Yes, the San Francisco fire lost the country \$600,000,000, and the government calculations were erroneous.

## FORWARD MOVEMENTS.

It does not take much brains to find fault. There is so much about us that is inferior that a person could spend all his time lamenting. But this yields no personal profit to the person or strength to his cause. We want remedies—something that tones up the body politic and produces fruit. Something constructive, and not wholly destructive. This is the kind of blood we want in our magazine—something that dispenses health and activity week after week as the pages are read. Something real and practical.

## TESTIMONIALS.

"OUR INGLENOOK, good from its birth, grows better and better week by week." Nancy D. Underhill, Colorado.

"WE wish to congratulate you on the improvement of the INGLENOOK. It is now a very interesting little magazine, and one of which we may be proud, when we say it is 'our magazine.' We have heard the same feeling expressed by some of our other missionaries, as to its improvement. And we believe it will continue to grow."—Effie V. Long, India.

"'TIS growing in value."—Emma Horning, Colorado.

"THE INGLENOOK is continually progressing."—Richard Seidel, N. J.

"I AM sure that your paper has a place in our American world of magazines. For it not only 'preaches clean literature,' but what is far better, it 'prints clean literature.'"—Wm. L. Judy, Pa.

## THE MURDER.

J. O. BARNHART.

"Good-bye, sweet ones," the mother bird said,  
As she roused her little ones from their bed,  
"I must go and look for your daily bread."

And the little ones all were happy.

"Good-bye, good-bye, you must all be good,  
Till I bring you your breakfast from the wood."  
And they all said, "yes," for they understood,  
And the little ones all were happy.

"And when all my darlings have been fed,  
And tucked again in your nice warm bed,  
I must look for your papa, then," she said,  
And the little ones all were happy.

"'Tis three days since he went away,  
I wonder so much what makes him stay,  
I am so lonely all the day,"  
And the mother was very unhappy.

"Good-bye, good-bye, till I come again,  
And bring your food from the forest glen,"  
And they answered, "Good-bye, good-bye," for then  
The little birds all were happy.

Yes she flew away but she never came back,  
For the cruel hunter was on her track,  
And every time his rifle cracked,  
The hunter, he was happy.

Where she dropped to the ground the sod was red  
With her dear heart's blood, as she fell down dead,  
"Farewell, dear birds," was the last she said.  
But the hunter he was happy.

He put her in a blood-stained sack,  
He always carried upon his back,  
And every time his rifle cracked,  
The hunter, he was happy.

He carried her off with a hundred more,  
To the city, unto a market store,  
Whose sign was a dead bird over the door,  
And the hunter, he was happy.

The merchant, he laid them all away  
With a thousand more he'd bought that day,  
And he laughed, "ha! ha!" as the price he paid,  
For the merchant he was happy.

But the little birds left alone in the nest,  
They cried till the sun went down in the west,  
And longed for their tender mother's breast,  
All lonely and all unhappy.

And under the stars they cried and cried,  
And perished of hunger side by side,  
But God beheld when the orphans died,  
All sorrowful and unhappy.

And the mother bird found the father that day,  
As in the merchant's dark cellar she lay,  
But he too was dead, and he could not say,  
Why he left them all unhappy.

He could not stay, but the hunter could tell,  
For he knew the spot where the father bird fell,  
And his rifle's sharp crack was the funeral knell,  
That left them all unhappy.

But who was to blame for the slaughter and sin,  
That made the hunter and bird-seller grin?  
Who is it fills their pockets with tin,  
And makes them all so happy?

Is it the milliner over the way,  
Who decks all her windows with great display  
Of bonnets and birds in such splendid array,  
While young birds are left unhappy?

Is it the milliner? No, ah, no,  
Those bonnet-trimmed windows are not just for show,  
She makes the bird-bonnets to sell, you know,  
And it makes her very happy,

To see her customers pleased so well,  
For all of those wonderful bonnets she sells,  
And who are the customers, can you tell,  
That make the milliner happy?

If you do not know, why, then you ought,  
For one of those bird-trimmed hats you just bought,  
And so long you had tried and so long you had sought,  
Ere you found one to make you happy.

But when you beheld it you did not see  
The kind mother bird and her children three,  
In their warm cosy nest in the maple tree,  
And all so glad and happy.

You never could guess how the little birds died,  
You never could know how long they cried,  
And suffered to pamper your foolish pride,  
And perished so unhappy.

But it was your money that paid such a price,  
The price of their blood, not just once or twice,  
And you thot, yes you thot they were all so nice,  
And seemed so glad and happy.

But the one that you bought was only just one  
Of thousands of thousands, all killed with a gun,  
Of the hunter who doesn't just do it for fun,  
He does it to make **you** happy.

And hundreds of hunters are doing this thing,  
All over the land every day in the spring,  
For they know you will buy all their plumes and their  
wings,  
And be so well pleased and happy.

But the very next time you remove with such care,  
That exquisite hat from its box to wear,  
Just tarry a moment, a moment while there,  
While you are so glad and happy,

And ere that most lovely creation you try,  
You who would never harm even a fly,  
Just look that dead bird, that dead bird in the eye,  
Whose orphans were left unhappy.

Behold with your eye, and then hear with your ear,  
And while the sad cry of those orphans you hear,  
Then turn to that God whom you claim to revere,  
Who made all his creatures so happy.

And ask him to help you to merciful be,  
And may you live long all his goodness to see,  
In field and in garden, in flower and tree,  
Then will all his creatures be happy.

And with his blest children may you, too, enjoy,  
The time when they neither shall hurt nor destroy,  
And never shall care, grief, nor anguish alloy  
The seasons that pass all so happy,

And thru boundless realms of beauty so rare,  
We'll soar like the birds free from fear and from care,  
And dwell with the righteous in mansions so fair,  
And be ever glad and happy.

Chesterville, Illinois.

## What Books Shall We Read

Luella G. Foglesanger

### WHAT BOOKS SHALL WE READ?

LUELLA G. FOGLESANGER.

WE are usually careful about the selection of our friends, and well we should be, but we are usually not so careful in the selection of the books which we read. We should shrink from associating with a person who was uncultured or unrefined, yet we will not hesitate to pick up a light trashy book, and read it just for pastime, or to rest the mind after study. It would be better for both the moral and physical nature, if this time were spent in the fresh, open air taking exercise of some kind. The mind would thus be restored to its normal condition, and no evil effects would result.

Many writers cannot conceive great and good characters, they are not capable of portraying noble men and women, so they content themselves with creating mediocre characters. Their characters are swayed by ruling passions, usually the passion of love, and there is nothing inspiring or uplifting in them. The author who writes trashy literature and publishes it, scattering it broadcast over the land is committing a greater sin than if he gave his readers so many grains of poison. By doing the latter he is simply poisoning the body; but by the former he is poisoning the soul, that, before, was pure and spotless. Boys and girls have been lost morally, thru the reading of one single bad book.

The period between 16 and 25 in a young man's life and between 16 and 21 in a young lady's life is the critical period. This is known to be the adolescent period. The adolescent mind is filled with hopes, dreams, tempestuous passions, and religious ideals. Excitement and amusements are necessary at this period to satisfy the inward cravings of the soul. It is at this time that the individual comes into the highest powers of the body, and also of the highest powers of the soul. He is sensitive to all moulding influences; he is an idealist; he is a hero worshiper—a hero worshiper almost as great as Carlyle himself. Ideals are formed largely by the books read during this period. If we read detective stories, stage coach robberies, cheap love stories, blood-curdling ruffian

stories, our ideals will be the heroes and heroines of these stories. We endeavor to be like them and prove to be so to the sorrow and disappointment of our friends. Deforming the body is nothing in comparison with deforming the soul; and just as the body of the child is most easily deformed before the age of five, so the mind during the adolescent period can be most easily deformed and injured. How careful then we should be in the selection of our reading material at this time.

Thru the boy and the girl surges the desire to be, to know, to feel all that is highest, truest, best. They may keep their aspirations hidden from even their nearest friends but their souls are filled with dreams of perfection, even of suffering that they may rise to higher levels. It is now that the boy and girl should read Sir Walter Scott's Historical Novels, the embodiment of action, of chivalry and of high ideals. His *Ivanhoe* is a vivid picture of the knight and castle; his *Talisman* revives the days of the Crusaders; his *Kenilworth* gives us a glimpse of the brilliant days of Queen Elizabeth; in his *Old Mortality* we are introduced to the grand old Scotch Covenanters. These books are all intensely interesting and appeal especially to the boy in the adolescent period. The history in these novels is not always accurate, but it has been said that altho the hair lines in Scott's pictures may be neglected, most persons can learn more truth from studying his gallery of historic scenes than from poring over volumes of documents and state papers. It is in the adolescent period that Dicken's characters seem most real and life like. Little David Copperfield seems so companionable and quaint, and we weep over little Oliver Twist's hardships and sufferings. It is now his Christmas carols seem most exquisite and pathetic. Dickens awakens philanthropic desires, a love for those less fortunate than ourselves. He broadens our sympathies, and since we are most susceptible to these influences while we are young, we should read his works for their elevating tendencies. If we want something humorous, turn to his *Pickwick Papers* and spend an hour or so with Sam Weller. A good hearty laugh over Sam's awkwardness, stupidity

and wit will do any one good. The pages of Dickens are unsullied and he instructs, amuses and ennobs. Become better acquainted with him.

It is so important to cultivate a taste for good classic literature. Some people go thru life believing that all literature bearing the classic stamp is dry, heavy and uninteresting. It is simply because they have read the wrong thing first. If you give a boy of fourteen "Ruskin's Seven Lamps of Architecture" to read he will not appreciate it. If you follow this up by giving him "Wordsworth's Intimations of Immortality," or George Eliot's "Romola," he will be disgusted with it all. He will form a dislike for good literature and look for something ordinary and full of life. Give him Fenimore Cooper's "Leather Stocking Tales," and he will devour them one after the other. He will go romping thru them as a young horse in a new pasture. Our greatest writers have given us plenty to suit all ages and conditions, and if we do not like their works, it is simply because we have not found what suits our age and temperament. Literature is the best that has been thought and felt by the race,—then why not make the acquaintance of these great souled men.

We can all cultivate a love for poetry if we begin by reading some of the simpler ballads. Any one can enjoy Shelley's "The Cloud," "To a Skylark," and "Ode to the West Wind," Burns', Longfellow's, Whittier's and Lowell's poems. Some one has said that poems are simply the lessons poets learned from life and which they sing to all generations. Their souls are often laid bare and we see and understand them better sometimes than we understand our associates about us. We cannot expect to understand and appreciate Shakespeare; we cannot grasp the sublimity of Milton, if we do not first cultivate a love for poetry by reading short, simple poems. The treasures of Shakespeare are forever locked to us if we do not first climb to him step by step. Poetry naturally appeals more to girls than to boys—there is something in their nature which responds to the sentiment and musical rythm of a beautiful poem; but, even tho it does go hard at first for the boys, it is worth while. It is worth all their efforts of perseverance; it is worth all their efforts of dogged persistence. At whatever cost cultivate a taste for poetry during the adolescent period. Poetry has a refining influence which prose does not have. Show me a boy or girl who is fond of poetry, and I will show you a boy or girl who has fine sensibilities and high ideals.

A good wholesome writer is Louisa Alcott. Her "Little Men and Little Women," her "Old Fashioned Girl," her "Eight Cousins" and "Jo's Boys," are books for both girls and boys. We do not mean that no other books should be read except those which bear the classic stamp. Some very good books are "The Crisis" by Churchill, "The Man without a Country" by Edward Everett Hale, "The Little Shepherd of

Kingdom Come," "When Knighthood was in Flower," "The Wide, Wide World," "The Man from Glengarry," "A Singular Life," "John Halifax Gentleman," "Lost, Yet Found," "The Night of the 20th Century," "The First Violin," "Always Happy," "The Lamplighter" and "The Call of the Twentieth Century."

I have named only a few of the good books which can be had, but in choosing books always select one by an author who has a good recommendation. Don't read a book by an unknown author unless recommended by one whom you know to be a competent judge. If you start a book or story and you feel it is not making you better, throw it aside without finishing.

There is another kind of books which we should read, and that is books telling us about our own organization and which will help us to lead good, pure lives. Horace Mann has said of himself, "I was taught all about the motions of the planets as carefully as if they would have been in danger of getting off the track if I had not known how to contract their orbits; but about my own organization I was left in profound ignorance." If this mistake has been made in our education we have access to books and literature which will enlighten us in many respects, and if we do not avail ourselves of these opportunities we can only blame ourselves if we make grave mistakes in our lives. Girls should read Mrs. Mary Wood Allen's books for girls, and Margaret Sangster's books; boys should read Sylvanus Stall's books for young men. A magazine is now published by the name of "*Purity Advocate*" which should be found in every home in the United States. (The INGLENOOK expects to cover much of the ground covered by the *Purity Advocate*. Editor.)

Roosevelt has said, "There are great problems ahead of us as a nation, but the really greatest problem is the problem of making better men and women of all of us." I would add that this question would be more than half answered if we all used the greatest care in the selection of our books, and then read, read, read.

Elizabethtown, Pa.

#### A LOST SON.

WE want to learn the whereabouts of John W. Buzzard. He volunteered in the U. S. Army at Ft. Dodge, Iowa, in 1899, entering Co. A., of U. S. Infantry. He served three years in the Philippines, came back to San Francisco and reenlisted for three years more in Co. I., U. S. Infantry. Served for two years at Newport, Ft. Thomas, Ky., and was discharged at Ft. Sheridan, Ill., in April 1905. We have not heard from him since that time. He is our son, is thirty-one years old and we are anxious to know what became of him. Any information concerning him will be appreciated.—*Eliza E. Buzzard, Knoxville, Iowa.*

# A Christmas Sleigh Ride

Elizabeth Royer

IN the little village of Morris was Miss Amanda Parmalie's Finishing School for Girls, and the Morris Academy for boys. Now the rules of Miss Parmalie's school were very strict. After ten o'clock at night when the lights were turned out by Miss Parmalie herself, there could be no more talking, and all of her young charges were supposed to be quietly dreaming of how very well they would have their lessons on the following day. Every afternoon, for one hour, Miss Parmalie's sister, Miss Maria, led the girls for their daily walk in paths far from the Morris Academy. On no other occasion would any of them dare step outside the high board fence that enclosed the school yard, except on Saturday afternoon, when all who had had perfect behavior during the week were allowed to go shopping in the little village stores, or to call on some of their girl friends. As Miss Parmalie had a very high ideal of perfect behavior, the village stores were not greatly benefited by the additional population during the school year. However, the boys of the Morris Academy were not hampered by any such rules, for they boarded with various families in the town and were their own masters, much to their pride and emulation.

Christmas came on Tuesday, and the fifteen girls who were left alone on Friday to spend the holidays were either lamenting their misfortune or else planning how to get around the rules and have a little fun, as they sat in the schoolroom on Saturday evening awaiting the ringing of the study bell.

"Well, I don't see what we can do," complained Edith Brubaker.

"We can't do anything. That's all there is to it. Of course Miss Parmalie won't let us go anywhere, and who cares for an old turkey dinner if we can't have some fun too. Say, wouldn't it be fine if we could have a sleigh ride! The roads are just right." Kate Merrick who had been reading in a corner threw her book aside and came closer to the circle of girls around the fire.

"Maybe something nice will turn up," meekly suggested Estella Myers. She was only thirteen and not a favorite with the other girls.

"O yes, Stell, of course something nice will turn up in this school, especially if we sit down and hold our hands. Like as not Miss Parmalie will play tag with us and have a party and invite all the boys," said Mary Crawford.

"You don't need to be so cross about it, Mary.

Be still, girls, I hear someone coming," commanded Kate.

The door opened and in popped Ada Foster with

her hair all blown about, and her cheeks rosy from the wind.

"O girls, you—er—er, say Stell, won't you go up and hunt my "math" for me? There's a dear. Come, go at once. Altho anxious to stay and hear what was said Stell also wanted to keep on the good side of the older ones, so she went away on her errand.

"You can't guess what I know," cried Ada, and they all gathered around her exclaiming and coaxing her to tell at once. "Well, since Stell is out of the way I will tell you. She is not to be in it. I got a perfect mark last week and Parmalie let me go to see cousin Ruth. Harry Blain and Carl Raymond were there, too, all afternoon."

"You lucky girl," interrupted several.

"Don't talk until you hear what I have to say. We planned the best sleigh ride for Monday night that ever was."

"But we can't go," came from several.

"Yes we can. Now listen, or Stell will be back and let it out. On Monday night when the study bell rings at seven we will go to our rooms and pretend to study, but as soon as all is quiet, Kate, you and Edith that room down there next to the window that faces the back fence, must sneak out of your room and open the window and crawl out. Harry is going to take one of the pickets off the fence so we can get thru and a lot of the boys will be waiting with two bobs."

"Do you suppose we can do it?" shouted the girls.

"Sure we can. Just wait 'til I get thru telling you. Then May, you and Gerty come next and so on until we all get out. Now remember Stell is not to know."

"Well, we can't keep it from her. She is always tagging some of us."

"Yes we can. She has special permission to go and see that wonderful aunt of hers on Monday afternoon, and she won't get back until time for the bell. Then she will have to go to her room and change her things, and we must get out while she is doing it. If she catches us we will have to take her, or she will tell on us and spoil it all."

"It seems mean not to take her," said Edith.

"Now Ede, you know how she acts. Don't be so awful good. It won't hurt her to stay here," replied Ada.

"I know, but she is the youngest of us all, and we ought to be kind to her."

"We will take all the blame, won't we girls, so you needn't hurt your conscience over it, Ede."

"Suppose Miss Parmalie should see us. What

would we do?" asked Kate who stood in awe of Miss Parmalie.

"She won't because she and Miss Maria always talk over our shortcomings in the evening. Its lucky too, that the recitation rooms are between ours and hers. or she could hear us. If she should happen to come down the hall and meet one of us at the window, we must make some excuse and go back. Each of us must wait until the other is clear thru the fence before we get out. If we don't make any noise she can't possibly know what we are doing. Then we can come back by the time the ten o'clock bell rings and climb in again, and all be in our beds when Miss Maria comes around to see that all is well."

"Hush! here comes Stell." And they all started to talk of something else as Stell came in with the book for Ada.

Over Sunday there were many whispered conversations, plans were made and remade for the outcome of their excursion. At first some were afraid to undertake it, but on Monday evening when the time came all were ready to go and anxious for the fun. They were so interested in their own plans that they had not noticed an unusual quietness on Stell's part, and if they had, they would hardly have given it thought, except perhaps to be glad for the relief from her continual chatter. However, Stell had sharp eyes and knew how to make use of them. On the evening when Ada and the girls had planned the ride, she had listened at the door and had heard enough to decide that she was going along, whether they wanted her or not. She could crawl out of the window as well as any of them, and better than some, for she did not care for spoiling her clothes, and if she was once out with the rest, they would have to take her.

The seven o'clock bell rang on Monday evening and the girls went to their rooms as usual. Kate and Edith waited a little and then crawled out of the window, found the hole in the fence, and were received joyfully by the boys waiting with the bobs. One after another the girls came out, and congratulated themselves upon their escape from Stell as well as from Miss Parmalie. Mary was the last one to go, and just as she had dropped out of the window and pulled it shut after her Stell came from her room and opened it again to follow, when Miss Parmalie entered the other end of the hall and was beside her before she knew it.

"Estella Myers, may I ask what you are doing here cooling off the house and taking your death of cold?"

"Why—a—a Miss Parmalie, I—a—a just came here to look out a minute."

"Look out a minute! Go to your room at once and make better use of your time."

"Yes, Miss Parmalie."

"Hurry, close the window and don't let me come here again and find it open."

"Yes, Miss Parmalie." And Stell was compelled to return to her room while Miss Parmalie watched her until her door closed.

"I thought I heard someone outside the window. I wonder if that child could have been talking to some boy. She looked guilty," said Miss Parmalie to herself. She raised the window carefully and looked all around but could see nothing unusual, as the back yard was shaded by large evergreen trees making it impossible for her to see the tracks in the snow, for she was near sighted and rarely wore her spectacles because they made her look old. Satisfying herself that all was well and feeling gratified that all her young charges were studying so quietly on the very evening when she had expected the most trouble, she went back again to Miss Maria and spent the evening entertaining several callers who came in.

Stell was left alone. She had heard the sleigh bells jingle as the bobs drove away while Miss Parmalie was talking to her, and then she knew that there was no use thinking of going with the rest. What could she do? They had gone without her, and she had not even been able to follow them, and now she must do something to get even. It would be so much better for Miss Parmalie to catch them coming in thru the window than for her to tell. After thinking a while she finally decided upon a plan. She knew where the girls kept everything for she had been in their rooms so often, and therefore it was no trouble for her to find the keys to their doors which they had left open. A little while before it was time for them to come back, she locked all of their doors and took the keys to her room and locked herself in. Then she waited at the keyhole listening for them to come. All of the other rooms in the building had been locked by the ones who had gone home, so she knew that none could sleep in any of them, and anyway when Miss Maria would come to see that all was well, she would find out that they were not in their own rooms and report to Miss Parmalie who would investigate.

A few minutes before ten she heard the window raised and someone get in. Then several more came. They stood about waiting for the rest a little while and then several went to their doors and tried to get in. In a moment they found out their trouble and were back again at the window telling all the rest. She could hear their whispers and catch fragments of their conversation.

"I believe it was that mean little Stell. We might have known that she would find us out. There's not a thing but what she sticks her nose in it," said Ada wrathfully.

"We'll pay her back for this. She can't escape us," said another.

"Well anyway," said Kate, "She can't spoil all of our good time."

"I should say she can't," answered one.

Mary pulled out her watch and exclaimed, "Girls, it's almost ten. We have got to do something or Miss Maria will come and catch us."

"I have an idea," whispered Ada.

"Good for you, Ada. Tell us."

"I am going to go to Miss Parmalie's room and ask her for the master key. I will tell her that I am sick and want to get into the store room to get some quinine. Then we can open all the doors and I can take back the key." "Just the thing. Hurry up."

Ada threw off her wraps and started toward Miss Parmalie's room. She knocked timidly and asked for the key. Miss Parmalie was very amiable for she had enjoyed a pleasant evening visiting, and had not been troubled with the girls.

"Why Ada," she said, "That is too bad. What is the matter?"

"Oh, I don't feel good. My head aches," said Ada.

"You look like you had a bad fever. I certainly hope you aren't going to be sick. How red your cheeks are. I will go along with you to help find it."

"Oh, Miss Parmalie, you needn't trouble yourself. I am not very bad. Please leave me go alone. I do not want to trouble you."

"No, I shall go with you. You look ill, and if you should get sick, I never want to give occasion to any one to say that I neglected you."

Poor Ada could do nothing but walk meekly back thru the hall and meet the girls. Miss Parmalie started at the sight of them.

"Young ladies, what does this mean?" she asked.

No one answered.

"Will someone kindly tell me at once what the meaning of this is. Why are you not in your rooms? You all know that it is against the rules for you to be in the halls at this time of the evening. Why do you all have your wraps on?"

Still no one answered. What could they say?

Stell was listening at the door and laughing within herself. This was certainly better than she had expected. For Ada, the very one who had insisted on her not going, to be caught in this way was too good. She had never had much self-control and now she gave way to laughing so that it became audible in the hall, and Miss Parmalie came to the door and demanded that it be opened.

"Estella, open this door at once and explain this behavior to me. Are you up to some mischief?"

Stell came meekly out.

"No ma'am, I haven't done anything. Ask the girls."

Finally after much commanding the whole story came out. Miss Parmalie was shocked beyond description. To think that all the teaching she had given had resulted no better than this. What could she say to their parents when they asked why their daughters

had been allowed to go sleighing unchaperoned? She had no words in which to express herself. The girls stood guilty before her. At last Edith came forward and said, "Miss Parmalie, we haven't any excuse to make. We wanted to have our fun. We have had it. Now tell us our punishment and leave us go."

At last Miss Parmalie could speak. She poured out her wrath upon them as they had never heard her before and ended up by saying, "You appreciate nothing whatever that is done for you. For punishment you will not be allowed to go out on any Saturday night during this term. On New Year's Eve Miss Maria and I had planned a little party for you. We were going to break over our rules once and allow you to invite your friends, either boys or girls, and try to give you a good time, but now we will not do it. We certainly cannot have confidence in any of you. Estella, you are as guilty as the rest. I understand now why you were at the window. Get the keys for the girls and all of you go to bed at once." She walked away and left them looking shamefacedly at each other.

"Oh," said Ada regretfully, "If we only could have waited until New Year's! Think what a lovely party we could have had."

"Come on" said Kate, "Let's go to bed and think what a lovely time we have had."

## HOW THE SNOW COMES DOWN.

JENNIE TAYLOR.

The snowflakes come playfully fluttering down,  
They softly, silently fall.  
They cover the fields, the houses, the trees,  
Transforming them each and all  
Into fairylands, wonderful, spotless and new,  
Where each house is a palace fair;  
The garden, the highway, the ice-roofed stream  
Are so white and so still everywhere.

The snowflakes come rapidly fluttering down,  
They vie with the northern blast  
That tosses, and blows them, and whirls them about  
As they come still more thickly and fast;  
That gathers them up into high fleecy drifts,  
Or scatters them far and near,  
Till the fluffy-winged flakes, all aweary with play,  
Nestle close to the earth brown and sere.

The snowflakes come furiously fluttering down,  
Till the blinding storm is done.  
Then over the hills, the houses, the fields  
They glean in the shining sun,  
And all thru the long, cold, winter time,  
While the icy northwinds blow,  
They tenderly wrap the earth in sleep.  
Such beautiful, wonderful snow!

\*\*\*

## Caring for Lawns.

It is never well to use manure on lawns, for it introduces a world of weeds and often tough grasses which choke out the lawn grass entirely and drain the soil of its nourishment.

Bone-meal applied at the rate of about 65 to 70 pounds for each 5,000 square feet of land—otherwise every 50 by 100 foot plot—is probably the best fertilizer generally for the lawn or garden. It is sold by the ton or at retail in sacks of different sizes, 100 pounds costing \$2.

## DIVERSITY OF GIFTS.

BERTHA DELP.

CLOSE by there is a family in which there are four sisters. Three of these sisters have some work, which besides being of a pecuniary value, is also an accomplishment. One is handy with the needle and is a dressmaker; one is a school-teacher; and the third loves music and books; but the Giver of gifts seems to have forgotten the fourth, for her fingers seem too stiff and awkward for the piano. She cannot remember dates in history nor solve arithmetic problems. Sewing does not come natural to her and in society she seems backward and silent.

Shall we say she is unfortunate? That she is, the unlucky one of the family? Ah! wait and decide after you have learned a little more about her.

Do you see those flowers in the window and those out in the yard? Who takes care of them? Why, Mary does. She spends so much time with them, and we could not do without them. They make the room so cheerful.

What a nice flock of chickens you have! Yes, Mary takes care of them. She seems to have better success than any one else.

Who does your washing and ironing? You seem to get so much work done, and yet your girls are busy with their school work and sewing? Why, Mary does it. We could not get along without Mary.

Mary, the girl who has no special gift, is the one we could not do without, for it is she who does the little things which nobody else wants to do or has time for. It is she to whom father and brother come for the extra jobs. Mother can always depend on her and the sisters call upon her when they are in a hurry.

Always cheerful and ready, home would not be home without Mary. For, not meaning to be unkind, the others leave the unpleasant tasks for her. If Mary would take a visit of several weeks perhaps the others would learn to appreciate her more. We could not dispense with the Marys, what we need to do is to be more kind and thoughtful to them.

If any who read this happen to be the Mary of the family let me say to you, "Your gift is of far more value than that of your more brilliant sisters. We need you in our homes to make them brighter and better. God has given you your gift. You may never become famous in that which the world calls famous. You may not even be known outside of the community in which you live, but God sees and remembers your labors."

It is the home-girl who makes the true home and the true mother. From these homes come the true men and women, who rise up and call her blessed.

The home-girl has a great opportunity in helping to make her brothers what they are. She can make the home such that they will not want to leave it for

the streets or places of harmful amusements. She can teach them truth and purity by her own life so that they will choose friends and companions of the noblest and best.

So keep on making our home cheerful and good, and do not look upon your work as drudgery, altho some of your friends may. Make it a noble calling by noble thinking.

The lowest work may be exalted by a noble mind and again the highest and noblest calling can be debased by an ignoble mind.

There is a tendency for girls of today, to leave the home for the office, etc. Let me urge you not to do it, but educate and prepare yourself for a home-girl.

*New Murdock, Kansas.*

## MEDICAL ITEMS WORTH REMEMBERING.

Carbolic Acid.

DR. B.

CARBOLIC acid is a common but dangerous article and very few homes are without some quantity of the drug. Many accidents result from its careless usage, and many children are either injured or poisoned from it in an accidental way.

While the drug possesses some good medical qualities yet its destructive power to tissue is such that no bottle containing it should be allowed in a home without a poison label on the bottle.

As an antiseptic dressing to sores or cuts, twenty drops of the drug to one quart of cold, boiled water is of proper strength for either man or beast.

If any part of the body is burned by the acid a thick paste of common baking soda should be applied, or even a paste of common lime applied for a few minutes, and when removed apply cider vinegar. Many people apply the pure acid to kill corns and in every case of such practice evil results follow.

In such a case keep a soda paste constantly applied until the action of the acid is destroyed. The juice of lemon will also act well for such cases.

If the drug has been swallowed, weak cider vinegar or lemon juice may be swallowed, or even strong soap water may be drank. Epsom salts in solution is also a good agent to kill its destructive action. One thing to be remembered is that no glycerine or oil is to be given.

Another article that is in every home is one of the many washing teas or lye. If a child receives a burn or has swallowed the article apply either lemon juice or cider vinegar to the burn, and give weakened cider vinegar to drink if the lye has been swallowed. Soon follow this with sweet milk or cream, and then cause a vomit. To avoid accidents keep each bottle of medicine properly labeled and in a secure place out of the reach of children.

## FOR THE HOUSEWIFE.

ETHA EVANS BEISEL.

Do you save the cooking recipes you find in your different papers and magazines? There are many excellent ones obtained in this manner that do not find their way into cook books. But instead of saving the clippings in an odd jumble and in such a confusion that one isn't tempted to use them on account of the time that must be consumed to find the required one, try using the card system. It is so simple and so convenient.

Make your cards of uniform size and large enough to receive a medium-sized printed or written recipe. Paste each recipe on a separate card. Or, if a recipe is to be copied, write it on the card in a neat manner. Then have the good husband fix a box with several compartments in and label each compartment for that which it is to contain. There will be one for all the cake recipes, one for the pies, one for the puddings, etc. Then when one is compounding some delicacy it is so much nicer to have just a card lying on the table before one, than to have a cook book lying open with a tendency to close when one's hands are the busiest. And then one knows just where to look for one's favorite recipe and the trouble arising from having to sort over a miscellaneous collection of recipes is saved.

Discard the recipes of no value and save the tested ones. This idea as to arrangement did not originate with me, but it is such a good one, that I want to pass it on to the INGLENOOK readers.

*Buford, N. Dak.*

This is a capital idea. We want more household hints. Who will give the next one? Let's have one each week.—Ed.

## SPIRITUAL FLASHES.

(CONTRIBUTED.)

It is Within You.

If you do not wish for the kingdom of heaven, don't pray for it. But if you do, you must do more than pray for it; you must work for it. And to work for it you must know what it is; we have all prayed for it many a day without thinking. Observe it is a kingdom that is to come to us; we are not to go to it. Also, it is not to come outside of us; but in the hearts of us. "The kingdom of God is within you." And, being within us, it is not to be seen, but to be felt; and though it brings all substance of good with it, it does not consist in that: "The kingdom of God is not meat and drink, but righteousness, peace, and joy in the Holy Ghost;" joy, that is to say, in the holy, healthful, and helpful spirit.

**The Successful Minister.**

A GREAT many attempts have been made to answer the question: "What is the first quality of a successful minister of the Gospel?" Some would say

scholarship; some logical power; some oratory; but it seems to me that the first characteristic of the great preacher is, the *spirit of helpfulness*; one who loves to help men and women; one who goes about doing good, to whom an opportunity of doing good to a human being is a benediction more precious than gold and silver; one who has this quality cannot fail in his work even though there are many things which he lacks. All the other gifts and attainments without this one, cannot make him successful. With this, blessed by the Holy Spirit, he cannot fail to be useful. He who loves man for man's sake will be loved by men, and he will place his impress upon them not only for time, but for eternity.

## VINES—WHICH?

BY AUNT MARY.

"WHAT are some good vines and plants for shading windows and porches?" INGLENOOK, page 131.

Replying to this question would say that as far as my experience goes, I have never found a vine with more good qualities than "*Clematis Paniculata*." During its season of bloom, August and September, it is a sheet of white, fragrant and dainty and lovely in every way. If planted with a northern exposure it will retain its glossy foliage far into the winter. I have three vines, four years old, from seed, which were a beautiful sight last season, but would advise getting the rooted plants, which are advertised in all leading seed catalogs. The tender *Hydrangea* is a lovely plant to place at the foot of this vine, or, in fact, it is a desirable plant anywhere, if it can have shade during the heat of the day.

## THE OLD WOOD.

RICHARD BRAUNSTEIN

To me, no dull insensate growth,  
Those heirs of time appear;  
But life with thot and feeling both,  
My fancy findeth here.

A purpose held, an upward aim,  
Those sylvan monarchs teach;  
The finer traits that man may claim  
Seems attributes of each.

How deep the strong oaks grasp the soil,  
At danger, loud they scoff;  
The tempest in its strength they foil  
And hurl its dark clouds off.

Theirs is the nature that achieves,  
No yielding there is found;  
The very rustle of their leaves  
Assumes a martial sound.

Of gentler mold of softer wood,  
One prone to praise or dream;  
A stately poet of the wood,  
The lofty pine doth seem.

And softly thru its tender leaves  
The wind is mourning on,

As when some noble spirit grieves  
For some great hope now gone.

Scarce matched in beauty of them all,  
On high the elms extend,  
Graceful as fountain in its fall,  
Their long, lithe branches bend.

The autumn touch of beauty brings  
New charm upon the trees;  
The glory of a thousand kings  
May not compare with these.

The maple, dyed in sunset hues,  
Would dim the Hebrew's throne;  
And Sheba's Queen would scarce refuse  
To say she was outshone.

A saffron tint the beech receives,  
The birch's boughs turn pale;  
O'er ledge and crag the berry leaves  
In dark red streamers trail.

In sunset robes the ivy lies,  
Upon its mound of stones;  
A scarlet sash the woodbine ties  
Around the cedar's cone.

And over all the autumn air,  
Lies like a golden flood;  
The work of God seen perfect there  
Within the grand old wood.

#### THE GOOD WE CAN ALL DO BY PASSING IT ALONG.

"THERE go the Andersons in their new automobile," said Augusta, as they sat on the vine-shaded piazza.

"I'm crazy for a ride in a real auto, and I've never even set foot in one. People *are* selfish, and I don't suppose Maude Anderson will ever think of inviting me."

"Well," said her Friend Mattie, "I don't suppose they realize what a great treat it would be to you or me." She hesitated a moment, then continued boldly "just as *you* don't realize what an immense pleasure it would be to mamma if you would invite her some time when you are going for a long drive. Of course, *I've* been with you lots of times, Gustie, but I've often wanted to ask you to let mamma have my place some time. She never has anything but trolley rides you know."

"Why, I never thought of it," said Augusta, promptly. "Why didn't you ask me before? We've always had a horse and have been so used to driving that I never thought it would be any special pleasure. Tell your mamma I'll call for her Saturday, and we will take the prettiest ride I can find—where trolley-cars won't take one."

When Mattie told her mother of the invitation that evening, Mrs. Loring's face lighted up. "Indeed, I should like it very much, but wouldn't Augusta enjoy it more if you went instead?"

"No, mamma; she really wants *you* this time. I'm not invited at all," laughed Mattie. She had not told her mother of the conversation that led to the invitation,

and that the first suggestion of the drive had come from Mattie herself.

"It has been a long day," said Mrs. Loring, "since I've had anything more than a car ride."

"Dade, thin," said Mrs. Murphy, who had just brought back the laundry, and had stopped a few minutes, at Mrs. Loring's invitation to rest and enjoy the cool glass of lemonade that was very refreshing after her long walk, "it's meself would be glad to get a car ride now and thin—'way out to the parks, wid me little Maggie—but it's precious few nickels I can be sparin' fer car rides this summer."

Mrs. Loring and Mattie gave a quick glance at each other as the same thought flashed through their minds. Had they not neglected a very simple means of giving pleasure to others? They could well afford the money to give Mrs. Murphy and her ten-year-old Maggie a refreshing car ride at times.

"Mrs. Murphy, when I have my pleasant carriage drive next Saturday, I'd like to think that you and Maggie are having an outing too. You can take these dimes and enjoy a good ride. It will give me real pleasure."

"Wasn't Mrs. Loring good to give us this lovely ride?" said Maggie to her mother, as, in the very front seat of an electric car, they rode out to one of the beautiful parks the next Saturday afternoon.

"Yis, indade," said Mrs. Murphy. "And 'tis meself was wishin' we cud 'a' brought Biddy Ryan's little lame Timmie along wid us. How he would 'a' liked to see the green grass and the yaller buttercups!"

Maggie puzzled over this for some time. She knew it cost money for car rides, and she knew her mother had none to spare. It was hard work sometimes to get enough to pay the landlord and to buy food.

Before the ride was over, she had solved the problem. "Mama, I think Mrs. McCarthy would lind me her baby-carriage, and I could wheel Timmie over to the square, where he could see the fountain and the grass and the trees, and it would be nice and cool. He wouldn't be very heavy, if he *is* 'most five. Can I?"

"Yis, dear; an' it's a good thought, darlin';" responded Mrs. Murphy.

So the deed of kindness was "passed along." And each one found it was in her power to give pleasure to others—to share what seemed a simple thing to her, but meant much to others less fortunate than herself. —*Exchange*.

#### CHINESE AND AMERICANS.

We bake bread; the Chinese people steam it.

In rowing a boat we pull; they push.

We keep to the right; they keep to the left.

We use a soft pillow; they use a hard one.

Our sign of mourning is black; theirs is white.

We shake a friend's hand; they shake their own.

We locate intellect in the brain; they locate it in the stomach.

## CREAM OF MAGAZINES

### A GREAT CITY ENFORCES PROHIBITION.

When I asked Senator Curtis of Kansas the other day whether the enforcement of the Prohibition law in that state had been injurious to business and whether it had retarded the development of the state, as has been so frequently represented, he referred me to C. W. Trickett, the assistant state attorney, who had been in charge of the prosecution of the liquor sellers in the thriving town of Kansas City, Kans., which lies immediately across the river from the Missouri city of that name and is the second largest live stock and meat packing center west of Chicago.

It has also extensive grain and flour trade, eighteen elevators, large smelting and refining works, the Missouri Pacific, Union Pacific and Rock Island railway shops and several other important industries.

The population, about 100,000, is composed very largely of foreigners, who are accustomed to the liberal habits of the European countries in drinking wine and beer, and the slum element is said to have been larger before the recent cleansing took place than in any other place of the same number of inhabitants in the nation.

At the same time there has always been a very large and determined element in favor of law and order and the enforcement of the Prohibition law.

For many years the city government was elected by the liquor element, which controlled the voting population, and were able to poll 2,000 majority for a mayor whose campaign platform was: "The saloons shall run."

Mr. Trickett, having been appointed assistant state attorney, was instructed by Governor Hoch to close up the saloons and enforce the Prohibition law in Kansas City, and he did it. When I asked him to tell me how it was done Mr. Trickett said:

"On June 8, 1906, there were 256 saloons in Wyandotte County, Kan., of which Kansas City is the seat. There were 200 gambling houses and more than sixty houses of evil repute.

"On July 3 following there was not a saloon nor a gambling house nor a disorderly house in the county, and there has been none since.

"Today Kansas City, Kan., is the largest city in the world without a saloon, a gambling den or a bawdy house. By reason of that fact and of the publicity given to it I have received inquiries from Germany, France, England and Canada as to the effects upon the morals of the people, upon poverty and crime and upon business and commerce.

### Believe Saloon Is a Necessity.

"There are thousands of good people all over the country who believe that the sale of liquor and dens of vice are necessary to the prosperity of a city or state.

"I recall that when the fight started in our county delegation after delegation of business men protested and said if we closed the saloons it would stop our growth, destroy the business of the merchants, deplete the deposits of the banks, stop the erection of buildings, render houses vacant, increase taxation, reduce the price of real estate, cause people to go over to Kansas City, Mo., to do their shopping and spend their money and ruin our town generally.

"One day a delegation composed of two bankers and three merchants, who had been appointed by the business interests of the city, came to my office and spent an entire morning presenting these arguments and begging me not to enforce the law.

"I told them that I was not responsible for the acts of the legislature, that I did not put the Prohibition law on the statute books of Kansas, but I had taken an oath of office to enforce it and intended to do so even if it made a desert of Wyandotte County and turned our flourishing city back into field and forest.

### How They Enforced the Law.

"I did not know what the result would be," continued Mr. Trickett. "I did not know whether the city would be injured, but I had a duty to perform, and I performed it to the best of my ability." \* \* \*

### The Effect of Prohibition on Business.

"What has been the effect on business?" I asked.

"Have you heard of Kansas City, Kan., being wiped off the map?" replied Mr. Trickett. "Have you heard that Wyandotte County has become a desert? Have you heard of any of our banks failing or any of our merchants closing their stores? Have you heard of anybody going bankrupt?"

"On the contrary, the committee of two bankers and three merchants who, as I told you, came to protest against the enforcement of the law about two years ago will now tell you or anybody that they were mistaken and that the abolition of liquor selling has been of decided benefit instead of injury to the business interests of the city. They will tell you that the deposits of our banks have increased more than \$2,000,000 since the saloons were closed and that the merchants have had to employ additional clerks to attend to their business.

#### **Banks Show Big Growth.**

"I can show you a letter from the president of the largest bank in our city, who was a member of the committee that came to protest, in which he says that within one year after the whisky joints and gambling dens were closed his deposits increased \$1,700,000. He says in his letter: 'We think we have the accounts of more than 50 per cent of the business men of this city and have talked with a large number of them about the effects of the closing of the saloons on their business. With a few exceptions they have stated that they are pleased with the results. I believe this feeling is shared by a large majority of the professional men and other intelligent citizens.'

"The president of one of our savings banks has written me that not only has its business increased 50 per cent, but that 75 per cent of the new customers are of the class that formerly spent all their money for liquor.

#### **Converted from High License.**

"One of our business men who was asked his opinion wrote to a friend, saying: 'I have been in business in Kansas City, Kan., for seventeen years, and there are more houses, and good houses, being built; more people are buying homes, and good homes, and seeking investments, than in any year since I have lived here. Like most of the business men of the city, in the past I have believed in high license and local option. Now I am in favor of closing the saloons and keeping them closed. Drinking is not a necessity; it is only a habit.'

#### **Building Gain Extraordinary.**

"The people who objected to the enforcement of the Prohibition law," continued Mr. Trickett, "said that it would destroy the prosperity of our city; they said it would stop the erection of buildings. But the official records show that during the year after the closing of the saloons, from July 1, 1906, to July 1, 1907, Kansas City showed an increase of 209.7 per cent in building operations, the largest of any city in the Union. The next largest gain was 77 per cent. Three times as many laboring men bought homes in our town last year as ever before in its history.

#### **No Use for the Jail.**

"The effect upon crime and disorder has been similar. The closing of the saloons has reduced our court expenses \$25,000 a year, which was formerly spent in the prosecution of criminals.

"During the time the saloons were open there was never a term of court that did not require from six to eight weeks to try criminals. Since then no term has been more than three weeks, and one term we did not

have a single criminal for trial. This month the same court opened its session, and it took only three days to try all the criminal cases on the docket.

Before the saloons were closed the city fathers were wondering where to get money to build an extension to the jail. Today its doors hang idly on their hinges. We have no use for the jail we have.

"I have a letter from the mayor of a city where there were only two arrests last year, and those were two men who got drunk at Independence, Mo., and took the wrong road to get home. I have a letter from the police judge of our own city, showing that day after day goes by without a single arrest in a city of over 100,000 people.

"Fifty thousand people gathered in the heart of the city during carnival week last fall, and there were only four arrests. The men in charge stated that it would have been impossible to have had it had the saloons been open.

#### **Charitable Needs far Less.**

"I have here a letter from the commissioner of the poor farm stating that there has been a wonderful reduction in the sending of old people 'over the hill to the poorhouse.' Their sons and daughters are taking care of them instead of making them subjects of charity.

"I have a letter from the director of the Orphan's home stating that during the time the saloons were open the average number of children they had to care for was fifty-six. Today they have twenty to care for, less than half the number they had when the saloons were open.

#### **Revolution in School Attendance.**

"Every saloon was closed on July 3, 1906. Less than three months after that our schools opened. In former years we had to employ from six to eight additional teachers by reason of the increase in population, but there was such an unusual demand for admission that we had to employ eighteen new teachers.

"I went to the teachers and said, 'From whence comes this large demand for admission to our public schools?' The result was a list of 600 boys and girls from twelve to eighteen years of age who attended the public schools last year for the first time and they gave as a reason why they had not attended in former years that they had to assist a drinking father to earn a living for the family.

#### **Prosperity Always Follows Enforcement.**

"Nor are these improvements and conditions peculiar to Kansas City," said Mr. Trickett in conclusion. "They have been duplicated in every city of our state in which the Prohibition law has been enforced, in Topeka, Wichita, Junction City, Fort Scott, Coffeyville, Independence and other places.

"You may go all over the state and the people will tell you that every single city, without an exception, where the Prohibition law has been enforced has enjoyed a boom, a prosperity such as it never knew before. I believe that the prosperity of Kansas is due quite as much to the Prohibition law as to the good crops.

"There are three places in Kansas today where a man can get a drink, where the law is openly defied—Leavenworth, Atchison and Pittsburg—and in every one of them the population has decreased. On the other hand, the population of Kansas City, Kan., has increased more rapidly than that of any other city in the state. Next come Wichita, Topeka and Parsons, all Prohibition towns.

"I think I have answered your question," said Mr. Trickett.

—William E. Curtis, in Chicago Record-Herald.

# Echoes from Everywhere

## \$1,000 Reward.

The American Humane Society of Boston, Mass., has offered \$1,000 for the best essay against international wars. Here is a chance for some of our Inglenook contributors. The same society is offering an equal amount for the best essay on vivisection—the common practice of experiment with medicine and surgery upon live animals in the interest of human suffering.

## About the Japanese.

At a meeting in Seattle, the Asiatic Exclusion League addressed a memorial to Congress, demanding immediate legislation for the absolute exclusion of Japanese, Koreans and Chinese, and predicting that the people would "take the law into their own hands" if Congress should not act without delay.

An organization called the Yellow Peril Exclusion League was formed at a meeting of labor leaders in Denver, its avowed purpose being to drive Japanese and Chinese from Colorado. Several of the speakers, one of them a Denver alderman, urged that the demand upon Congress for new exclusion laws should be emphasized by riots.

Seventy Hindu laborers recently discharged by the Southern Pacific Railroad Company were driven from a village near Marysville, Cal., last week, by the white residents. They have made complaint to the British Consul at San Francisco.

The British Columbia Legislature passed, on the 6th, an immigration bill excluding all immigrants who cannot read and write English or some European language.

Baron Takahira, the new Japanese Ambassador at Washington, said in London, last week, that he was delighted to return to America: "I know of no truer friends of Japan than the Americans. Our excellent relations and knowledge of each other will insure an amicable outcome at an early date of the negotiations which are still in progress." He had "never dreamed of the possibility of war between Japan and the United States." Such a thing was "unthinkable."

## Cats Transmit Diseases to Man.

The Medical Record recently gave some warning and information on this subject worthy our consideration. Below we give a part of what they say.

That diseases are not infrequently traceable to the lower animals, such as cats, dogs, the various species of the feathered tribe, or the so-called house pets and household pests (rodents), is unquestioned. Indeed, on account of the matter engendered by the so-called domestic animals with their attendant parasites (fleas, etc.), the German Government has promulgated rules whereby no domestic animals such as cats and dogs can be tolerated in a pharmacy, for every detail of the practice of pharmacy, especially in the larger cities, is closely supervised by the German Government. A man from a neighboring village bought a chicken from an infected farm; he took it home, and diphtheria broke out in the house

shortly after. This was the first case in that village. Dr. Turner further stated that his attention was called to these facts by the medical attendant, and the man himself corroborated the information in all particulars. Similar accounts are received from abroad as well as in this country as to the identity and transmissibility of disease from the lower animals, such as have been observed in swine, sheep, dogs, horses, and cattle, to human beings. I may here incidentally state that hair, fur, wool, and feathers are carriers of infectious material.

I am encouraged, therefore, to be content with drawing attention to the danger from infected domestic animals such as cats and dogs, whose rattling and mousing propensities and other habits render them especially liable to infection.

## Reducing Silver to Gold.

Scientists are still trying to make gold out of other elements. The claim is now made that silver has been so far transformed that it can hardly be distinguished from gold in looks. Alchemists and idlers of all ages have wished for this, but all in vain, but the time to ridicule scientific visions is past, and we hold our prophecy concerning the question, meanwhile earning our little stock of gold by the old way—the sweat of the face. This rule has not often proved futile.

It seems that the recent financial flurry caused the committee on House Bills to retrench a little in naval expense. Instead of four monster battleships the committee recommends only two to be built and a corresponding less number of smaller craft.

It is estimated that \$20,000,000 is spent in presidential elections, mainly for literature, speeches, travel and a little for boodle.

## Saloon Revenue and its Fruits.

Judge J. L. Fort, prominently mentioned for the next gubernatorial nomination on the Democratic ticket of Missouri, says in an interview:

"In Stoddard County, where we had \$15,000 a year from the saloons, our criminal courts cost us from \$20,000 to \$22,000 a year. Now, under Prohibition, the cost is about \$1,700 per year."

Speaking from the bench January 15, Judge Alton G. Dayton of the Federal Court at Parkersburg, declared:

"I have said it and I again proclaim it, that no man can be engaged in the sale of liquor and be honest. He will take the last dollar of a drunken man, kick him out and send him on to a drunkard's grave. They study dishonesty and come into court and perjure themselves to avoid punishment. We don't license any man to rob, steal or murder, but you can take the licensed saloons generally of the country and the murders committed under the sale of liquor will average one murder for every saloon in the country."

**125 Miles an Hour.**

The fastest time ever made by train has been attained on the Marienfelde-Dahlwitz Electric Railway, near Berlin. An electric motor car, over one hundred feet in length and weighing ninety-five tons, traveled at the rate of 125 miles an hour over a twenty-three mile track. The only discomfort experienced by the passengers was the terrific noise, which resembled the clanging of ten thousand blacksmiths' hammers. In America last April a Government relief train ran 168 miles in 161 minutes; and last May Mr. Harriman, the financier, crossed the continent from the Pacific to the Atlantic, a distance of 3,306 miles, within three days and thirty-three minutes, attaining a speed of eighty-three miles an hour over one track of 137 miles, and an average speed of sixty-six miles an hour—which is a world's record. The largest railway engine in the world is owned by the Great Northern Railroad of America. It employs two sets of drivers, and its total weight with tender is over 150 tons. It carries twenty tons of coal and 10,000 gallons of water. The most powerful engine is an electric locomotive designed for the New York Central Railway. It can carry a train weighing 900 tons at a speed of over sixty miles an hour. Its driving power is 2,800 horsepower, or fifty per cent greater than that of the largest steam passenger locomotive now in use. The highest railway ascends the Sierras, Peru. It tunnels the Andes at a height of 15,645 feet—an elevation reached in the short distance of seventy-eight miles. In its building 8,000 workmen were engaged at one time, and nearly 8,000 died or were killed during the six years of its construction.

The fourth Pan-American conference is to meet at Buenos Ayres on May 25, 1910. In that year the Argentine Republic celebrates the centennial of its independence.

The President in his message to Congress urged that America should be fitly represented at the international exposition to be held at Tokio, Japan, in 1912. Senator Cullom, following the suggestion, has introduced a bill to appropriate \$350,000 for a government exhibit there.

An ingenious method of securing many small contributions for benevolent work has been devised in Holland. Special postage stamps are issued at double price, one-half going to the postal authorities, the other to the Association for the Prevention of Tuberculosis. More than \$9,000 have already been realized by the society in this way.

A recent decree of the Pope orders the festival of the Virgin of Lourdes to be celebrated by the entire Roman Catholic world. Hitherto this devotion has been local, and permitted, not obligatory. The movement seems ill chosen for putting official recognition upon one of the most pitiful of contemporary superstitions.

**Compressed Air.**

Investigating the effect of compressed air on health, two British engineers have shown that a pressure of ninety-two pounds per square inch—more than six atmospheres—may be endured without unpleasant results. The pressure must be taken off at a uniform rate, however, at least twenty minutes being allowed for each fifteen pounds of reduction, and capillary circulation in the body must be kept up by muscular exercise during compression. Slight temporary neuralgic pain in the arms was the only ill effect of the great pressure.

**Temperance in Missouri.**

Columbia and Boone County recently excluded the saloons from their territory.

**King Leopold's Disease.**

The King of Belgium has been notoriously immoral and even cruel. It is claimed that his rule in the Congo Free State has been one of avarice and bloodshed. At his instigation unruly natives had their hands cut off and even feet and legs and ears, besides many other brutish acts. Travelers in that country claim there are thousands upon thousands of such victims.

At last gangrene has fastened upon the old monarch and his past wickedness will soon be ended. Added to his brutal rule is that of his polygamous life. Yet with all of this very little protest was made by the crowned heads of Europe. Monarchs seem to be a privileged class.

**What Are You Buying?**

The liquor traffic in proportion to its capital employs less labor than any other business. The New Voice is authority for the following statistics: In purchasing

\$100 worth of hardware one buys \$24.17 of labor.

\$100 worth of furniture one buys \$23.77 of labor.

\$100 worth of men's furnishing goods one buys \$18.34 of labor.

\$100 worth of clothing one buys \$17.42 of labor.

\$100 worth of cotton goods one buys \$16.91 of labor.

\$100 worth of worsted goods one buys \$13.55 of labor.

\$100 worth of woolen goods one buys \$12.86 of labor.

**\$100 WORTH OF LIQUOR ONE BUYS ONLY \$1.23 OF LABOR.**

**Railroad Accidents Reduced.**

The Union Pacific officials have published a report which shows that accidents on their road decreased sixty per cent last year, as a result of the \$12,000,000 expense in installing the block system and other appliances, and a traveling car in which instructions are given to every employé. Tests and drills in accuracy and efficiency did much to increase the faithful service of the operators.

Such news is welcome. Americans are the greatest travelers on earth, but the hazard imposed upon travelers in recent years was becoming so appalling that the public was holding on to the horns of the dilemma, not knowing what to do. The Union Pacific will soon win back their \$12,000,000, besides the good will of the public and a doubling of traffic as a result of their sensible move in railroad equipment.

**From the President's Message.**

"Just as the blackmailer and bribe-giver stand on the same evil eminence of infamy, so the man who makes an enormous fortune by corrupting legislatures and municipalities and fleecing his stockholders and the public, stands on the same moral level with the creature who fattens on the blood money of the gambling house and the saloon. Moreover, in the last analysis, both kinds of corruption are far more intimately connected than would at first sight appear; the wrongdoing is at bottom the same."

**Fortunes in Five-Cent Deals.**

Most people are watching for a chance to make money in great large lumps, and chunks. Ten thousand dollars cleared in one deal gives so much more satisfaction than the same amount made in five-cent deals. But while

people are holding their heads so high, multitudes of others are rolling up their millions in penny deals.

The penny slot-machines which register your weight, write your name, deliver gum, and so on, return fortunes to their owners every year. The five-cent car fare has made millionaires out of scores of people in the United States, and no more profitable business is known today than the streetcar business. Then there are the steam railroads which carry people on the basis of two cents per mile, and their earnings run up into the hundreds of millions.

Is it not time for the people to reconsider the value of the penny and lay more stress upon it? Small profits, honestly made, are to be commended to our youth. The desire for large profits often leads directly into speculation, then into gambling, thence to embezzlement which graduates into a full uniformed prisoner.

#### Restoring the Motto.

Plans are being formulated in Washington for a great national movement to force the restoration of the motto, "In God We Trust," on gold coins designed by the late Augustus St. Gaudens, under the direction and with the approval of the President. The Christian Endeavor Union of the District of Columbia has taken the initiative, and has instructed the superintendent to prepare resolutions citing the origin of the motto, the circumstances of its adoption, and the reasons why, as a Christian nation, the name of God should be referred to in the motto, and by legislation make its removal impossible hereafter. The resolutions will furthermore urge all Christian organizations, churches and societies, as well as individuals, to coöperate in effecting the restoration of the motto, and also in securing such laws as will insure its permanent retention.

#### Anarchist Shoots a Priest While Praying.

Denver, Colo., Feb. 24, 1908.—While Priest Heinrichs was bowing in blessing communicants at mass yesterday morning an anarchist stepped forward and shot the priest dead on the spot. While attempting to pass out of the doors of the church the assassin was caught by policemen and taken to jail. No cause is known for the rash deed further than the genuine hatred which anarchists have for the present organizations of society and state.

#### Oklahoma to Dissolve Pooled Railroads.

Guthrie, Okla., Feb. 26, 1908.—Gov. Haskell has given orders to State Attorney-General West to institute dissolution proceedings against the Rock Island and Frisco roads in the new state. It is claimed that the interests of the roads have been pooled by the managers, thus robbing the people of the benefits accruing from rival roads.

#### Suit Against Five Big Express Companies.

Judge Kohlsaat, of Chicago, is trying an important civil case which may be followed up later with wholesome legislation. The National, Adams, United States, Wells-Fargo and American Express companies are all defendants to a charge of rebating and other violations of the interstate commerce law. Some of the points are identical with Standard Oil tactics and similar heavy fines may be imposed. Since these companies charge as much as five times what some other carriers charge for carrying parcels per hundred miles it would seem that they could pay a few fines and still not suffer very much from it.

A parcels-post would remove all this wrangling.

#### Harriman Victorious.

Chicago, Ill., Feb. 26, 1908.—The famous injunction suit of Fish against Harriman is settled, Fish retiring from the fight. This leaves Harriman in control of the Union Pacific, Southern Pacific, Illinois Central, Oregon Short Line, with a large share in the Santa Fe, besides controlling interests in many connecting lines. He now dictates rates and terms to all the leading lines west of Chicago.

#### Government Buys Balloon.

Orders have been given for three army aeroplane airships to be furnished within six months. This places the United States first in equipment with army balloons. One of the contractors, Wright Bros., agrees to build a two-man aeroplane that can make a circle in the air at the rate of 40 miles per hour.

#### A 20,000-Mile Automobile Race.

On Lincoln's birthday six automobiles, one each of German, Italian and American, and three of French manufacture, started from Times Square in New York City for a trip westward around the world to Paris. The "Times" of New York and the "Le Martin" of Paris are the instigators of the race. Last year there was a race from Peking, China, to Paris which attracted much attention and helped to sell many daily papers in Europe. The papers mentioned above are again seeking notoriety.

From San Francisco to Alaska, and across Behring Strait, the machines will be transported, but all the remaining distance will be made by the machines. Gasoline for fuel has been deposited at intervals along the entire way except the first nine hundred miles after leaving Behring Strait.

#### University of Chicago to Teach Agriculture.

At a recent meeting of the authorities of the Chicago University it was agreed to give extension courses in agriculture as soon as plans could be put into operation. This shows the extensive growth which practical education has made within the last decade. It is only a question of time until the rural schools will teach the elements of agriculture and domestic science along with arithmetic and grammar.

## WANT AND EXCHANGE

To accommodate some of our readers and bring them in closer touch with each other, we have opened this "want and exchange" column.

Rates, twenty-five cents per insertion, not exceeding four lines, including name and address. Five cents per line for additional lines. However, no "want" may exceed six lines altogether.

**WANTED.**—At once. A reliable man with good recommendations. Married. Experienced in pipe-fitting, well pump work and work in hardware store. Work all the year round. Address Levi Zumbrun, Brookville, Ohio.

I HAVE several good farms for sale or exchange in Southern Missouri; climate mild, winters short, land productive, good schools, good churches, fine for fruit. For information address, F. E. Cochran, West Plains, Mo., R. R. 2.

**WANTED.**—Brethren to locate at Manzanola, Colo. Center of sugar beet and alfalfa territory. Fine climate. Brethren churchhouse in town. Several have already located.—S. Wenger.

**WANTED.**—Some brother with experience to take stock in and manage a bank in a good small town. Address, J. M. Stutsman, Elbing, Kans.

## MANCHESTER COLLEGE

Authorized by the Indiana State Board of Education to train teachers for the Public Schools.

SPRING TERM (12 weeks) opens March 2, 1908.

MID-SPRING TERM opening (for teachers and those preparing to teach) April 13.

SUMMER SCHOOL (12 weeks) opens May 26.

A Number of SPECIAL COURSES will be organized.

Write, stating what course you want.

For catalogue and particulars address,

**Pres. E. M. CROUCH,**  
North Manchester, - Indiana

## Matthew Henry Commentary on the Bible

Catalogue Price, \$15.00  
Our Special Price,

I. o. b. Elgin, Only

**\$7.95**

We have reduced the price of this commentary until it is within the reach of all. Every minister and Bible student who does not already have a set of these books ought to take advantage of this special offer. Better send your order at once.

**BRETHREN PUB. HOUSE,**  
Elgin, Illinois.

## RESULTS COUNT

That is why **ANGEMA** is becoming so popular.

Used as a Salve and as a Liniment.

**ANGEMA** keeps away croup.

**ANGEMA** prevents lung fever.

**ANGEMA** guards against **COLD** in the head or on the breast.

Have you tried it for your children?

Use **ANGEMA** and stop worrying. Your life will be prolonged, your children healthier and all happier.

It relieves **RHEUMATISM, NEURALGIA and HEADACHE.**

Be our representative in your community. **ANGEMA** is good. Our proposition to our agents is better. One lady sold 96 tubes in one small town in a month and without much effort at that. People want **ANGEMA** when they see it. Judge for yourself. Send 15 cents for a full-sized 25 cent tube.

Write for particulars **FREE.**

**THE ANGEMA LABORATORY**  
GARRETT, PA.

If you **SPRAY THIS SPRING**—and you'd better!—let me tell you about a compressed air sprayer, only \$7.50, which I have found by experience the best for orchard, garden, greenhouse work and whitewashing.

**W. G. NYCE, - St. Peters, Pa.**

JUST FROM THE PRESS.

## Revised Minutes

This new book just now coming from the press contains all the revised minutes of Annual Meetings up to 1898 and all the minutes since that date including the meeting at Los Angeles, California in 1907.

### HUNDREDS WAITING.

Hundreds of our ministers and others have been anxiously awaiting this announcement. A copy should be in the hands of each of our ministers and church workers in general.

### THE PRICE.

We make the price very low considering the size of the book, so all may be able to secure a copy.

The book is well bound in cloth and contains over 300 pages.

Price, per copy, prepaid, ..... \$1.00

Six copies to one address, ..... 5.00

Address,

**BRETHREN PUB. HOUSE,**  
Elgin, Illinois.

# SELF-PRONOUNCING FAMILY BIBLES

With King James (Authorized) Old Testament and parallel New Testament.  
Large Pica Type.

Our Price, per set of 7 volumes, f. o. b., Elgin,.... 3.50

Will send, express prepaid, for 75 cents extra.

## Mr. World and Miss Churchmember

By W. S. Harris.

It is a forcible allegory, somewhat after the style of Pilgrim's Progress, but in no sense an imitation of it. Fathers and mothers, it is the book that you should get for your son and daughter, and at the same time read it yourself. You will be stronger for the church after having read it. It illustrates vividly how Satan lures the church member, step by step, from the pure Gospel.

till finally he is lost forever. Send in your order at once and you will never regret it. Cloth only.

Our Price, Prepaid .....\$ .75

## Sands of Time

# ALBERTA

---

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the colonies already there and enjoy some of the material benefits as well as help build up one of the largest and best colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

# POOR DIGESTION

These words mean more than what many men and women realize.

Study mankind. He derives his strength from what he eats—if it is properly digested. If this is true then how can he gain strength if he does not have an appetite or what he eats does not digest?—Weak? Yes he is weak and grows weaker by degrees. You say he needs a tonic,—this is what he needs: **BRAWNTAWNS, THE VICTOR TONIC.**

Brawntawns builds up run-down systems,  
Restores appetites, strengthens and  
Aids the digestive organs by  
Working in harmony with Nature.  
Nervous, weak men and women who need a  
Tonic and will try it, especially  
All nursing Mothers and convalescents,  
Will find it a great blessing as a  
Nerve renewer, Health restorer and a  
System builder. 50 cents postpaid.

Mr. Wm. E. Gannon, the express driver of Frederick, Md., says: From personal experience I am made to say I firmly believe **Brawntawns, The Victor Tonic**, is the best Tonic and System Builder, in fact it has proven to be in my case.

I was so weak and run down that it was very difficult for me to ascend a pair of stairs, but after using **Brawntawns, The Victor Tonic**. I became much stronger and could go about my work with much more ease.

I wish further to say that I have been using the **Victor Remedies** in my home for 29 years during which time I have given all a fair trial and have never known any one of them to fail to do what is claimed for them. **Victor Remedies** compose my medicine chest.

**BRAWNTAWNS, THE VICTOR TONIC**, can be sent by mail upon receipt of price 50 cents.

## Victor Tea

*(The Old Fahrney Blood Purge)*

**The Blood Purifier,                      The Liver Renovater,  
The System Cleanser**

**VICTOR TEA** is a purely vegetable compound just as pure as if you were to go into your garden, along the bank of a stream or on the mountain heights to select your own herbs, roots, barks or berries, and the proportion of roots, herbs barks and berries contained in Victor Tea are unequalled for all Blood and Liver Diseases, Colds, Headaches, Constipation, Over-loaded Stomachs, Etc.

Do you have a tired, dull, sluggish feeling, cannot rest, work drags? All this is caused from an inactive, torpid liver, which is clogged by the impurities of the system and if not carried off will cause a more serious trouble.

**VICTOR TEA**, The Blood and Liver Purge, purifies the Blood, renovates the Liver and acts upon the bowels thereby thoroughly cleansing the entire system. **VICTOR TEA** can be sent by mail or purchased through the Dealers. Price 50 cents postpaid. Try a package now.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

# Late News From BUTTE VALLEY

---

The farmers in the vicinity of Macdoel are making good use of the beautiful weather we are enjoying, by clearing off the sage brush and plowing the ground preparatory to sowing spring crops. Quite a number of them have arranged to secure a car load of pure seeds from a reputable seed firm. This is a very commendable act upon the part of our farmers, from the fact that the virgin soil is very clean and should be kept that way by the use of pure seeds.

Mr. L. D. Howell and wife, of Washington, spent one week in Macdoel and purchased a farm west of town. They have returned to their former home at North Manchester, Indiana, to visit friends and relatives, and expect to come back in the fall and improve the farm.

Mr. Roy E. Swigart, of Dixon, Illinois, is expected here with his family the first of the month and will move on his place recently purchased. Mr. Swigart is a very influential man, and his coming here means a larger following later.

The Railroad Camp located in Macdoel has been moved to Dorris. The steel-laying gang is busy laying track from Bray to Macdoel. But a few days more and we will see the smoke of the locomotive and hear the sound of the whistle in our village.

The large excursion party leaving Chicago on the 3rd we expect here the 7th of March, and the indications are that a large proportion of them are coming to stay. Of course some will purchase land and return home for their families. The next excursion will be March 17.

Mr. and Mrs. L. H. High have their new house in Macdoel nearly completed.

Mr. J. G. Perry, a former merchant of Abilene, Kansas, has purchased several lots on Montezuma Avenue, and will immediately erect a building for a complete line of hardware, farming implements, etc. Mr. Perry is an energetic business man and will help to make things move.

Massic & Son say their business is increasing every day. The same may be said of every other business firm in the city.

Smith & Maust have their new building completed and are ready to stock up as soon as the railroad is completed, which will be but a few days. If you want to keep track of our town, it is necessary that you do not make your visits too far apart, for things do move here.

Many of the farmers are getting their sugar beet seed from the Department of Agriculture.

Joseph Clark and Miss Cades Smith were united in marriage last Saturday.

Miss Florence Hufford has been a success in conducting our school in Macdoel. She thinks that she will undoubtedly double the enrollment of scholars next term. There are nearly 100 children of school age in our district.

If you can't come on the excursion of March 17, arrange to come on the 31st.

# The Riddle of Life

A noted author has said that life "is a riddle and the key to the riddle is another riddle." This applies with equal force to life in all its phases, including our physical existence. It is indeed, a mystery. Much has been written in a scientific way as to what life consists of, but very little is known beyond the fact that the blood is the life. Even in ancient times, it was written "and the blood is the life thereof." Accepting this fact as our foundation, we find the blood to be the most important part of our physical being and it emphasizes the necessity of keeping our life stream pure and vigorous. To ignore this fact is but to invite physical pain and suffering.

A weak or impure condition of the blood shows itself in a thousand different ways. We meet people every day who appear pale and in a certain sense, bloodless. They have blood enough, but it is thin and vitiated, lacking in power and warmth; others again are florid, showing an abundance of vital fluid, but pimples and skin eruptions betoken its impure condition; others again by the peculiar color of the whites of the eyes and yellow skin, show that the blood is charged with bile owing to an inactive liver; while here and there we find a rheumatic, tortured by the presence of uric acid in the blood as a result of weak kidneys, and so on in many different ways.

All these conditions are bad. What is needed is a good reliable remedy that will cleanse the blood of its impurities, revitalize and enrich it and quicken its circulation. There are thousands of so-called blood medicines to be had. A few are good, some are bad and the rest indifferent. Any medicine that moves the bowels, however drastic its composition, is advertised nowadays as a blood purifier.

The purpose of this article is to call attention to a remedy which is without a peer as a blood-purifier and health-giver and which has the record of a century's constant use behind it. It is known as DR. PETER'S BLOOD VITALIZER and thousands upon thousands have testified to its remarkable power. It not only cleanses the vital fluid but makes rich, red blood and sound, solid, healthy flesh. When you commence to use it, you will not remain long in doubt as to its effect. The very first bottle will demonstrate its merits.

## Saved His Life.

Toledo, Wash., July 5, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—The medicine arrived all right about three days after I had written you. I have sold seven bottles already and am almost out of the Blood Vitalizer. I have only three bottles left. I am ordering two dozen bottles this time, as the demand is increasing. Not a word of complaint have I heard; only praise about your medicine. Your dealings with me have been honest and correct. I am your friend in truth. Your medicine saved my life, and I shall always be your friend. May God bless you for making such good, honest medicines.

Yours very truly,

James Turner.

## A Grateful Woman.

New York, N. Y., April 2, 1907.

Dr. Peter Fahrney & Sons, Chicago, Ill.

Dear Sirs:—Gratitude is what prompts me to write and tell you what your medicines have done for me. I was a sufferer from sick headaches and had consulted five different doctors and taken their medicines without success.

After using the Blood Vitalizer a short time I felt relief and in three months I was completely cured of my trouble, and in spite of my old age I have had no return of my former sickness.

In order to help suffering humanity I am at all times glad to give information about your medicine.

Respectfully yours,

Anna Nisly.

1560 Ave. "A."

---

DR. PETER'S BLOOD VITALIZER is known as a plain household remedy. It comes in a plain bottle in a plain wrapper, but it brings results and therein lies the secret of its success and everincreasing popularity. It is distinctly different from all other medicines. It may have its imitations but it has no substitute. DR. PETER'S BLOOD VITALIZER is not a drugstore medicine, but is sold to the people direct, through special agents appointed in every community. # **Possibilities of IDAHO**

---

## **Unlimited**

---

Many settlers are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for young and old of small means to get good comfortable homes with a splendid income.

### **Grain, Alfalfa, Sugar Beets and Fruits**

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

## **Come and See**

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

## **Realize \$1,000.00 Per Acre**

### **Some Facts Are Hard to Believe**

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

### **Figure It Up for Yourself**

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

## LEPROSY

### Its Social and Economic Aspects and Administration

[In response to our request for an account of the Molokai Leper Settlement known all over the world for its scientific and humane work, Mr. L. E. Pinkham, President Board of Health of Hawaii Territory, sent us the following.—Editor.]

THE experience of the Hawaiian race has varied little from that of other aboriginal races. Lacking knowledge of the diseases of civilization, or their control or remedies, this race has suffered accordingly, and become susceptible to certain infections to an infinitely greater degree than other races dwelling among them.

Between forty and fifty years ago the Hawaiians found numbers of their race affected by a disease the most tragic, socially, that ever afflicted mankind, leprosy, which was undoubtedly brought from the Orient, and was designated by the natives as the "Chinese Sickness."

On January 6, 1866, was established one of the most remarkable institutions in existence: the Leper Settlement on the Island of Molokai. The village is situated on a tongue of land, of some 6,348 acres, that juts into the sea, which surrounds three sides, and, on the remaining side, perpendicular cliffs, from two to four thousand feet in height, form a natural and practically impassable barrier to exit by land. Communication by sea is limited to one steamer call per week from which no person, the Superintendent excepted, is allowed to land, and on which officials only may depart, except by special permit of the Board of Health. The scenery is notable, impressive and rarely equalled.

The growth of this institution has been gradual in scope and administration. Its record has been one of

ever-increasing care and kindness, as well as the carrying out of its mission of protection to the general population of the Islands.

In whatever measure severity may, at times in the past, have been used in apprehending lepers, the process of law is now rarely used, for officials prefer to deal with the afflicted ones not as outcasts of society, but as deserving of the same consideration, care and sympathy accorded to persons suffering from other incurable and lingering diseases.

From Government Physicians, covering nearly every district of the Islands, and other sources, information

• One of the Homes Provided for Lepers, Molokai Settlement.

is lodged with the Board of Health that a certain person has, or is suspected of having, leprosy.

As soon as transportation can be secured the President of the Board of Health usually sends a written invitation, either direct or through the Government Physician, to the person suspected, to call at his office or report at the Receiving Station in Honolulu, stating all expenses will be paid, and if found free from

the disease the patient will be promptly returned home. If there is any doubt concerning a case the person is not sent to the Receiving Station until after a preliminary bacteriological examination. The result of this policy is mutual confidence, which is rarely

girls; the Baldwin Home, in charge of Catholic Brothers, domiciles 118 men and boys; and the Bay View Home, for the more helpless, cares for 38 persons; while 593 have homes of their own within the 488 buildings in the Settlement. There are resident 58 helpers (kokuas) and 18 persons, including clergymen, persons of religious orders, officials and physicians.

Six churches and a Young Men's Christian Association building afford religious privileges; several assembly halls, band stand, race track, baseball grounds and shooting ranges furnish means of amusement. Two small brass bands, glee clubs, pianos, organs and smaller instruments furnish music.

A number of the most modern conveniences are being, or about to be, established consisting of a steam poi (a native substitute for bread) factory, a first-class steam

A Home for Leper Women, Molokai Settlement.

abused. If abused, the process of law is put in motion.

It is now common for afflicted persons to carefully settle their affairs, avoiding contact with others during the few days necessary, and then, unattended officially, to proceed to the Receiving Station at Honolulu. The sensibilities are thus guarded and the state of mind and spirit is that of voluntary surrender of liberty and submission to care and treatment.

The bacilli of leprosy are found in the tissues of the body, and on the disclosures of the microscope, in the hands of the Bacteriologist of the Board of Health, depends the detention of a leper suspect. If the bacilli are not found the person is returned home with a certificate to that effect. If found, the person is held for examination by a board of four additional physicians. At this examination the suspect may be represented by a physician of his own selection and may demand further confirmatory bacteriological examination.

The full Board of Examiners render their decision, in each case declared leprosy, to the Board of Health, which confirms the declaration and formally orders transportation to the Leper Settlement on the Island of Molokai.

Within the Settlement the Bishop Home, in charge of five Franciscan Sisters, domiciles 79 women and

laundry, an ice plant, a power wood-yard, new and enlarged operating dispensary, hospital, enlarged water supply, etc., etc.

The extensive United States Leprosy Investigation Station is within the borders of the Settlement.

Two companies at the Settlement catch fish which are purchased by the Superintendent for consumption by the lepers, and their helpers only, alternating with

A Leper Orchestra, Molokai Settlement.

the meat supply. Other little business enterprises are carried on by the lepers. Agriculture, live stock raising and dairying, for local use, is carried on by the Board. Employment at fair wages is furnished all able and willing to work. None are forced to labor.

Everything necessary for the domiciling, sustenance, clothing, treatment, etc., of these wards is furnished free of cost to the recipients by the Territorial Government.

Excepting the officiating clergymen and one Brother, who for reasons of his own refuses to accept anything save subsistence, the Board of Health pays moderate salaries to all persons engaged in the work of the Homes.

Relatives are allowed, by special permit, to visit the Settlement for a stay of several days by entering a new and attractive Visitor's House, which is arranged for complete segregation and interview facilities, and where they may see and converse with their leper friends.

As the lepers have the franchise, are voters and take much interest in politics, political speakers, at election times, visit and address them from the segregated visitors' enclosure.

Leprosy has various physical manifestations, is usually slow in progress, and, in many cases, leaves the person vigorous and capable of the usual exertion incident to labor and sports.

The medical treatment of specific leprosy has been more or less intermittent from the fact facilities have been lacking for hospital detention and discipline, and from the fact the sufferers have not been inclined to submit to restraint or persevere in medication.

Dr. Rost of Rangoon, Burmah, was in 1903 quite sure he had discovered a cure, which attracted wide attention and was tried on a great number of cases, but early in 1906 he was obliged to admit failures.

Dr. Wilkinson of Manila, thought a six months' longer treatment with X-Rays would have cured certain lepers. We prefer to await further developments in the above experiment as we fear damage from X-Rays. We, however, have under consideration another treatment by rays less severe in their effect.

The Chaulmoogra Oil treatment practiced by Dr. Dyer in Louisiana we have used for a long time and are employing that treatment continuously. Specifics from Dr. Britton of Paris were unsuccessfully used. Experiments are being made with baths of a solution prepared from the eucalyptus. This treatment seems to be accomplishing much good and is received very willingly by the patients generally.

Other efforts are being quietly made by competent scientific practitioners to solve the problem. Should any reliable discovery be made it will promptly be made public to the medical world.

A variety of entertainments and luaus (feasts) occur from time to time. Races are run, field sports are enjoyed, shooting clubs test their skill at the butts and chess tournaments have disclosed, in a blind lawyer, one of the most remarkable chess players ever known.

On a visit to the Settlement in July, 1906, it was my privilege, with the Superintendent, to enjoy a special entertainment given in our honor, the like of which has probably never before been witnessed.

Twenty-four girls, inmates of the Bishop Homes for Girls, gathered in its assembly hall and presented a flag drill, with accompanying figure marching and singing. The pianist was a leper girl. The girls were all dressed in white, each carried an American flag.

A Hospital Room for Those Suspected of Leprosy.

and executed all figures with precision and without a mistake, while the singing was most creditable. Some faces were pretty, some showed their affliction, but all were attractive to the Superintendent and myself.

When the Settlement is represented as a place of confinement, abandoned hope, a chamber of horrors, the impression is very incorrect. A large correspondence with the outside world is carried on, all letters, however, being disinfected.

Persons not diseased may, from time to time, take short leaves of absence from the Settlement.

The Settlement contains ten square miles, an area larger than the ordinary city man avails himself of.

It has been the aim of the present President of the Board of Health to improve the appearance of the Settlement by erecting a higher class and more attractive style of buildings, that the villages may compare favorably, if not excel, those having a healthy population of like numbers. In the end economy, as well as increased comfort, will result, and the inmates be made more hopeful and ambitious.

Hope is not denied to those sent to Molokai, for where the evidence justifies re-examinations are held and, if found free from the bacilli, liberty is restored. And here comes the strange fact that for a number of years not one single person so freed has been willing to accept liberty and leave the Settlement. Yet this fact is not strange. Here is a village possessing public and private comforts and utilities vouchsafed to few villages of one thousand inhabitants; that has much that is pleasing and attractive in the village itself, as well as the influence of a fine climate and superb scenery. While the living is simple, the Territorial Government provides ample homes, food, clothing, attendance and medical care free of cost.

Leprosy rarely attacks white races, and lepers, usual-

this article is penned by one peculiarly qualified to describe and disclose the true facts as to the Leper Settlement on the Island of Molokai, and its people.

The Territory of Hawaii is entitled to the admiration of the civilized world, for it most willingly bears the burden of this one disease at a cost which would relatively cause the mainland of the United States, if similarly afflicted, to care for 532,513 persons at an annual expenditure of \$72,278,458.00.

He who seeks sunshine will find and transmit it, and he who chooses to dwell on the dark spots only will so darken his picture it will be untruthful.

In the *Pacific Advertiser* of Honolulu, Jack London says:

Leprosy is not so contagious as is imagined. I went for a week's visit to the Settlement, and I took my wife along—all of which would have not happened had we had any apprehension of contracting the disease. Nor did we wear long, gauntleted gloves and keep apart from the lepers. On the contrary we mingled freely with them, and before we left knew scores of them by sight and name. The precautions of simple cleanliness seem to be all that is necessary. On returning to their own houses, after having been among and handling lepers, the non-lepers such as the physicians and the superintendent merely wash their faces and hands with mildly antiseptic soap and change their coats.

A Bad Case.

ly early conscious of their trouble, withdraw from public notice and soon find their way to the Settlement on the rather remote and sparsely populated Island of Molokai, hence neither residents of the Territory nor travelers have any grounds for apprehension of a meeting or of contact with lepers.

The Leper Settlement on Molokai is known the world over and is usually described more on the lines of sentiment than fact. This article is written that the true general aspect and spirit of that community may be known. To them individually, as to all mankind, comes eventually suffering and death. Care and consolation is always at hand for them.

The writer excepts the former custom of one-day visits to the Settlement and chooses to remain days within its borders studying the needs and spirit of the people by personal meeting with individuals; hence

Not so was the leper and his greatly misunderstood and feared disease treated during the Middle Ages in Europe. At that time the leper was considered legally and politically dead. He was placed in a funeral procession, and led to the church, where the burial service was read over him by the officiating clergyman. Then a spadeful of earth was dropped upon his chest and he was dead—living dead. While this rigorous treatment was largely unnecessary, nevertheless one thing was learned by it. Leprosy was unknown in Europe until it was introduced by the returning Crusaders, whereupon it spread slowly, until it had seized upon large numbers of the people. Obviously, it was a disease that could be contracted by contact. It was a contagion and it was equally obvious that it could be eradicated by segregation. Terrible and monstrous as was the treatment of the leper

in those days, the great lesson of segregation was learned. By its means leprosy was stamped out.

The Settlement of Molokai enjoys a far more delightful climate than even Honolulu, being situated on the windward side of the island, in the path of the fresh northeast trades. The scenery is magnificent; on one side is the blue sea, the other the wonderful wall of the pali, receding here and there to beautiful mountain valleys. Everywhere are grassy pastures, over which roam the hundreds of horses which are owned by the lepers. Some of them have their own carts, rigs and traps. In the little harbor of Kalaupapa lie fishing boats and a steam launch, all of which are privately owned and operated by lepers. Their bounds upon the sea are of course determined, otherwise no restriction is put upon their seafaring. Their fish they sell to the Board of Health, and the money they receive is their own. While I was there, one night's catch was four thousand pounds.

And as these men fish, others farm. All trades are followed. One leper, a pure Hawaiian, is a boss painter. He employs eight men, and takes contracts for painting buildings from the Board of Health. He is a member of the Kalaupapa Rifle Club, where I met him, and I must confess that he was far better dressed than I. Another man, similarly situated, is the boss carpenter. Then, in addition to the Board of Health store, there are little privately owned stores, where those with shopkeepers' souls may exercise their peculiar instincts. The assistant superintendent, Mr. Waiamau, a finely educated and able man, is a pure Hawaiian and a leper. Mr. Bartlett, who is the present storekeeper, is an American who was in business in Honolulu before he was struck down by the disease. All that these men earn is that much in their own pockets. If they do not work they are taken care of anyway by the Territory, given food, shelter, clothes and medical attendance. The Board of Health carries on agriculture, stock raising and dairying for local use, and employment at fair wages is furnished to all who wish to work. They are not compelled to work, however, for they are wards of the Territory. For the young, and the very old, and the helpless, there are homes and hospitals.

In spite of the fact that they are afflicted by disease, the lepers form a happy colony, divided into two vil-

lages and numerous country and seaside homes, of nearly a thousand souls. They have six churches, a Young Men's Christian Association building, several assembly halls, a band stand, a race track, baseball grounds and shooting ranges, an athletic club, numerous glee clubs, and two brass bands.

Leprosy is terrible, there is no getting away from that; but from what little I know of the disease and its degree of contagiousness, I would by far prefer to spend the rest of my days in Molokai than in any tuberculosis sanitarium. In every city and county hospital for poor people in the United States, or in similar institutions in other countries, sights as terrible as those in Molokai can be witnessed, and the sum total of these sights is vastly more terrible. For that matter, if it were given me to choose between

Last Stages of the Disease.

being compelled to live in Molokai for the rest of my life, or in the East End of London, the East Side of New York, or the Stock Yards of Chicago, I would select Molokai without debate.

The action of leprosy is not steady. It lays hold of its victim, commits a ravage, and then lies dormant for an indeterminate period. It may not commit another ravage for five years, or ten years, or forty years, and the patient may enjoy uninterrupted good health. Rarely, however, do these first ravages cease of themselves. The skilled surgeon is required, and the skilled surgeon cannot be called in for the leper who is in hiding. For instance, the first ravage may take the form of a perforating ulcer in the sole of the foot. When the bone is reached, necrosis sets in. If the leper is in hiding, he cannot be operated upon, the necrosis will continue to eat its way up the bone of the leg, and in a brief and horrible time that leper

(Continued on page 224.)

## COMMENT: Critical and Otherwise

Richard Braunstein

A GOOD Christian humbr is one of the most desirable things under the sun. The writer pities a man with whom smiles are the exception,—whose face has a chronic winter of dubiousity always shadowing it, as if the world were more than three-fourths a barren waste and the remainder under a prohibition. The *life* of the universe is sunshine; the clouds that sometimes shut the sunbeams away from the world, are the vapors that arise from its own bosom; and how like the world are the souls living out their probation on it! Some souls are grand with a joyous life. They shine like the pellucid dewdrops of a summer morning, which millions upon millions of times reduplicate the sun, with the reflected beneficence of God. For them it is as natural for a song to bubble forth, as it is for a lark to rise out of the clover in the cool brightness of the morning, drawing a silver chain of melody towards the sky. They are not hidden in vapor; they have no property in chronic glooms, and the darkness that comes to them sometimes is that of the sorrowing kind, sorrow that is sympathetic, and impressed with the distresses and afflictions of the unfortunate, which, like a summer shower, gathered in the florid benevolence of the sun, scatters itself out in grateful blessing. Beneath their strong ministries the wilted waste blossoms again. Life becomes a genial tract, full of multiplying vitality.

Religion rejoices in the deep wealth of such a soul. In it is the moral material of all the practical utilities, the wide charity, the genial benevolence, the glorious humor that laughs hypocrisy and folly out of the world. In those souls, directly opposite in the quality of their human nature, who carry about them something that reminds one of the frigid drizzle of north-eastern storms, there is no religious nourishment or life of any profitable kind. As in the universe of natural life, the best fruits require a genial atmosphere here, so in the universe of soul, the best and most religious fruits require for their growth the spiritual sunshine of love, and, indicative of and inseparable from the inward love of Christianity is the outward Christian good humor.

In one of his Psalms, David said: "What is man that thou art mindful of him? And the son of man that thou visitest him?" Man is the greatest and noblest being in God's great universe, and as such is endowed with certain rights and privileges of which the lower classes of life are not participants. The greatest of these rights is that a man's future depends upon himself. Having chosen his occupation, he of

course, wishes to succeed in it. How can he best do so? *By concentrating his efforts upon a single thing.* Too many people spread their energies upon too wide a field, and not having force of character enough they become failures. Undoubtedly many men who fail would become successful if they would concentrate their efforts upon a single thing.

A great many men lament that circumstances prevent their success, while many others make a ladder of circumstances to reach the goal they are striving for. Later we find the one class plodding thru life barely earning a living and despondent about everything, while the other class, having mounted that high pinnacle, success, step by step, tower grandly above difficulties, glorying over them and rejoicing that they have triumphed over adverse circumstances.

A man who wants to do only easy things will never succeed. He is quite apt to underestimate the dignity of toil, and when the ranks are crowded he is likely to be thrust aside, his place being filled by another.

The opportunity presents itself to all who first carefully prepare themselves. Abraham Lincoln's parents were poor, so Abe not only had to work hard, but he received very little schooling. Under such circumstances most men do not try to elevate themselves put plod along as their fathers before them had done. Not so with Abe. Out of the depths of his soul a voice told him to "get out of his light," to look forward to something far more grand and noble than his present life offered. He knew in order to attain this end—*he must work*. Thenceforth he became animated with a new spirit and put all his energies into the new work. His motto, which he faithfully kept was, "I will study and prepare myself, then perhaps the opportunity will come." The opportunity did come, and Abe was prepared; he became its master in spite of adverse circumstances. Some one has wisely said: "God gives every bird its food, but does not throw it into the nest." And so it is with man. Each man has a special work to do; but if he wishes to be successful in it, he must carefully prepare himself, as did Lincoln. He must have the power to concentrate, and (if the editor of the Nook will allow me to coin a word), he must have that admirable quality which we will call "stick-to-it-ness." Horace Greeley's advice to young men was "Go West." That was when the west needed young men. It now has young men of its own. Today the field is not the west, it is the *world*. If Horace Greeley were living today, his advice would probably be "Young man, get out of your light."

## THE TUFTED TITMOUSE.

MRS. M. E. S. CHARLES.

ONE of our most sociable birds is this same tufted Titmouse, or sugar bird as he is more commonly called by country people. It is about the size of the English sparrow, but rather more slender. The male and fe-

The Titmice are among our most active birds. To see a flock of them taking a bath in a shower of rain is a scene not soon forgotten. One morning in last March, ten of these birds were in the top of an apple tree during a heavy shower. They were tumbling about among the branches like trapeze performers; one instant fluffing up their feathers that the drops might filter through; the next turning summersaults in the air, lighting on the branches, twittering with delight.

The range of these birds extends throughout the United States, east of Texas and south of the Connecticut Valley. It is said they are rarely seen so far north as New England. They are not regular migrants, most of them remaining throughout the year where they have taken up their abode.

In winter perhaps no bird is more abundant in the wooded portions of central and southern Indiana and Illinois, than this species. Roving in restless, noisy troops through the woods, scolding at every intruder and calling to one another in unmusical tones, it soon renders itself conspicuous and easily recognized. Its ordinary note is a monotonous "da-da-da" often repeated. But its spring song is a loud, clear whistle of "peto, peto, peto peto," and no other song of the birds is more welcome, for it is the harbinger of spring and sugar-making. Mr. James P. Baskett says this "spring song is that sugary sap-rising call to 'Peter-peter-peter' to get out his spiles and sugar troughs."

The Titmouse is a great hunter of insects, not only over the bodies of trees, but through low shrubbery and even on the ground. It will also come close to the house for a bit of bacon. A few years ago I read how the Titmouse came to the unchinked log smokehouses of the early settlers and "dug into the hams and mid-

male are alike in color, size and appearance. Both have a high and pointed crest, and are of an ashy color above, whitish below and with a streak of rufous on the sides partly hidden by the wings, and a black band crossing the forehead. The feathers of the head are long, and, when the bird is excited or angry, can be raised into a conspicuous crest, whence the common name of tufted Titmouse. From the black bar across the forehead it is sometimes called the black-fronted Titmouse, while its Latin name is *Parus bicolor*, the former word meaning "Titmouse" and the latter "of two colors."

"When the tardy sun, in  
winter,  
Briefly shines—a blossom hin-  
ter—  
To a tune, first sweet, then  
sweeter,  
Sings the Titmouse: 'Peter,  
Peter!'  
And when maple sap is fall-  
ing,  
Then he magnifies his calling,  
As in clear notes repeats he:  
'Peter, Peter, te, te, te, te.'"

pecks at it vigorously. My presence seems to make no difference to him. Indeed, these are sociable birds and seem to enjoy the company of man.

As stated before they winter in flocks, but when spring comes these winter bebies separate; and each pair seeks some natural cavity such as a hollow in the fork of a tree or a deserted hole made by a woodpecker. This is lined with bits of moss, leaves and grass, and in it are deposited the four to six eggs. In color the eggs are white, sprinkled with reddish-brown and lilac. Often two broods are reared in one season.

## Leprosy

(Continued from page 221.)

will die of gangrene or some other terrible complication. On the other hand, if that same leper is in Molokai, the surgeon will operate upon the foot, remove the ulcer, cleanse the bone, and put a complete stop to that particular ravage of the disease. A month after the operation the leper will be out riding horseback, running foot races, swimming in the breakers, or climbing the giddy sides of the valleys.

Leprosy is as old as history. References to it are found in the earliest written records. And yet today practically nothing more is known about it than was known then. This much was known then—namely, that it was contagious and that those afflicted by it should be segregated. The difference between then and now is that today the leper is more rigidly segregated and more humanely treated. But leprosy itself still remains the same awful and profound mystery. A reading of the reports of the physicians and specialists of all countries reveals the baffling nature of the disease. These leprosy specialists are unanimous on no one phase of the disease. They do not know.

They are baffled in the discovery of a serum wherewith to fight the disease. And in all their work, as yet, they have found no clue, no cure. Sometimes there have been blazes of hope, theories of causation and much-heralded cures, but every time the darkness of failure quenched the flame. A doctor insists that the cause of leprosy is a long-continued fish diet, and he proves his theory voluminously till a physician from the highlands of India demands why the natives of that district should therefore be afflicted by leprosy when they have never eaten fish, nor all the generations of their fathers before them. A man treats a leper with a certain kind of oil or drug, announces a cure, and five, ten, forty years afterward the disease breaks out again. It is this trick of leprosy lying dormant in the body for indeterminate periods that is responsible for many alleged cures. But this much is certain: as yet there has been no authentic case of a cure.

HE who does not give, does not live.

## CURRENT COMMENTS

### HARD TIMES FOR LUMBERMEN IN THE NORTH-WEST.

The railroads penetrating the lumber regions of Idaho, Oregon, and Washington recently made a raise in freight of \$3.50 per thousand feet of lumber. This knocks the lumbermen of this territory out of competition in the eastern states with lumber from Minnesota and the southern states.

As a result of this arbitrary ruling by the railway companies the mills and forest hands of the northwest are idle and will remain idle until the shippers can regain their old rate. Congress has a bill under consideration at present which specifies that no freight rate for interstate traffic can become binding until the shippers have the privilege to be heard on the question.

In the past the railroads could discriminate against, or in favor of, any section of country they pleased and throw the entire force of laborers and capitalists out of business. Canada has equalized railroad rates for many years by a board of railroad commissioners, who make rates for all the railroads. We trust to see the contention between the shipper and the carrier placed upon a more equitable basis by the present Congress than ever before. Unsettled business relations have been a great hindrance to progress in the past.

\*\*\*

### THE RIGHT OF THE EMPLOYER TO DISCHARGE MEN.

The Supreme Court has made two decisions recently which hurt the labor unions. In the first, the so-called Adair case, the court ruled by a six to two vote, Justice Moody not voting, that the clause in the Erdman law of 1898, which forbids railroads or other carriers engaged in interstate commerce to discriminate against or discharge employes because of their membership in labor organizations was unconstitutional, "an arbitrary interference with the liberty of contract which no Government can legally justify in a free land." The case was brought by the Louisville and Nashville Railroad in order to test the law. William Adair, a master mechanic of the road, for the purpose of attacking the law discharged O. B. Coppage, a fireman, because he belonged to the Order of Locomotive Fireman. That organization took up the matter, Adair was indicted under the Erdman law, and convicted and fined \$100 by the Federal court in eastern Kentucky, which upheld the constitutionality of the law. The company made the plea that the law interfered with the liberty of contract and was class legislation. The Supreme Court held that in the absence of a contract the law could not compel any employer against his will to accept or retain the services of any employe, nor could it compel any employe against his will to perform service for any employer. Such a decision would apparently make impossible any compulsory arbitration law, no matter how much advantage such a law would be to the country. Altho the sentiment that no employer or employe should be forced against his will to hire or perform service sounds unexceptionable, yet in New Zealand, where under the compulsory arbitration law employers have been ordered to employ union men rather than non-union, other things being equal, and employes are forbidden the right to

strike the welfare of the state has been promoted by the limiting of the freedom. Full liberty is enjoyed by the lone savage in the wilderness. The development of civilization is the story of the surrender of liberties for the sake of the common good.

#### HOW JAPAN HOLDS TO HER EMIGRANT SONS.

A Canadian writer who recently visited Japan in the interest of immigration says:

The evidence goes to show that the naturalizing of Japanese in Canada, even when all the details are carefully observed and the processes of law strictly followed, is a travesty, and the oath of allegiance a meaningless formula. A Japanese may take the oath, but it has no binding significance for him, because in the matter of citizenship he is not free either to renounce his old allegiance to Japan or to make good any new pledge to Canada. His country is his god, patriotism is his religion, and he is bound, not only by his own personal sense of loyalty, but even more inextricably by the heavy bonds given to the Government of Japan before he could emigrate, and in which the property and rights of his friends at home are involved, and he must remain bound, in his allegiance to Japan, to hold himself in readiness for his country's service at any time the authorities of Japan may issue the call.

It is asserted on authority that every Japanese in America is on the official record in Japan, his movements regularly reported, and his friends bound in heavy penalties to restore him to the Government officials at any time he may be required. That being so, the processes of naturalization in Canada and the oath of British allegiance are of no more significance to a Japanese than is the change of costume made convenient by the change of climate or the adoption of Canadian currency or style of cravat.

#### SECRETARY TAFT AND THE NEGRO VOTE.

Most Americans do not know the depth of resentment against President Roosevelt roused among many colored people by the dishonorable discharge of three companies of colored troops on the charge of shooting up Brownsville. According to the negroes themselves, nothing has aroused them so since reconstruction days. Their opposition to the President is so intense that they will oppose any man who is popularly supposed to be named by Mr. Roosevelt as his successor. Three of the leaders of the portion of the race which believes in fighting directly for its rights, Bishop Alexander Walters, president of the Afro-American Council; the Rev. William H. Scott, president of the Negro Suffrage League, and William Monroe Trotter, of the New England Constitution and Suffrage League, have issued a call to the negroes of America to send representatives to a convention to be held in Philadelphia on April 7 for the purpose of putting the negroes on record as opposed to what they term "the positive and notorious hostile attitude of the Government of our republic toward its citizens of color under the present Republican Administration," and also to express their opposition to the candidacy of Secretary Taft. In support of the charge of hostility toward them, on the part of the present Administration, they refer to the President's order that negroes as a class should receive a different sort of education from white men and to his charge that negroes concealed criminals of their race. Besides Secretary Taft's endorsement of the Brownsville discharge, they hold against him his advice to negroes given at Louisville, to accept

conditions as they are in regard to the franchise and to trust to the developments of time. The negro voters have of course, been almost altogether Republicans. In 1900 they held the balance of power in Idaho, Indiana, Kansas, Montana, Oregon, Washington and West Virginia. Their defection from the Republicans would make it impossible to carry Missouri, Kentucky or Maryland, which are doubtful states. Negroes are preparing to attempt to appoint colored delegations from the Southern states, where the bulk of the Republican party is composed of colored men. In Florida already contesting delegations, one pro-Roosevelt and one against the President and Secretary Taft, have been appointed. If the negroes control a good proportion of the two hundred odd delegates from the South they would probably have the balance of power in the Chicago convention.

#### BRYAN PREACHING TO WALL STREET.

On the question of watered stock and fictitious capitalization, Mr. Bryan compares those who palm off spurious securities upon the market to horse traders who doctor up a worthless animal and by concealing his defects sell him to some unwary purchaser. Of Wall Street operations he says:

"Gambling is one of the worst of vices, and gambling in stocks and farm products is the most destructive form in which the vice appears. Measured by the numbers of suicides caused by the New York Stock Exchange, Monte Carlo is an innocent pleasure resort by comparison. Measured by the amount of money changing hands the contrast is still greater in favor of Monte Carlo, and measured by the influence upon those who do not gamble, the evils of Monte Carlo are insignificant when compared with the evils of New York's commercial gambling houses. The New York Stock Exchange has graduated more embezzlers than Fagin's school did thieves."

He closed his remarks about such gambling with an appeal to the spiritual advisers of our great cities to "consider whether they cannot advance religion as well as morality by pointing out that the commandment, 'Thou shalt not steal' is openly and notoriously violated in the stock market and in the grain pit by those who profess to believe in the Bible and to have respect for its teachings." His appeal is good and recalls the name of Daniel Drew, the founder of Drew Seminary, a benevolent and religious minded man, who made much of his money on Wall Street. It is recorded in the "Reminiscences of Richard Lathers," that, at one time, Mr. Drew, under the influence of an eloquent appeal, subscribed more than he could afford. But, as he said, when he narrated his experience afterward in class meeting, he prayed over his difficulty and rose from his knees confident that all would come out well. And so it proved, for, said he, "The next morning, when I went down to my office, I fleeced those fellows out of twice the sum I needed."

#### BETROTHALS TO BE WRITTEN AND WITNESSED.

That all engagements to marry must be in writing is the ruling of Bishop Richard Scannell of the Catholic diocese of Northern Nebraska. The prelate orders that the documents must be witnessed by two persons, and instructs his priests not to perform the marriage ceremony if these formalities are not complied with. He declares that engagements have come to be looked upon so lightly that this ruling becomes necessary. It is effective after Easter Sunday.

# THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## PUTTING THE BEST SIDE FORWARD UPON FIRST ACQUAINTANCE.

It is appropriate to be friendly to a new acquaintance and possibly it is useless to try to even wish to change the common tendency to make an exhibition of one's good qualities to a stranger, but with this human trait there is a counterpart which is not commendable from any consideration. That counterpart is the general disregard for the hidden or private acts and conditions of our hearts or surroundings.

A swell stone front; exquisite artistic designs in the architecture, the furniture, and the lawns all perfect. But the back yard! Just anything, anyway, and no way at all. Now this is a true picture of real life. We try to establish credit and gain a worthy place by living a two-faced life, and the contrast between the front and back yard is not as despicable as the front and back appearances of our hearts and lives.

Do not pretend less goodness, but do possess a more uniform character thruout. If you smile at an introduction, let that smile bespeak an inner friendliness. If you boast goodness, let the assertion be exemplified by a record of charity to all classes. Cultivate the talent to grow in the estimation of those who know you best. It is not the first but the last impression that counts.

## HOW THE WORLD GROWS BETTER—NO. 1.

CHANGES, both gradual and spasmodic, both temporary and permanent, have marked our course as a race. The deeds have not all been good, nor all bad. The ages have not always shown an outward improvement on the past, but somehow, somewhere and in some way, there has always been a leavening power in society working for and toward righteousness. It cried out against slavery, it cried out against tyranny, and it cries out today, against intemperance and vice. When a nation or an age degenerated, this moral power invariably caused a revolt, a cleansing, or else

annihilation. Just as air, and water, and the human body throw off their refuse matter and become pure thru activity so the soul of man maintains its health and strength by constant activity in righteousness.

To say that the race has become inherently better is a mistake, but to say that the race has recognized many of the mistakes of the past and has always endeavored to avoid repeating them is true. Whether the desire to be better and the effort to become such is stronger now than when the ancients became penitent and resolved to do better is not capable of being solved, but the seed of sin lives and reigns in human flesh today the same as it ever did and ever will, so that the elements of character remain the same. For this reason outside measures, such as legal restraint and self-preservation, have become the gauge of the world's goodness.

Restraint is a world power, today, of immense value to humanity. When other nations made it too warm for King Leopold's reign in the Congo Free State of Africa, he released his rule and the natives will now fare better and not lose any more hands, feet, ears, and suffer such other atrocities. When slavery became too brutish the United States put an end to the business so that several million people were restrained from that form of evil. Prison walls keep tens of thousands of people from doing wickedness today, while social ties bar many more from indulging their evil propensities. The police system and the penal code of our states continually stare millions of people in the face and hinder, or at least, guard them against doing wrong. If it was not for this, that, the other, and so on, not many people would do right continually.

The Bible itself is a law of restraint. "Thou shalt not" thunders eternal vengeance in our ears day and night. The sword of justice hangs directly over our heads, suspended by the little cord "if." Break those two letters and the keen, sharp edge of that sword will cut our being asunder.

After restraint, as a bulwark to righteousness, comes self-preservation. Much of the world's goodness will be found under this heading. Political candidates will do almost anything to further their popularity. Political parties advocate any measure which insures them success. The nations make alliances with former enemies in order to strengthen their positions. As a witness to this, note the Anglo-Russian treaty of last year as regards Persia.

The peace sentiment of today is not so much a religious sentiment as it is an economic question. The European governments are staggering under their tremendous national debts and their peasants are revolting at the ever-increasing rate of taxation. The rulers are facing a revolution on the part of the laboring classes, and for this reason they are trying to appease the just wrath of the poor and retain their support, by pretending to lessen the need of armament.

The rulers are no less selfish. They would fight for any cause if they saw a sure chance of winning. If war could be engaged in without hazard and expense it would be the favorite pastime of rulers.

In conclusion and as an introduction to future papers on this question, we assert that restraint and self-preservation as preventives of crime are the ground work upon which humanitarianism and righteousness will develop, for already there are signs that so far as the evil in man is checked the good in his heart will correspondingly strengthen. What the progress has been we cannot measure, but a few items can be named which show moral progress and a greater asset of fraternal fellowship than ever before. Whether it is all the result of policy or the fruit of principle will be left with the reader to judge.

#### ALL THREE FOR \$1.25 INSTEAD OF \$2.50.

WE announced last week that the text-book on Esperanto would alone cost one dollar. We have made arrangements since then to give a paper-bound Esperanto text-book, a monthly Esperanto journal for twelve months, and the INGLENOOK one year, all for one dollar and twenty-five cents. Any one can see that this is an exceptionally cheap offer, to say nothing of conducting lessons thru the INGLENOOK for several months free. Every young and middle-aged reader of the INGLENOOK ought to secure a few new subscribers among their friends so that they could share in this good offer. By the first mail, after the other offer was made, word came that classes were being organized in Kansas and Illinois. Let us have an enthusiastic Esperanto class.

#### BEGINS AT THE WRONG END, SAYS JUDGE CLELAND.

ACCORDING to Municipal Judge McKenzie Cleland, the father of the parole system in the Maxwell Street police district of Chicago, "the easiest time to reach a man's heart is when he stands in court charged with crime, alone and friendless. That is the time to save him. That is when he is easiest to convert and reform. That is when the minister of the Gospel should speak to him of Christ.

"But we do not do any of these things under the present system. We send the men to the penitentiary, and then, when the man is bitter against the state and society, we hire a chaplain at so much a month to talk to him about God's love."

#### Begin at the Wrong End.

"We begin at the wrong end in a number of things in this country. We have taken the Bible out of the public schools and put it into the penitentiaries.

"Most of the crime is directly caused by the saloon. The state is rather inconsistent in its attitude toward the criminal. It licenses the saloon with one hand, and

with the other hand punishes the poor man who gets into trouble through drinking.

"The parole system which I put into force at the Maxwell Street station was simply a sincere effort on my part to administer justice in a Christianlike manner. I maintain that the system is legal and that it was a success. It decreased crime in the district, it decreased drunkenness, it restored mothers to their children, it sent fathers back to their families, and it saved the city money."

#### Declared System a Success.

"The police, the state's attorney, the lawyers and business men in the district declared my parole system successful, and I regret that its operation was suspended by my transfer to another court. If I thought it was not legal or that the law prevented a judge from helping a man charged with crime to reform, I would move out of the state and never come back until the laws were changed."

#### MY CASTLE IN AIR.

BERTHA M. NEHER.

I played, as a child, by a murmuring stream,

Where fancy ran wild in a beautiful dream,

In which I saw plainly, in visions most fair,

A beautiful, wonderful Castle in Air.

Its magical rooms were so large and so grand;

A fairy Queen ruled by a touch of her wand;

And fairies and children in happiness rare,

Were made to inhabit my Castle in Air.

But time in its fleeting, my vision dispelled:

The fairies were out of my castle expelled:

Yet often I saw it illumined, still there,

In maidenhood's fancy, my Castle in Air.

In revery often, through hallways so grand,

With knights and fair ladies I roamed hand in hand;

Or musing in silence, not thinking of care,

I builded with rapture my Castle in Air.

Too soon though time found me to womanhood grown,

And many bright dreams of my childhood had flown;

Life now was more real, though still when I'd dare

To look, I saw clearly my Castle in Air.

Its turrets and towers no more could I see,

In which my bright fancy once revelled so free;

But windows whose luster the crystals might share,

Still gleamed from the walls of my Castle in Air.

But years in their passing, how swiftly they add

The multiplied duties—some happy, some sad!

So less and less often the time I can spare,

To wander at will through my Castle in Air.

But still there are times when I tire of the strife

With evil temptations that enter each life;

Instead then of giving up all in despair,

I go for a rest to my Castle in Air,

And wander again as in days long ago,

Through scenes that are only a vision, I know,

But yet, when my spirit goes wandering there,

I come back refreshed from my Castle in Air.

Milford, Indiana.

## Lullabies

Catharine Beery Van Dyke

THERE comes a time—in fact the time is often opportune—when melody and song become an important element in child training. God made but very few people who are not capable of discerning and using pitch.

Music is the language of love, prayer and praise—a language not confined to the human family alone, but it is given also to beasts and birds and insects.

Who has not listened, either with sadness or delight (for all are not impressed in the same way by music), to the chorus of frogs down in the meadow pond in the long, early spring evenings when the air is filled with the smoke of bonfires from the door yards, stock fields and clearings. Who has not regarded with something of awe the uninterpretable “hoot, hoot” of the lazy, deceitful owl also in the long, quiet solemn evenings? And with these nocturnal vocalists may also be classed that splendid bird whose sweet, though monotonous and somewhat personal strain is: “Whip-poor-will. Whip-poor-will!” and that busy, absorbing, objectionable insect, the mosquito, with the larger ones whose serenades are so marked when summer is declining—the musical cricket and the katydid?

The lowing of the cow, accompanied by the artificial (and superficial) bell is one of my musical memories. The parental neighing of the horse, down to the satisfied grunt of the hog, the purring of the comfortable cat (one little boy said his cat sang alto), and the wicked squeak of the tiny mouse all express the musical language idea.

But to man alone is given the power to compose his own songs—words and melody, sweet or sad or joyous. Since this power to produce melody is so universal, we may set it down that there is a divine purpose in it, and that the proper use of it will magnify the qualities, nature and name of our Creator.

Oh, music, sweet music, whose chiefest charm lies in its own expression!

“I sing because I love to sing,  
Because instinctive fancies move,  
Because it hurts no earthly thing,  
Because it pleases some I love,  
Because it cheats night's weary hours,  
Because it cheers the brightest day,  
Because like prayer and light and flowers,  
It helps me on my weary way.

“Because above the changing skies,  
The Spirit saith good angels sing.  
Because, wherever sunshine lies,  
The woods and waves with music ring.  
Because amid earth's Babel voice,  
All happy things that go or come,  
Give to their grateful hearts a voice;  
Then why should I alone be dumb?”

With the little “All About” song, spoken of in a previous paper, the mother may begin to teach her child music and its meaning. How naturally she takes the little one in her arms and sings that ancient lullaby so familiar to English speaking mothers, and destined to be as immortal as the other “Mother Goose” jingles:

“Hush-a-by baby upon the tree top,  
When the wind blows the cradle will rock;  
When the bough breaks the cradle will fall,  
Down comes rock-a-by baby and all.”

In this the word “baby” may be the first to become intelligible to the child. Another equally inspiring, though a little more ambitious is this:

“Rock-a-by baby, thy cradle is green,  
Father's a nobleman, mother's a queen,  
Sister's a lady and wears a gold ring,  
Brother's a drummer and drums for the King.”

Here other members of the family are introduced and will soon be recognized. While I do not advise that mothers should make a practice of rocking their babies to sleep, there will be found many other opportunities to sing to the child or to the children.

A sweet little childish song will often cure a fall, a disappointment, or a heartache as well as soothe the over-wrought little brain and nerves. A long time ago a friend of mine had a dear little son of less than four years. When hurt or tired or sorrowful he would come to her and say: “Burden down, mamma, burden down.” She always knew he meant: “One sweetfy solemn thought.”

“Nearer the bound of life,  
Where we lay our burdens down,  
Nearer to leave the cross today,  
And nearer to the crown.”

Here the idea of heaven or rest is received. Many of you will perhaps recall the tender little meaningless

ditty that one of "Helen's Babies," always called for when his feelings were hurt:

"Toddy one boy day," etc.

While the children do not always—indeed they may seldom—get the grammatical meaning of the song, yet either the tune, time or some words of it will be caught and will "reach the spot" in the broken little heart or the receptive brain and will give comfort and peace.

"What is the road to 'Slumberland,'  
And when does the baby go?  
The road lies straight through mother's arms  
When the sun is sinking low.

"He goes by the drowsy 'Land of Nod,'  
To the music of 'lullaby,'  
When all the lambs are safe in the fold  
Under the evening sky.

"Two little tired, satiny feet,  
From the shoe and the stocking free,  
Two little palms together clasped  
At the mother's patient knee.

"Some baby words that are drowsily lisped  
In the tender Shepherd's ear,  
And a kiss that only a mother can place  
On the brow of her baby dear.

"And close and closer the blue-veined lids  
Are hiding the baby eyes,  
As over the road to 'Slumberland'  
The dear little trav'ler hies.

"And this is the way through mother's arms,  
The precious darlings go,  
To the beautiful city of 'Slumberland,'  
When the sun is sinking low."

Words, Mrs. Mary D. Bine. Music, Geo. F. Root.  
John Church Co.

In this sweet song the words "Slumberland," "Lullaby," "Mother," "Tender Shepherd," are developed and will soon be grasped.

The words of the following sweet fairy song were written by Eugene Field. Music by John Hyatt Brewer and published by Arthur P. Schmidt, 136-5th Ave., N. Y. The first line is its title:

"The Rock-a-by Lady from Hush-a-by street,  
Comes stealing, comes creeping;  
The poppies they hang from her head to her feet,  
And each hath a dream that is tiny and fleet,  
She bringeth her poppies to you, my sweet,  
When she findeth you sleeping.

"There is one little dream of a beautiful drum  
Rub-a-dub, dub—it goeth;  
There is one little dream of a big sugar plum,  
And lo! thick and fast the other dreams come  
Of pop-guns that bang, and tin tops that hum,  
And a trumpet that bloweth.

"And dollies peep out of those wee, little dreams,  
With laughter and singing;  
And boats go a-floating o'er silvery streams,  
And stars peek-a-boo, with their own misty gleams,  
And up—up and up—where the Mother Moon beams  
The fairies go winging!

"Would you dream all these dreams that are tiny and fleet?

They'll come to you sleeping.

So shut the two eyes that are weary, my sweet,  
For with poppies that hang from head to her feet  
The Rock-a-by Lady from Hush-a-by street  
Comes stealing, comes creeping."

The charm words in this are, "poppies," "dreams," and "Mother Moon." Then this one so sentimental, yet so touching that I can scarcely read it or sing it without tears:

### My Baby's Kiss.

Words, M. E. Rourke. Music, L. Peasley.  
Frank K. Root & Co., Chicago, Publishers.

"Press your ruby lips to mine, Baby, baby dear,  
Dripping red with rosy wine, Baby, baby dear.  
Laughing limp of dimpled bliss  
Hold me tightly—just like this—  
While I tell you of your kiss, Baby, baby dear.

Chorus:

One, two, three, four, five, six, seven,  
One for every day,  
Like a letter sent from heaven,  
Postage yet to pay.

May I never miss that letter with its load of bliss  
There is nothing sweeter, better, than my baby's kiss.

Does my little darling know, Baby, baby dear,  
As each year you older grow, Baby, baby dear,  
That the day is coming, when  
You'll be big like other men?  
I will be the baby then, Baby, baby dear.

For occasion such songs as the following will serve a good purpose:

"We'll camp a little while in de wilderness,  
Few days, few days;  
We'll camp a little while in de wilderness,  
An' den we'll all go home.

"You'd better b'lieve de Bible,  
You'd better b'lieve de Bible,  
You'd better b'lieve de Bible,  
An' den we'll all go home.

"We'll shout a little while in de wilderness,  
You'd better be a praying, and  
You'd better be a marching," etc.

### Climb Up, Ye Chillun, Climb.

"Jacob dreamt he saw a ladder  
Reachin' to the sky,  
Angels goin' up and down it.  
Climb up, chillun, climb!

What a show to get to heaben, what a happy time!  
Don't I wish I bin dar, honey?  
Climb up, chillun, climb!

"If I had a golden ladder,  
Reachin' to the sky,  
I would shinny up to heaben,  
Climb up, chillun, climb!

I'd shake han's wid Moses, Aaron, an' de circle jine,  
Sing de songs among de blessed,  
Climb up, chillun, climb!

"'Lija didn't need a ladder  
Reachin' to de sky;

Up to heaben he was carried,  
Climb up, chillun, climb!  
Get ye ready, all ye bredren, for de happy time,  
When we'll be as white as angels,  
Climb up, chillun, climb!

Chorus:

Climb up, ye little chillun,  
Climb up, ye older people,  
Climb up to the sky!  
Now is your chance for heaben,  
Go up in six and seven,  
Climb up, ye chillun, climb!"

Such songs as these can sometimes be conveniently substituted for the "strap" and to my mind it is one case in which the "substitution" is better than the thing itself.

Then back to the sober ones again.

Here is one which papa should appreciate. A graphic picture of the true family tie:

#### Lullaby, My Darlings.

Words, Wm. H. Gardner. Music, Harry J. Ballou.  
Oliver Ditson Co.

The lights are lit across the hall,  
I hear the children's mother call  
"Oh, come each little sleepy head,  
It's time you all were safe in bed."  
And when they toddle up the stairs  
And mother hears them say their prayers,  
And as the cot she lingers by  
She sings to them this lullaby.

Refrain:

Lullaby, my darlings,  
Sleep sweetly tonight.  
Hush-a-by my babies, my angels of light,  
God guard and keep thee, my children so dear,  
Sleep my little darlings, there's nothing to fear.

Each little head is buried deep  
Within the spell of gentle sleep;  
Each sparkling eye and smiling face,  
Seems shining with a heavenly grace  
As mamma looks upon her dears,  
So free from grief or pain or fears.  
She softly sings the lullaby,  
And watches them with happy eye.

Then down the stairs she softly goes,  
Still thinking of each darling rose,  
She whispers, "Papa, come and see  
Our darling little sleepers, three."  
The father looks in loving pride,  
Upon his loved ones, side by side,  
And looking upward to the sky  
He murmurs mother's lullaby.

The following I have just clipped from the *Chicago Daily News*:

#### Sleepy Time.

Good night, little baby;  
I've counted your toes,  
I've kissed all your fingers  
And rumped your nose.  
Good night, little baby;  
The day's gone away;

The big, tired darkness  
Doesn't know how to play.

Good night, little baby;  
My arms are the bed,  
My heart is the pillow,  
My love is the spread.

There are many sea or sailing songs that make beautiful cradle music. The sentiment may not be adapted to infants, but the rythm and melody have a pacifying effect. Such are: "Sailing," "Nancy Lee," "Rocked in the Cradle of the Deep," and "We Rock Away, O'er the Billows Gay." My collection of lullabies would not be complete—though many others are left out—without the quotation of Alfred Tennyson's beautiful lines:

"Sweet and low, sweet and low,  
Wind of the western sea;  
Low, low, breathe and blow  
Wind of the western sea.  
Over the rolling waters go,  
Come from the dying moon and blow,  
Blow him again to me,  
While my little one, while my pretty one sleeps.

"Sleep and rest, sleep and rest,  
Father will come to thee soon,  
Rest, rest on mother's breast,  
Father will come to thee soon.  
Father will come to his babe in the nest,  
Silver sails all out of the west,  
Under the silver moon,  
Sleep, my little one, sleep my pretty one, sleep."

\* \* \* \* \*

"Dream the Dream That's Sweetest."  
"Over the Stars there is Rest."  
"Now the Night Is Come."  
"Child's Evening Hymn." (Kindergarten.)  
"Manchester," in Brethren Hymnal.  
"What Are the Wild Waves Saying?"  
"Annie Laurie."  
"Flow Gently, Sweet Afton."  
"Dream Faces."

And the glee hymns of Christendom of which there is such a splendid collection with many more form a treasury of baby and child songs; and the mother's wise selection may be one of priceless value.

I close this chapter with a lullaby more highly prized by me, perhaps, than any other one because I learned it and used it for our firstborn; sometimes in sadness, sometimes in joy.

#### Gently Rest.

Words, Walter Powell. Music, Kucken.

Gently rest, the night stars gleam,  
Soft thy slumber, bright thy dream;  
Fear no harm for I will keep,  
Watch with love while thou'rt asleep.

Let but angels whispering tell,  
In thy soft dream where they dwell,  
In that land where no decay  
Steals the flowers they love away.

Ah, 'twere vain to tell thee now  
Of the love my heart can know;

Only now for thee I pine,  
All a mother's love is thine.

Refrain:\*

Oh, hush thee now, in slumber mild,  
While watch I keep, oh, sleep, my child.

#### THE HOME DAUGHTER ON THE FARM.

A GIRL wrote to me the other day from her farmstead home in the Middle West. On the day that she wrote her sky was indigo, and she felt as if imprisoned in a London fog. The bright, busy school days had gone, and she was living in a round of monotonous duties, performing tasks that did not appeal to her, and with the impatience of youth, feeling that there would never be an end to her present flavorless existence. The daily drudgery was irksome. She realized that she had drifted away from her mother, and that their views were not in harmony. She wanted independence and had not a cent in her purse. Sweeping and dusting, cooking dinners for hungry hired men, occasionally driving to the village on an errand, and seldom varying the routine except by a call on a neighbor, my correspondent felt that nothing was worth while, and declared that at times she was on the verge of hysteria. Her mother had accepted the drudgery and monotony, and had grown used to it, but the daughter was very sure that it was the wrong life for her. Still she felt bound to it as by iron fetters, for, as she confessed, her mother was in breaking health, and domestic help in that region was not to be found for love or money. What should she do?

My answer to her and to others in a similar situation is, that a manifest duty is never insupportable. Things that ought to be borne can be borne. As for the pin pricks incidental to having no money of one's own at command, they are annoying and exasperating, and it is sometimes right to make a stand and insist upon an allowance. Still, if a daughter remembers that she has received from her parents every essential in clothing, education, comfort and luxury, so far as their means have allowed, it need not be regarded as a calamity that she must still ask for what she wants.

I wish I could persuade this lonely girl, who in her home suffers the pangs of homesickness for a cheerier life, to believe and expect that something unforeseen and very pleasant may be waiting for her at the next turn of the road. The homely proverb says that it is "a long lane that has no turning." Have patience, dear heart. The sun will presently drive away the fog, and a golden light replace the present gloom. To make the best of any situation is the truest wisdom. Suppose, for an instant, that you could indulge your own fancy, and leave your mother and father, and the rest of the folk you really love, to endure hardness without your help. Could you find unalloyed satisfaction in turning away from what you ought to do, to what you would prefer? Deep in your womanly heart there

is a voice that answers "No," if you are candid with yourself.

Life on a farm is by no means shorn of pleasure to country girls in general. I talked with one a while ago, and I cannot forget her radiant face as she told me that each season of the year was more delightful than the other, and that in winter, when the snow lay white over the landscape, there were merry-makings, sleigh-rides, gatherings of the clan, and pleasant times among the young people; that afforded a great deal of variety; so that to use her own words, "the winter whirled away like an express train." This home daughter spoke of the long evenings for music and reading, alluded to the correspondence study that she found fascinating, and observed that the telephone in the farmhouse brought it into swift communication with even distant neighbors, and with the world beyond its door. She was a gay, buoyant girl, and I am glad that she is not exceptional among the daughters of the countryside.—*Margaret E. Sangster.*

#### WHERE DID THE FROGS COME FROM?

FOLLOWING the toad and rattlesnake stories, we come to a rather common occurrence, altho it is as mysterious as it was when the frogs of Egypt first bothered Pharaoh.

After a heavy downpour of rain countless thousands of young water frogs of nearly uniform size have been known to cover the ground in different localities. Conservative men and women have witnessed such freaks.

Were the young frogs hidden away in the trash on the ground, just ready to jump, before the rain came, and did the warm water make their joy so great that they could hide no longer? Or were they rained out of the clouds? Where that one particular rain did not fall there was no evidence of frogs, and the frogs were too numerous, by far, to be the result of breeding on dry lands, so that they were imported from some unknown place. Could frog ponds, containing millions of larvae have been sucked up into the air by a cyclone and the eggs have hatched in the dense moisture of heavy clouds and then have been rained down again? There are many known instances where cyclones have drawn water out of rivers and deposited it over the country with a fair sprinkling of fish.

#### A NEW ELECTRICAL USE.

To determine when wire hoisting ropes have depreciated beyond the limits of safety has been a difficulty of mining engineers, and to avoid risks—in the absence of exact tests—many ropes have been doubtless discarded while still in fairly good condition. The strength of the ropes is now gauged by a new use of electric induction. The ropes are passed through a coil of copper wire traversed by an alternating current, and the variations of induced current—which exactly correspond to changes in the thickness of the rope—are recorded on a suitable instrument. Dangerous wear or broken strands cause the indicator to give warning.

# Glencoe, or the Drug Evil in the Family

## A True Story

Armelia L. Colwell

FOR many years the broad, rich acres and the old-fashioned massive buildings known as "Glencoe" had passed from father to son until, at last, it belonged to Ernest Lee. Neither time nor money had been spared to make the house and grounds the most beautiful spot for miles around, and the quiet which forever reigns in this quiet spot seems not unlike the deep hush of a Sabbath morning.

Ernest Lee was a devoted Christian worker, and when he married a woman, Jane Curtis, who never attended church but openly declared religion to be all nonsense, people were much surprised at his choice. His aged pastor Rev. John Brown had many talks with him on the subject, but Mr. Lee always assured him that he felt sure of himself and that he could induce his wife to join the church. When they were first married she attended church quite regularly but took every chance to ridicule, and, in every way, tried to get her husband to stay home from church services.

Mrs. Lee had a great ambition to be rich, and altho in her marriage she had been lifted from poverty to comparative riches, yet she was not satisfied, and worked and saved all the more to get more money. She said she did not love her husband but married him because he had a good home. She never liked children, but when her three were born she loved them with an absorbing affection; and in her great love she yielded, without an effort, to them in everything. They must have what they wanted. She cared only to see them happy, vainly supposing they could be happy thru the indulgence of their whims and appetites.

Mr. and Mrs. Lee had been married twelve years when I engaged to teach the school near "Glencoe." Mabel, aged ten years, and Harry, aged seven, were two among my large number of pupils. As I passed their home on my way to school, I often called for the children. One morning Mrs. Lee said she did not think Harry could go to school, as he was not feeling well and was just eating his breakfast. It being early I offered to wait for him, and she asked me to step into the dining room.

"Harry's health is bad and he has no appetite. He will only eat a piece of fruit cake and some highly-spiced pickles," said Mrs. Lee.

"And what is he drinking?" I asked.

"Oh, that is beer, Dr. Clayton ordered it for me a year ago, while my baby was such a care to me. He said it would give me strength and I think it has, and I am now letting all three of the children drink it to strengthen them." I looked at the little two-year-old Alice, and in her pinched, sallow face could see the

effect, not only of beer but of other harmful drugs also.

"Mrs. Lee, what do you give her to quiet her?" I asked.

"Oh, I give her patent soothing syrups."

"But are you not afraid they will injure her, as they contain opium and other harmful drugs?"

"No, I always give them to my children. I never could get my work done if I did not put them to sleep. I must work extra time now, to make money for the children. If my children were only well and strong, I could save more money, but I have to pay out so much for medicine. We are each taking five or six kinds of patent medicines."

"But, do you think them a benefit to you? They all contain alcohol in large quantities."

"Well," she said, "I am not afraid of alcohol taken as a medicine; we have been using it for years, and I cannot see any harm done; but your mother is one of those W. C. T. U. cranks, and has taught you to hate alcohol, even as a medicine, but her children are all well and strong. I never heard of one of them being sick, so they do not need medicine as mine do who are sick most of the time and have such poor appetites."

"No my mother never gives her children any soothing syrups, or other patent medicines, or harmful drugs. She has them eat plain food at regular hours, such as butter-bread, eggs, and milk with cereals, and vegetables; take plenty of exercise and sleep; and have fresh pure air night and day. And my father, grandfather and great-grandmother used no tobacco or narcotics, and as you say the children in our family are never sick, only when whooping cough or some infectious disease comes around."

"My children would never eat such plain food and will cry until they get what they want. I have great trouble to find anything they will eat to put in their lunch baskets to take to school. Harry wants a bottle of cider, but knowing your temperance principles, I was afraid you would not allow it."

"No, I would not have it in the schoolroom."

"Mabel and Harry often have such severe headaches I always keep antifebine as a quick stop for headache."

"O Mrs. Lee, I think antifebine is a very dangerous drug. Are you not afraid to give it to your children?"

"No I take it myself and give it to them. Dr. Clayton says it is harmless unless you take too much at once. I try to be careful, but once I gave it to Mabel and the blood settled under her finger nails, and I

thot her heart would stop beating. I have often felt the effects of taking too much myself, but always recovered in a few hours. Dr. Clayton left me some small pills. They gave me strength to work. He has since told me they were morphine pills, and now I can buy them at any drugstore."

"O Mrs. Lee, are you not afraid you will acquire the morphine habit which is very dangerous and ends in delirium tremens and death, and God's word and advanced medical science are agreed that 'Whosoever is deceived by strong drink' whether as a beverage or medicine, 'is not wise'? I wish you would read some of the temperance books, about alcohol and narcotics."

"I am not afraid to take any medicine which I think helps me, I do not believe the Bible, nor care to read temperance books."

Let us look at the family of Ernest Lee fifteen years later. Mabel ran away from home and married a worthless man who chews, smokes, and drinks, to excess. Almost her first act after marriage was to pawn her watch and jewels for drink. She has several, small sickly children in her wretched home. She drinks beer, takes morphine, and reads cheap novels to pass away her time. Living in a city of churches she never goes there for help or comfort. A beautiful young girl to whom Harry Lee had paid some attention was asked why she did not marry Harry. He had a good home for her. Her reply was: "How can you ask? One look at his red, swollen nose, watery eyes, sore blotched face, and tobacco mouth should be your answer. I do not believe he has ever been really sober since he was born."

At the grand weeding of Alice Lee to a good man each member of the family had to take some kind of stimulant to go thru the ordeal, and wine was as free as water. A few years later Mrs. Lee in feeble health was taken ill. Dr. Clayton having died, a new physician was called and was astonished to find her in a fit of delirium tremens. She told him she had taken morphine until it did not help her, and now was taking two quarts of strong liquor daily. She lived two weeks longer and suffered tortures daily. She was always surrounded by reptiles and horrid monsters. She did not know her loved ones, and several times in her frenzy tried to kill them. She called night and day for her father, and mother, who had been dead many years. Her mind would beg for them to give her money and would sit for hours smoothing out the bills, and thus her sun set in darkest night.

Mr. Lee lived a few years a sad, lonely, broken-down man. Altho he had been deprived of the privilege of religious worship for many years his faith in his father's God was bright at the close of his life and he tried to point out to many a young man the true path which leads to the "many mansions," and thus he passed from death unto life. But today strangers

are in the halls of beautiful "Glencoe" a warning to all those who know its history, of the harmfulness of alcohol and drugs in the family.

*Wellsburg, N. Y.*

## GARDENING.

AMANDA RODDY.

COVER a piece of ground entirely, with good, rich litter, then take a spading fork and spade deep and thorough and turn it under. If the ground is not rich enough the first year scatter a little fine litter over top before raking. Cover every spring with manure and spade it under before planting, and you will soon have one of the finest garden plots. You must experiment a couple of years before you can expect to succeed very well.

Here are some good seeds for garden use: early curled Silesia lettuce—best for early sowing, dark blood-red turnip beet, oxheart carrot, Earliest of All shell peas, one quart Prize Taker onion sets, Hollow Crown parsnip seed, Wardwell's kidney wax bunch beans, a few early red radishes. When you have the ground fully prepared to plant, make straight marks along so you can plant straight. Make rows about ten inches apart for onions. Scatter a few parsnip seeds along in these rows, but take onion sets and stick them three inches apart in the row right on top of the parsnip seeds. The onions will not hurt the parsnips and you will have two excellent crops. Stick a couple rows of beets twelve inches apart. Sow a couple rows of carrots eighteen inches apart. Sow a couple rows of peas two feet apart. Two rows of bunch peas two feet apart. Leave at least twelve or fifteen inches around the edge of the bed for the lettuce, but sow the lettuce earlier than the beets, peas, carrots and beans. Stick a few radish seeds every three weeks, around the edge of bed in the lettuce. When peas are over you can plant beets and bunch beans in their place to come in fresh and tender again in fall. You can sow a little fresh lettuce every four weeks and have it tender all summer.

*Johnstown, Pa.*

## LISTEN, BOYS!

Do you know how sleigh bells are made? How are the little balls placed inside the bell? Here it is:

The ball having been cast first, is put inside a sand core, just the shape of the inside of the bell. A mold is then made just the shape of the outside of the bell. The sand core with the jinglet inside is placed in the mold, and the melted metal is poured in so as to fill the space. The hot metal burns the core, so that it can all be shaken out, leaving the ball within the shell.

WHAT'S the use of having troubles of your own when you can listen to other people's?

## DAKOTA SNOWS.

PAUL MOHLER.

It has been my duty to teach "Snow Bound" to several classes of North Dakota pupils. The first time I undertook this task, I thought I had something easy for them; but I was entirely mistaken. Whittier's snowstorm, and even Whittier's snow, was so entirely different in character from anything ordinarily seen here, that it might almost as well have been rain, for all the resemblance. Since the eastern snowstorm is so strange to the Dakota children, perhaps the Dakota snow would be interesting to those in the east.

In the first place, we never see many large flakes. The snow comes in fine particles, sometimes as fine as granulated sugar. Sometimes it is soft and sometimes icy; but it is very seldom wet enough to form a snow-ball or to pile up on anything. Consequently, it would be impossible to create such scenes as Whittier describes when he says:

"The old familiar sights of ours  
Took marvelous shapes; strange domes and towers  
Rose up where sty or corn-crib stood,  
Or garden wall or belt of wood;  
A smooth white mound the brush-pile showed,  
A fenceless drift what once was road;  
The bridle post, an old man sat  
With loose flung coat and high cocked hat;  
The well curb had a Chinese roof;  
And even the long sweep, high aloof,  
In its slant splendor, seemed to tell  
Of Pisa's leaning miracle."

One might as well try to create such effects of dry white sand as of Dakota snow.

Notwithstanding the dryness of this snow, and its granular character, it will freeze when packed. The importance of this fact cannot be overestimated. On this depends our ability to traverse the northern snows. Without the freezing of the packed snow, winter travel in Dakota would be one long flounder; with it, it is a positive delight, much of the time.

Let us see how this works. The first team through a fall of snow has no easy task. The snow is loose, to be sure, but it impedes progress just the same, and the sled draws hard; but the packed snow freezes. Then a little wind fills the tracks. The second team packs another layer, and so on until the track is hard and smooth, and, if the wind continues to blow, in a few days the road is actually higher than the surrounding snow. What a splendid highway we have then; long and level and safe to follow even in a blinding storm; reaching out across the county a score of miles in every direction. On these roads, the heavy, long runnered bob-sleds haul the crops to market. One team of good horses will draw one hundred bushels of wheat a dozen miles to market. Leave this track in a storm? Not on your life! The horse knows when his feet are on the beaten track; leave that, and down he goes in the softer snow.

The railroads, however, dread the snow. They cannot raise their road bed. Packed snow means derailed cars; a snow drift is a barrier. They must shovel the snow, and truly it is a tremendous task at times. They throw the snow from the tracks but to form drifts on each side. The higher the drifts are built, the deeper the track is covered in the next storm. They may set up snow fences to stop the snow short of the track, but in unusual winters, like the winter of 1906-7, the snow drifts over the fence, and even a second one. Then the snow itself is put to work. Long walls of snow masonry; blocks of frozen snow laid together by gangs of men along the cuts, hold back the wind-blown drift till men can but wonder at the gigantic efforts of this soulless corporation to provide for the people. Truly it is not altogether selfish.

Again, about our buildings, the snow has its peculiar forms. It generally comes with a wind; either southeast or northwest. Driven before this wind, it slides along till it finds the lee side of something. Then it stops to rest. Other snow follows suit until soon there is a long drift reaching out in the direction of the wind from each building on your premises; therefore DON'T build your house to the southeast of your barn in North Dakota, or you may have to dig out of the snow some fine morning. However, high buildings are swept clear of the snow. The wind, whirling and eddying around, will pile the snow around the building but at some distance away, leaving the doors clear of snow; quite an important point. But DON'T build them too close together or the drift formed between may be ten feet deep, thrown up on each side by the whirl of wind: "What a path to shovel!" you say. But we don't shovel paths. The wind that forms our drifts, generally packs them too, and freezes them till they will bear our weight. If not, then we soon form hard paths like our frozen roads, and over the drifts we go, and down the other side. A deep drift is a nuisance of course, but not as bad as a mud hole; and we drift climbers have no mud to scrape every time we enter the house. Just the whisk of a broom, or the slip of a rubber shoe, and we are ready for anybody's parlor.

Our snows are a good thing for the country. They make good roads in the winter; and they make moisture for the spring crops. Even the heavy snows of last winter were a good thing in the long run, for they prevented the sale of wheat at the low prices of that time, compelling the farmers to keep their crops till the price was advanced.

This has not been a snowy winter. We had some snow, but not enough for good sleighing. A dry winter has its advantages, but it also has its limitations, God gives to each region its own peculiar blessings. Perhaps the snow is ours. May we be thankful for all the good it brings.

*Cando, N. D.*

## For SUNDAY READING

### AN ANSWERED PRAYER.

IRA P. DEAN.

DURING the panic of 1894 in the midst of a terrible blizzard, with the thermometer away below zero, in a little, old house on the banks of the Susquehanna River, lived a mother and two young children. Just two years before, the father left the mother and two children, so they were living alone.

One evening, after supper, which consisted of the crusts and heels of bread left over, spread with lard, and black coffee, the mother and two children went into the front room to try to amuse themselves and forget their troubles; the children had been playing on the floor when turning to the older boy, just about seven, the mother said: "Boys, I don't know what we will do now, we have eaten the last we have, and my money is all gone. You have no shoes to go out." Then breaking into tears, she continued, "Besides, you father has not brought any money around and I haven't got clothes to go out and the snow is about two feet deep, and still snowing." Haven't we got anything to eat at all, now, mamma?" inquired the older boy.

"No, the bread box is empty and we have nothing in the house, but some of the fryings we ate on our bread." Then looking out of the window she said: "It is awful out tonight, and no one will come that we can tell about it."

"Well, mamma, let's say our prayers, maybe God will send some one around, like the stories you read to us," said the older son again. "Well, boys we will have prayer tonight, we haven't had prayer for a long time together, maybe God will hear us anyway."

The mother read a passage of scripture and then all knelt in prayer. That mother told God how they were alone and everything was eaten up; she told God just how she felt and asked him to send some Good Samaritan around to help them.

"Mamma, do you think some one will come tonight now?" asked the boys, after they arose from prayer.

"I don't know, maybe God will send some one around. We won't go to bed right away anyhow. We will wait, in case some one does come," she replied. Then, going to the organ, she played while the boys sang.

They had only been at the organ a short time, when there was a knock at the door. The singing stopped and all went to see who it was. The prayer was heard, and here stood the answer, knocking at the door.

"Good evening, Mrs. ——," said Mr. Evans, and

stepped into the room with a basketful of groceries and provisions,—bread, sugar, rice, potatoes, coffee, butter and everything that was needed. The family asked him to stay awhile, but he said he had another basketful he wanted to bring and he would have to get it before the store closed.

He was gone only a short time, when he returned with the other basket laden with supplies. Everybody was happy then.

"Whoever made you think of us, Mr. Evans?" asked the mother.

"Well, I don't know," replied Mr. Evans. "I was sitting in the sitting room beside the fire, reading the evening paper, and all at once I just thought of you, and wondered if you might need coal or food. I tried to read, but could not get interested. I looked out and saw it was snowing, then I thought perhaps you might be snowed in and have nothing to eat. So I put on my coat and hat, told my wife how I happened to think of you, and said I would go up to the store and get some things and take them around, so that's all that made me come. But I'm glad I came. I am going to send coal around in the morning. You just let them put it in, it's paid for and you are welcome, and if you need anything else, just let me know!"

The family could not get done thanking him, and after he left there was another prayer of gratitude offered. God had sent the Good Samaritan, and the blessing was enjoyed by the giver as well as the recipient. In this case the mother let God do the work. Her extremity was God's opportunity. But we should not wait until we have no one but God left. Let him have the case in charge and you will never fail to find God ready for emergencies.

### THE MILLER IN THE LAMP.

ADALINE HOFF BEERY.

You fragile, fluttering, dusty thing,  
 You are a foolish fellow  
 To bump your nose against the light  
 That burns so fiercely yellow!

Of course you did not understand  
 The brilliant, blinding danger  
 That lured you from the lonesome dark.  
 You poor, swift-smitten stranger!

And yet how heedless men will rush,  
 In spite of sense and reason,  
 Into the glare of place and power,—  
 To homely truth play treason.

Too late they learn the world's fine gilt  
 Is but a furnace cruel,  
 Where demons keep the temper up  
 With human souls for fuel.

Huntingdon, Pa.

THE value of talent, like the value of coin, depends not upon its brilliance, but upon the use that can be made of it.

## CREAM OF MAGAZINES

### PLANTATION LIFE FOR THE SLAVE.

When I was a boy I lived in Virginia in the midst of slavery. It is not my purpose to moralize or philosophize concerning it. Let others discuss its origin, its abuses, its justification, and all that. The sole object of this is to give a generation which knows little about it,

"Nigger Ned," One of the Few Slaves Who Fared Well.

a glimpse of it as it was. Nor must I be counted as an advocate of slavery by reason of anything I say, yet I shall always maintain that if ever a humane system of slavery existed, it was that to be found in the northern tier of Southern States. I do not mean by this that there were not abuses connected with it, notwithstanding its generally humane aspects, sufficient to condemn it as a whole, but as I recall the condition of the slaves in Virginia from 1855 to 1865, and compare it with that of

the other laboring classes I have known, I do not hesitate to assert that I have never known a laboring class which, as a whole, was happier or more content, or between which and its employers such cordial and affectionate relations existed, or which was, in fact, better provided with the ordinary physical comforts of life pertaining to a laboring class, or upon which the yoke of labor set more lightly.

My childhood was passed in several of the most populous slave-owning sections of the State, and I enjoyed unusual opportunities of observation. I knew the owners of the slaves for miles around and was personally acquainted with hundreds—nay, thousands—of the slaves themselves. My earliest residence was on the eastern shore peninsula in Virginia. There were large slave-owners in that section, and yet, under the influence of General Washington's example—for his memory was idolized among those people—a great many slaves had been manumitted by will and many had remained in the community as freemen. So I knew how the free negroes were regarded. They were not feared or disliked or discriminated against in such a way that they had not a fair chance of living. Many of them had homes, and reared their families on land owned by themselves. Many of the whites were opposed to slavery, not slaveowners themselves, and glad to employ them. The free blacks found employment as mechanics or as laborers without the slightest difficulty, and certainly had such opportunities to better themselves that their condition as free negroes ought not to have brought reproach upon them in any comparison between them and the slaves, if they had used their opportunities to their best advantage. Yet it was a notorious fact that the average free negro in that section was neither so well fed, nor so well drest, nor so well cared for in health and sickness as the slaves. In fact, the home of a free negro might be distinguished almost anywhere by the lack of thrift about it. This arose from the fact that the free negro was notoriously improvident; that his own appearance, and the appearance of his stock, and even that of his dogs, bespoke a happy-go-lucky disregard of thrift that was unmistakable. Our old gardener, "Uncle" George Douglas, who had been inherited from my father's grandmother and named after her father, Col. George Douglas, and who, altho a slave, was a wit, a philosopher, a gentleman, and a much-feared and much-respected member of our establishment, had an expression for those who showed lack of family pride or attachment; of such he would say: "He eant no better than a free nigger's dog. He'll follow anybody that feeds him."

On the other hand, as a class the slaves in a vast majority of homes about us were tenderly regarded by their masters and heartily reciprocated the feeling. The household servants, of whom there was a swarm, dwelt in or about the mansion and were integral parts of the family. In many instances the homes or "quarters" of the whole working force of the plantation were grouped

about the mansion-house. There was not much domestic traffic in slaves. The great majority of the slaves had been born of parents owned by the family of their masters, bore the family names, and had grown up with the family. The supply corresponded, as a rule, with the demand of the owner for labor, and there was no occasion for sales. Where slaves of different owners intermarried, it was quite common to accommodate the matter by the owner of one or the other buying or hiring the husband or the wife, in order to allow the two to live together.

The number of household retainers about a slaveholder's home would be astonishing to our labor-saving people. There was a cook with at least one half-grown assistant; two or more house girls, a milkmaid and understudy, a dining-room servant and assistant, a seamstress, a nurse and assistant laundress, hen-huzzy, a caretaker for the negro children, a carriage-driver, as he was called, and his assistant, a gardener, and one or more fair mechanics.

The relations existing between these people and their owners were not sullen and dogged and antagonistic. On the contrary, they were intimate, affectionate, and confidential. The master spent much of his time in the garden or at the stables or in the fields with his laborers. The intercourse between him and his trusted slaves was most free and confidential on subjects pertaining to the work, in which both were deeply interested, and were intelligent, sympathetic, and frequent, and the slaves were stimulated not by cruelty or threats, but by a desire to promote his interests and by ambition for his success. It was a real ambition to merit his approval, even if its results were not to their advantage. So, too, the mistress, from the moment of awakening until nightfall, was busy with and interested in the things about which her female slaves were employed. In the nursery, the black "mammy" of her children, as her head nurse was called, was her best friend and most constant companion. The young girls, reared under her hand as assistant nurses, housemaids, and laundresses, made her the model of their work and of neatness, and were more ambitious of her approval than fearful of her reproof. There was much in common between her and her cook. Care of the fowls, the butter, the cream, and all the varied occupations of a farmhouse brought her in constant contact and affectionate relations with her dairymaids and her hen-huzzy, and their intercourse was that of a friendly and a common interest, much greater than that with hired servants, who are here today and there tomorrow.

In the spring and autumn, when the clothing of the slaves was to be provided, there were very happy and very busy sewing-bees participated in by all the capable females on the place, presided over by the mistress. Usually the nursery was converted into a tailor-shop with cutting-table, shears, and all the necessary equipment. Great bolts of cloth, lining, etc., were on hand. The measurement of the men and women for their suits was always the occasion of great merriment, and the products of their labor were not at all discreditable. The slaves, both male and female, were well clad in summer and in winter. Some of the female costumes were not only neat, but most becoming.

On such occasions there was not only freedom of conversation, but real merriment and enjoyment. It is not true that cruel or unusual work was demanded of the laborers, as a rule. Work was not begun unusually early or continued until an unusually late hour, except in harvest season, and then it was joyously rendered, for it was the occasion of general enjoyment. There was the keenest sort of emulation among the harvesters. I never

witnessed more willing or better work than when ten or twenty stalwart slave reapers went singing through ripe fields of wheat with their scythes. The contests to establish the claim of "best man" were truly inspiring. Nor were they stimulated by threats. They were the offspring of the desire of these men, just as if they were freemen, to display their superior strength and skill. The spirit of emulation was not stifled by slavery. There were good long rests at midday, when feasts were taken out to the harvesters by the cooks and young women. Great jugs of buttermilk and "switchel" were supplied them for their refreshment. The latter compound is a palatable mixture of molasses, vinegar, and water, most refreshing and healthful for toilers in the heat, and even to this day I love it, doubtless from the memories of early associations which it excites.—The Circle.

### STEEL WALLS ARE CUT THRU.

What would you say if you should awake some morning to find your new steel safe, guaranteed to be proof against all the devices of burglars, despoiled of its valuable contents by means of a square hole which had been sawed into it? By means of a method now used in France this is now possible, and a block of steel, neatly sawed on all sides could be taken out and slipped back into place. It is no new thing to hear of iron or steel being cut by the application of heat, and the electric arc and blowpipe methods have been in use for a long time. But just recently a new oxy-acetylene blowpipe has come into use that outstrips all other devices in its accomplishments.

The ordinary oxy-acetylene blowpipe has but two tubes, one for compressed oxygen to flow through, the other for the acetylene. The new device adds a third tube, for more oxygen. When the blowpipe is in position, the acetylene is first allowed to flow out and is ignited; then the oxygen stop-cock is opened and the flame heats the metal to be cut to a bright red. When the temperature is high enough, the stop-cock of the other oxygen chamber is turned on and a thin violent stream of oxygen plays on the metal where the cut is to be made. Under the action of the additional oxygen the metal burns brightly, throwing off showers of sparks formed of magnetic oxide. The jet is moved along the surface and the combustion continues, making a clean cut so narrow that a knife-blade can scarcely be thrust into it.

This work can be accomplished with a great deal of rapidity as compared with the other methods in vogue. A half-inch plate is cut at the rate of a yard in four minutes, an inch plate in six minutes and one of four inches in from eight to ten minutes. At Paris 200 iron girders about seven inches thick were cut in less than five minutes whereas by ordinary methods it would have required half a day's work.

An experiment made on a specially protected safe showed that in 20 minutes the oxy-acetylene blow-pipe opened it, although the walls were three layers of steel, each a half inch thick, separated by copper plates a sixth of an inch thick.—Pathfinder.

### HOME MADE BAKING POWDER.

Buy the best cream of tartar; use four tablespoonfuls of cream of tartar, two of soda, and one of flour; sift them together seven or eight times. There! You have the very best! Make up a lot and seal, or make it as you use it, as you choose.

# Echoes from Everywhere

## GENERAL.

### Babies not Wanted.

White babies and negroes are placed in the same list these days by hotels, landlords of tenement houses and by a few other people. The hotels of Chicago are waging a crusade against babies as guests. Some hotels will not harbor them at all, while the tenement landlords cut out babies, cats, dogs and negroes from their houses. It looks like the present status regarding babies is to be made a permanent fixture in society and that babies are not to be welcome any more by their big brothers who are grown up.

### The Nine-Hour Day for Telegraph Operators.

In times past the telegraph companies of this country have squeezed all the time out of their telegraph operators that they could. The loss of health, the inability to dispatch accurately because of loss of sleep, and the general complaint of the operators had no influence with the telegraph companies. Recently the law of the land struck a nine-hour day for all operators. Anybody who cares to know, knows that nine hours spent in receiving and transmitting rush messages is as much as human nerves can stand.

As a result of the recent decree the Santa Fe road must employ 500 more operators. In other words the old employés were doing just that much too much work.

### Harriman Must Tell.

One year ago, during the investigation of affairs affecting the Chicago and Alton, the Illinois Central, the Union and Southern Pacific railroad companies, Mr. Harriman refused to answer the court's queries concerning his financial relation to these various concerns. Mr. Harriman had bought stock in various roads and transferred it to the Union Pacific road at certain figures. Whether a railroad president could buy foreign stock and unload it on his own company at his will at prices which netted kingly sums to his own wallet was the question. The Court has decided that Harriman shall make public his deals. Another stench may be forthcoming for the public.

### A New Occupation for Women.

It is delightful to learn from the journals devoted to the awakening of womanliness in woman, of the new lines of usefulness they are undertaking. Recently we read of an enterprising Mrs. Barrett, in Texas. She is the superintendent of a school for defectives in Texas. She had an ambition to own a homestead farm and an ideal home. She says, speaking of it: "I will prove to you that the old saw, 'When a woman will, she will, and you may depend upon it, and when she won't, she won't, and that's the end on it,' was true in my case."

She says she found her Garden of Eden, but lacked building material. She read up on concrete, obtained

materials at the least possible expense, and with the aid of some common labor, she proceeded to construct what she wanted, and then to teach others to do so. She is constructing concrete houses, barns, cow sheds, hog pens and fences of concrete blocks, made either with the "Ideal machine," or the cheaper method of the "slush" system.

Intelligent American women are nerve-worn and weary of the noncreative woman's work that's never done, yet is ever to be continued. Without labor-saving machinery, the applied form of organic unity to put housekeeping and home-making under the direction of enthusiastic experts, what is commonly called woman's work must become increasingly hateful to womankind. The old-time methods do not fit in with the new-time demands. Women do well to break away from them altogether, and to take up altogether new creative occupations.

When necessity has created a sufficiently large demand for genuine scientists of cooperative home-making they will appear, and domestic service will be scientifically reorganized. It will then be supplied with every essential for making it one of the most exalted and highly esteemed callings, of both men and women. The home is the heart of all social life, and in it should be found both love and wisdom serving humanity with both science and art at command, and the world at large adoring. Let the world of womankind make a grand break for recreation and try their talents, so long latent, at every new, practical, useful thing.

### Governor Hughes on the War Path.

Governor Hughes believes in integrity if his cleaning-up process in New York indicates anything. The insurance companies of his state seem to carry a high hand in the state legislature, so much so that it is difficult to secure any legislation against them.

Several months ago Mr. Hughes asked for the dismissal of a certain state official who handled the insurance companies of the state, but the legislature refused to remove Mr. Kelsey. The Governor has now demanded the official to be removed and proposes to carry his intention into quick execution. The country needs more straightforward state executives like Governor Hughes, and more fearless presidents like Theodore Roosevelt.

### Road Asks Mediation in Dispute with Employés.

It is probable that Chairman Knapp of the interstate commerce commission and Commissioner of Labor Neill will mediate between the employés and officials of the Southern Railway in respect to wages.

President Finley has sent a letter to Chairman Knapp of the interstate commerce commission indicating that a controversy had arisen between the Southern Railway and its engineers, firemen, conductors, trainmen, operators, and roadway men concerning wages, and requested the exercise of the kindly offices of the chairman of the

interstate commerce commission and the commissioner of labor by mediation and conciliation to bring about an amicable adjustment.

The mediators named in the Erdman act will proceed entirely informally. They will discuss the situation with committees of the employes and with representatives of the railway and will endeavor to bring them to a common understanding.

#### Black Hand Victims.

Last week secret service men in Pittsburg discovered a widespread organization of anarchists and socialists among the Italians of this country, whose object is to terrorize and slay the leading church workers in the Catholic church. Priest Hienricks, who was slain while at mass in Denver, two weeks ago, was a victim of this organization. Several arrests have been made and it is thot that the present plots to murder are all foiled and the organization broken up. The aim of the organization was entirely against Catholic officials.

#### Miraculous Healing.

Attributing her healing to constant and sincere prayer, Miss Lucy Mackey, of Washington, D. C., who for twenty years has been confined to her bed, her right arm and right leg paralyzed, is today able to walk about the room, apparently well. Heretofore she was compelled to lie on her back perfectly helpless. In regard to her restoration to health, Miss Mackey said:

"I attribute my healing to prayer alone. I have prayed constantly for the last twenty years, and I have always felt that God would in his own way help me. This morning, while lying in bed and praying to God, all at once something seemed to pass through my body like an electric shock. From that moment I felt stronger. I knew that strength to my arm and leg had been restored. I immediately leaped out of bed, but while my arm and leg had been made whole, I could scarcely stand for dizziness. Now, I will get out and tell the people what the Lord has done for me."

#### Where Millions of Dollars Go.

American society women seem to be crazy to marry a foreigner who has a court title. The dignity and worth of the office and the character of the man seem to cut no figure. Recently the Vanderbilts gave \$7,000,000 to get an Austrian Count to marry one of their daughters. The Count got \$7,000,000 cash and will heir more from the estate. Last week Mrs. Walker, of Philadelphia, who is worth \$60,000,000, married a foreigner. It is said the United States has recently lost \$900,000,000 by such marriages.

But not only do millionaires have money figure in their marriages, for even some country people's love is quickened by money.

For the first time in our natural history the gold in our country exceeds \$1,000,000,000 according to a report from Washington.

#### Temperance Movements in the South.

The great State of Mississippi has fallen into line, and one more Southern State is added to the three which adopted state-wide prohibition last year. The State of North Carolina has already passed another vote unanimously in both houses of the legislature to submit their constitutional amendment. The question is a live issue in the State of Florida, and without doubt state-wide pro-

hibition is imminent in Kentucky, Tennessee and Arkansas. Texas will have a constitutional amendment campaign next year, and will then be added to the galaxy of southern prohibition states.

Judge William H. Wallace of the criminal court of Kansas City, Mo., last week announced his candidacy for the Democratic nomination for Governor on a straight, law enforcement, Prohibition platform. In his announcement he makes this remarkable statement: "Every murder case tried since I have occupied the criminal bench has been traceable to intoxicants, and more than 75 per cent of other crimes have been due to the same cause. This has put me inexorably against the open saloon."

If Congress has power to prescribe regulations for the shipment of explosives, as it has done, then it has power to prescribe conditions for the interstate shipments of liquors.

#### China Changing Fronts.

Riots and attacks against, or even abuse of, foreigners have ceased. The jingoes have learned a better way. The Chinese are using milder and much more effective methods. For instance, many of the popular songs that are being sung so widely in the schools are saturated with fire-eating and antiforeign sentiment. Many of the textbooks used in the schools introduce the same sort of thing. The native newspapers report many adverse things concerning that "undersirable citizen," the foreigner, and in so doing they take little care to distinguish whether the given foreigner is a missionary or an adventurer, or whether Roman Catholic or Protestant. Be this confusion of thought studied or not, the tendency is the same, i.e., to create an insidious dislike to foreigners as a class. This is apparent, too, on the surface. A customs officer, a foreigner, remarked recently that while a year or two ago the officials would visit him in free and friendly fashion, now they confine their attentions to the barest official formalities.

#### Failure to Make Portugal a Republic.

It has been discovered that the murder of King Carlos, of Spain, a month ago was only one step in the larger plot to overturn the existing monarchy and establish a republic. The present authorities do not intend to prosecute their investigation any further because it would only reveal more treason among the officials and inflame the smouldering passions of the revolutionists.

On the night before the murder it had been arranged for the army to declare in favor of a republic at a certain signal from the land forces. Some one turned traitor to the plot, informed the authorities, and those officials who were depended upon to lead the revolution were supplanted in the army and navy by other officials, who were loyal to the monarchy. A few signals at various places were given but the communications were not transmitted and the whole plot failed. After the revolution republic was declared in Lisbon and the King killed, the army in the north of Portugal was to join the revolutionists and complete the task within two days' time. The murder of the King was the only part of the plot that carried. Monarchies seem to be doomed to extinction.

#### Progress of the Great Reform in Europe.

The fight of the liquor traffic in Europe against the rapidly rising storm of popular indignation is already filling the press of France, Switzerland, and other countries with news, subsidized articles and advertising, similar to that which is found in the American secular press

at the present time. In France *Le Matin*, a powerful daily of Paris, finding recently that the liquor sellers were boycotting its sales on account of its energetic campaign against absinthe, was intimidated by the storm of protest and the editors quickly proclaimed their good feelings toward the "trade" in general and stopped their trade. M. Lalauver, in the *Reform Economique*, sarcastically calls it "a conflict happily ended." In Switzerland, the liquor journals, aroused by the progress of the temperance and prohibition reform, are using a sort of abuse of its opponents that one finds in the "trade" press of America. The dealers' federation loudly calls for members and funds for the coming difficult fight.

The Anti-Alcoholic Exposition held at Zurich in January was well attended. On some days there were more than two thousand visitors, and many of these such as would not be reached by the usual conferences and periodicals. Another exposition is announced for May at St. Gall. The annual meeting of the French National League against Alcoholism was held in December at Rennes. M. Schmidt, deputy for Saint Die, spoke on the Prohibition of absinthe.

Italian temperance leaders united in a great rally at Milan recently at which a federation of the various societies was formed, and a notable impulse was given towards the progress of the reform in that country.

The next international congress against alcoholism will be held in London, the week beginning July 18, 1909. The Honorary President of the Committee of Organization is the Duke of Connaught; the active President is Dean Leigh, president of the National Temperance League.

News comes that during 1907 the Swedish Society of Total Abstinents passed the ten thousand mark. In Norway, Norwege is pursuing its anti-alcohol campaign with the result that in the latter part of 1907, many Samlags were voted out. The Minister of Agriculture, Aarstedt, in a public address on Prohibition, considered it possible in the not distant future.

#### 170 Children Burned to Death.

Cleveland, Ohio, March 5, 1908.—Thirty minutes after school began yesterday the Collins road school building broke out in flames. 170 of the children and one teacher lost their lives. One of the entrance doors was locked which caused the awful loss of life.

#### Local Option for Ohio.

Columbus, Ohio, March 2, 1908.—Without a struggle the Ohio Legislature passed the local option bill, best work going both rural and municipal precincts the right to decide soberly by popular vote. The anti-alcohol forces had been gaining ground under the old law, but the new one will still add strength to the temperance forces. A strong temperance vote is sweeping over the entire State.

#### Governor Asks Legislature to Help End Tobacco War.

Frankfort, Ky., Feb. 26.—In a special message to the General Assembly today Governor Wilson sets forth that the worst of Kentucky is in a state of anarchy, and that but one man has been ordered in the tobacco war, and asks an appropriation of \$25,000 to prosecute night riders, and more power for the Attorney General in courts where it is feared that the local authorities "are likely to fail for any cause to be some such offense furnishing." He also requests the reorganization for a uniform local option law, with the county as the governing unit.

#### Anarchists at Work all Over the World.

With King Carlos, of Portugal, dead from an anarchist's bullet, and with Priest Heinrich, of Denver, Colo., as the second victim, comes the news that an unsuccessful attempt was made to kill the Shah of Persia, and the President of Argentine Republic, all before the short month of February closed. Other rulers are discovering and undoing murderous plots continually, many of which never come before the public.

#### Anarchy in Chicago.

Chicago, Ill., March 2, 1908.—A young Jew, from Russia only three months, an ardent socialist and anarchist, called at the home of Chief of Police, George Shippy, at nine o'clock this morning and gained admittance to the house by pretending to have a letter for the chief of police. Mr. Shippy at once saw by the strange actions of the young man that his mission was more than the mere delivery of a letter so he grabbed the anarchist and tried to search him for weapons, but the anarchist was able to stab the chief, shoot his son and driver before the chief of police was able to kill him.

The envelope was found to contain only blank paper and was intended to engage Mr. Shippy's attention until the anarchist could shoot him. The would-be assassin carried a new revolver in his inside overcoat pocket and a new knife in a belt.

In New York City letters were directed to the leading powers of the world declaring that the United States of Russia are to succeed the present Russian Monarchy. Socialism and anarchy seem to be very active just at present in all the civilized world. Six priests of the Catholic church residing in different states received messages also that they had been marked for assassination.

Anarchy seems to be nearing a crisis in this city. Emma Goldman, the queen of anarchists, is said to have defied the police force to prevent her making a speech. Both federal and municipal authorities have united to drive the leading anarchists from the country.

## WANT AND EXCHANGE

I HAVE several good farms for sale or exchange in Southern Missouri; climate mild, winters short, land productive, good schools, good churches, fine for fruit. For information address, F. E. Cochran, West Plains, Mo., R. R. 2.

WANTED.—Some brother with experience to take stock in and manage a bank in a good small town. Address, J. M. Swetsman, Elbing, Kans.

FOR SALE.—11/2 section fine Canada land with good house and barn. 50 acres ready for crop. Will exchange for Allouez-Duane State or land near Chicago.—Willard, 921 So. Spaulding Ave., Chicago.

BERRY HISTORY from 1784 in Switzerland to 1905 in America, at \$1.08 per copy, at Wenger History from Germany in 1717 to 1905 \$1.10 all post paid. Send to Joseph H. Wenger, South English, Iowa.

WANTED.—Brethren having surplus money on hand to buy large tracts of land in the Imperial Valley, to subsidize for the Brethren Colony. I will insure good income on money so invested. Address, W. F. Gilbert, Hialeah, California.

JANITOR.—Good position, good pay. Work year around. Fine position for young man or for man with twenty years for college.—Mount Morris College, Mount Morris, Illinois.

# MANCHESTER COLLEGE

### MAKE YOUR HORSE YOUR FRIEND

If he's a good horse he'll be better. If vicious or has bad habits all can be promptly and permanently cured by my system. Anyone can do it. Postal brings full information free. Write today.

**PROF. J. H. BEERY, Pleasant Hill, Ohio.**

### EVERYBODY LIKES IT

You can get the genuine old-fashioned, pure HOME-MADE

### APPLE BUTTER

We make it a specialty. We have hundreds of well-pleased customers. You run no risks. We guarantee satisfaction and safe delivery. Write NOW.

**C. J. MILLER & CO., Smithville, Ohio.**

### WHITE PLYMOUTH ROCK EGGS

13 for \$1.25; 26 for \$2.00, carefully packed. The White Rocks have no superior as a general purpose fowl, are excellent layers, mature young for market. My fowls are bred right for vitality, size, color, etc.

I AM A GRADUATE IN VETERINARY MEDICINE and make a specialty of poultry diseases, prescribing by mail for thousands of cases every year. Poultry diseases are very much neglected by the average veterinarian, therefore, such information from a specialist is a rare opportunity. For 20 cents (silver) with complete description of the symptoms of the poultry ailment, I will write a special letter, giving the most scientific way of treating the disease described.

**DR. H. H. LEHMAN, Ashland, Ohio.**

**WHIP STEALING STOPPED** with Farver's Locking Whip Socket. Size and appearance like an ordinary socket, yet will securely lock any ordinary sized whip, when desired, by simply pushing it down in the socket. Unlocked with a key (two of which go with each socket). Durably made; lasts for years; easily attached to dash; guaranteed in every respect.

Price, \$1.50, sent prepaid.

**Wm. Farver & Co., Ashland, O.**

### FREE SAMPLE

Send letter or postal for free **SAMPLE HINDOO TOBACCO HABIT CURE**

We cure you of chewing and smoking for 50c., or money back. Guaranteed perfectly harmless. Address Milford Drug Co., Milford, Indiana. We answer all letters.

### ESPERANTO

is rapidly gaining ground as an international language and now has thousands of enthusiastic supporters in almost every nation on both Hemispheres. We have therefore arranged a clubbing proposition with "Amerika Esperantisto" which is the most popular Monthly Magazine devoted to the propagation of the language.

#### Here is Our Offer

The Inglenook one year, ..... \$1.00  
"Amerika Esperantisto" one year  
and paper-bound copy of Esperanto Grammar, ..... 1.50

\$2.50

If you order both, at once, only \$1.25

Elgin, Ill.

## RESULTS COUNT

That is why **ANGEMA** is becoming so popular.

Used as a Salve and as a Liniment.

**ANGEMA** keeps away croup.

**ANGEMA** prevents lung fever.

**ANGEMA** guards against **COLD** in the head or on the breast.

Have you tried it for your children?

Use **ANGEMA** and stop worrying. Your life will be prolonged, your children healthier and all happier.

It relieves **RHEUMATISM, NEURALGIA** and **HEADACHE**.

Be our representative in your community. **ANGEMA** is good. Our proposition to our agents is better. One lady sold 96 tubes in one small town in a month and without much effort at that. People want **ANGEMA** when they see it. Judge for yourself. Send 15-cents for a full-sized 25 cent tube.

Write for particulars **FREE**.

**THE ANGEMA LABORATORY**  
**GARRETT, PA.**

If you **SPRAY THIS SPRING**—and you'd better!—let me tell you about a compressed air sprayer, only \$7.50, which I have found by experience the best for orchard, garden, greenhouse work and whitewashing.

**W. G. NYCE, - St. Peters, Pa.**

### Thirteen Orders With Scarcely Any Effort

"I hereby enclose you an order for 13 of the new Revised Minutes. I have long wished that my members would get the book and become acquainted with what it requires of us. I believe it would be much easier to care for a church whose members are posted on Annual Meeting decisions, so I just took in hand and secured the order with scarcely any effort."—Eld. J. H. Baker, Astoria, Ill.

#### EACH ELDER OR PASTOR

could help his congregation wonderfully along this line with just a little effort. Try it in your congregation as did the above Elder and the results may surprise you.

The new Revised Minutes contain all the revised minutes up to 1898 and the minutes since that date including the late meeting held at Los Angeles, Cal., last May.

The book is durably bound in cloth and contains over 300 pages.

Price prepaid, ..... \$1.00  
Six copies to one address, prepaid, ..... 5.00

## Ropp's New Commercial Calculator and Short Cut Arithmetic

The Standard for Store, Farm, Bank or Factory,

5 1/4 x 2 1/4 in.

Is from beginning to end a greatly improved, enlarged and thoroughly revised publication.

It contains an entirely new system of unique Tables, Short-Cuts and up-to-date Methods.

It is unquestionably the most complete, useful and comprehensive Calculator ever published.

It has more than twice the matter, scope and capacity of Ropp's former editions, of which

**Nearly 1,500,000 Copies have been Sold.**

It is the most convenient and practical Labor-saving work ever used in the business world.

It will make every one independent, sure and self-reliant in all practical calculations.

It will prevent mistakes, relieve the mind, save time and labor, and often loss and trouble.

Its Tables are adapted to all the trades and occupations in the city and country, and

### Show the Answer as Quickly as a Watch Shows the Time.

It also explains and simplifies the principles of Arithmetic, Mechanics and Mensuration.

It will make the study and use of Figures easy and interesting for young and old.

It will enable every progressive mind to become an expert, sure and rapid calculator.

It will prove a boon to all whose education in arithmetic has been limited or neglected.

### 48 Cuts Illustrate the Elements of Mechanics and Mensuration

It defines about 70 points in "Commercial Law" which every man and woman should know.

It is the result of devising, and improving system after system; of spending thousands of dollars in experimenting; of making millions of miscellaneous calculations, and of doing some vigorous thinking during 38 years, by an analytic, practical and persevering mind.

### It is Especially Designed for

Virden, Illinois

## NEFF'S CORNER

Recently I bought two lots in Clovis, expecting to build on them later. In less than two weeks I sold one of them at a profit of a little more than 166 per cent of the payment I had made on it. Nor did I take advantage of a stranger just in and unacquainted with values. I sold to a neighbor, a man who has been in Clovis longer than I have, and has had every opportunity to know what property is worth here. He had just sold his home and he bought my lot because it was nearer what he wanted at the price than anything else he could find. If you would like an investment here, write

5. Israel and Judah from the birth of Solomon to the reign of Ahab.

6. Israel and Judah from Ahab to the Decline of the Two Kingdoms.

7. Israel and Judah from the Decline of the Two Kingdoms to the Assyrian and Babylonian

Captivity. Containing full Scripture references and subject indexes to the whole series.

Regular Price, per set, .....\$7.00

Our Price, per set of 7 volumes, f. o. b., Elgin,.... 3.50

Will send, express prepaid, for 75 cents extra.

## Mr. World and Miss Churchmember

By W. S. Harris.

It is a forcible allegory, somewhat after the style of Pilgrim's Progress, but in no sense an imitation of it. Fathers and mothers, it is the book that you should get for your son and daughter, and at the same time read it yourself. You will be stronger for the church after having read it. It illustrates vividly how Satan lures the church member, step by step, from the pure Gospel,

till finally he is lost forever. Send in your order at once and you will never regret it. Cloth only.

Our Price, Prepaid .....\$ .75

# ALBERTA

## ¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the colonies already there and enjoy some of the material benefits as well as help build up one of the largest and best colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

### MAILED ON TRIAL FREE

We want you to try Pure Herb Tablets

#### TEN DAYS FREE

and prepare your system for the changeable weather of your climate.

## Pure Herb Tablets

Quickly relieve Constipation, Stomach and Kidney Trouble and Rheumatism.

No Alcohol, no Opiates, no Narcotics.

### 3 MONTHS' TREATMENT \$1.00.

If you have a stubborn case of Constipation, Rheumatism, Kidney or Stomach Trouble, or if you feel bad in any way, try Pure Herb Tablets. They are a wonderful treatment for the digestive system. They strike at the root and cause of the disease.

In most people Uric Acid is present in the blood, gradually accumulating as they grow older, and by lodging in various organs of the body, it causes disease. The blood grows old and impure, thus undermining the strongest constitution.

### SEE HOW EASY.

Just send us a mere postal card, mentioning the Inglenook and we will mail three months' treatment of our Pure Herb Tablet treatment. Use them ten days, if perfectly satisfactory send us \$1.00, if not, simply return the balance and you still have your money. We claim this treatment has no equal for above diseases, and take this honorable way to prove it to our patrons. Don't hesitate.

Speed the day by sending now to

**PURE HERB TABLET CO., 433 Main Street, Ashland, Ohio**

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

#### TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

#### DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

#### DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

# **This Is Not an Ordinary Letter**

Mr. E. M. Cobb,  
Elgin, Ill.

My Dear Friend:

One year ago I visited this valley on a very sad occasion—the death of my brother-in-law, Eli M. Wolfe. I cannot but contrast the conditions then and now. Since then I have made this my home, and I have carefully studied the conditions from several angles.

Five inhabited shacks were then in the central part of the valley; recently from an elevated spot I counted more than one hundred buildings. Then, not an acre was plowed; now areas are plowed and are ready for sowing and some of them for the second crop. Then, not a single sage brush was removed from the town site of Macdoel; now, the town is laid off, streets are cleared and graded, a fine church building, which is a credit to any town is standing on one of the principal streets, several good stores are doing a good business, shops are running, and the dwellings are numerous.

The contrast would be even greater had it been possible to obtain building material fast enough for the demand. Now the railroad will be able to bring to the settlers plenty of seasoned lumber, and besides the local sawmills are able to furnish the same. Yes things are different.

The water is soft, cold and very plentiful, and is of the purest type. I think, however, that when the valley is densely populated, wells will be sunk for drinking purposes as disease germs will be imported with the incoming immigrants, and water is the place where these exist or are propagated. The atmosphere is rarefied, clear and bracing, and is positively without oppressive humidity. The precipitation is sufficient for hay, cereals, vegetables and fruit.

The soil is exceedingly productive, as is shown both by the products, and by the numerous analyses of both state and government experts. There are no harmful alkalis to be found, (Carbonates). Only in small areas and in small quantities are found the harmless borates and sulphates. Cool nights and possible light frosts out of season will be eliminated, as they have been in Scott Valley and Shasta Valley when the large areas are exposed to the sun and pulverized, as the surface will then absorb more rays of the sun, and radiate the heat at night. Besides the rising columns of heat from a cultivated area, and the heat from thousands of flues will dispel possible fogs or cold strata of air.

Timber and stone are not only available but practically inexhaustible. The hunting and fishing are the best and the scenery is indescribably beautiful; this region has an interesting historical past, a busy present, and a very promising future.

Very truly yours,

W. S. Campbell, M. D.

## Olive Branch of Peace

Valuable Contribution.

Dear Brother Hays: I have ordered a copy of your book, "The Olive Branch," and have read it with exceeding interest. It is a valuable piece of contribution, not only to the history of the Valley of Virginia, but also to the history of the Brethren Church and other peace loving societies of God's people. Especially is it valuable as a clear and full statement to the world of what the world is coming more and more to recognize as just, reasonable, and desirable—Peace, and the spirit of Christian peace. I pray and believe that by means of this book, "The fruit of righteousness is sown in peace of them that make peace."

Yours fraternally,

John W. Wayland.

University of Virginia, Charlottesville, Va., Oct. 29, 1907.

This book contains 232 pages, has a number of illustrations and is well bound in cloth.

Price prepaid, .....75 cents

## AGENTS WANTED.

We want an active agent in each congregation to push the sale of this valuable book. It should be in the hands of all of our people. If there is not an agent pushing the sale of this book in your congregation, and you could spare some time for this work, write us for terms. Do it now.

BRETHREN PUB. HOUSE,  
Elgin, Illinois.

## PEERLESS WEBSTER SELF-PRONOUNCING DICTIONARY FOR THE VEST POCKET

A Strictly Up-to-date Book for Everyday Use.

Read what it contains: 51,200 Words and Meanings, Key to Pronunciation, Parliamentary Rules, Postal Information, Table of Weights and Measures, Rules of Pronunciation and Punctuation, The National Bankruptcy Law, Legal Holidays.

A most valuable pocket companion. This is a book everybody needs and is sold at a price which gives man, woman and child an opportunity to get one. Size 5½x2½ inches. Bound in Full Leather, Gilt Edges, Indexed, Price ..27 cents. Bound in Flexible Cloth, Red Edges, Indexed, Price..18 cents

BRETHREN PUBLISHING HOUSE, Elgin, Ill.

# RAISIN CITY COLONY

## Procrastination is the Thief of Time

Don't wait a year and then pay \$100 per acre for land that you can buy now at \$40.

Buy you a home in our "RAISIN CITY COLONY" and live happy in the land of SUNSHINE and FLOWERS.

Postoffice is established with A. W. Vaniman Postmaster. The Hotel is now completed and doing a prosperous business. Raisin City Lumber Company has a large stock of Lumber and is doing a flourishing business.

RAISIN CITY is located on the Southern Pacific Railroad, 14 miles from Fresno, a city of 25,000.

### DAIRYING AND STOCK RAISING.

This land is especially adapted to dairying and stock raising as it, is the home of the alfalfa.

### RAISINS, PEACHES AND FIGS.

Fresno County, in which RAISIN CITY is located is the greatest fruit producing county in the world, 80,000 acres in grapes.

### SOIL AND WATER.

The soil is a rich, sandy loam; the land is generally level and ready for the plow; and abundance of good water.

### PRICES AND TERMS.

We are selling the land at from \$25 to \$50 per acre on 4 years time at 6 per cent.

# Possibilities of IDAHO

## Unlimited

Many settlers are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for young and old of small means to get good comfortable homes with a splendid income.

### Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

### Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

### Realize \$1,000.00 Per Acre

#### Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

#### Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

### HOMESEEKERS' ROUND TRIP TICKETS

## Peace Advocates of the Past

EURIPIDES, 480-406 B. C., cries, "Hapless mortals, why do ye get your spears and deal out death to fellow-men? Stay! from such work forbear." . . . "Oh fools all ye who try to win the meed of valor through war, seeking thus to still this mortal coil, for if bloody contests are to decide, strife will never cease!"

From Seneca (4 B. C.-65 A. D.) we have this outburst, "We punish murders and massacres among private persons. What do we respecting wars, and the glorious crime of murdering whole nations?" "The love of conquest is a murderess. Conquerors are scourges not less harmful to humanity than floods and earthquakes."

Josephus writes: "David said, 'I was willing to build God a temple myself, but he prohibited me, because I was polluted with blood and wars.'"

Here are a few testimonials from some of the early church fathers:

Justin Martyr, who died about 165 A. D.: "That the prophecy is fulfilled we have good reason to believe, for we (Christians), who in the past killed one another, do not now fight our enemies."

St. Irenaeus, about 140-202 A. D.: "The Christians have changed their swords and their lances into instruments of peace, and they know not how to fight."

Clement of Alexandria: "The followers of Christ use none of the implements of war."

Tertullian, about 150-230 A. D.: "How shall a Christian go to war, how shall he carry arms in time of peace, when the Lord has forbidden the sword to us? . . . Jesus Christ in disarming St. Peter disarmed all soldiers." (*De Idololatr*, 19.) "The military oath and the baptismal vow are inconsistent with each other, the one being the sign of Christ, the other of the Devil." . . . "Shall it be held lawful to make an occupation of the sword, when the Lord proclaims that he who uses the sword shall perish by the sword?"

Origen, 185-254 A. D., says, "The angels wonder that peace is come through Jesus to earth, for it is a place ridden with wars." "This is called peace where none is at variance, nothing is out of harmony where

there is nothing hostile, nothing barbarian." "For no longer do we (Christians) take arms against any race, or learn to wage war, inasmuch as we have been made sons of peace through Jesus, whom we follow as our leader." (*Patrologia Græca*, XIV., pp. 46, 988, 1231.)

St. Gregory of Nyssa, 335-395 A. D.: "He who promises you profit, if you abstain from the ills of war, bestows on you two gifts—one of the remission from a train of evils attendant on the strife, the other the strife itself." (*Patrologia Græca*, XLIV., p. 1282.)

St. Augustine, 354-430 A. D.: "Not to keep peace is to spurn Christ." (*Migne's Patrologia, Latina XXXIII.*, p. 186.) "Defensive wars are the only just and lawful ones; it is in these alone that the soldier may be allowed to kill, when he cannot otherwise protect his city and his brethren." (*Letter*, 47.)

Isidore of Pelusium, 370-450 A. D.: "I say, although the slaughter of enemies in war may seem legitimate, although the columns to the victors are erected, telling of their illustrious crimes, yet if account be taken of the undeniable and supreme brotherhood of man, not even these are free from evil." (*Patrologia Græca*, LXXVIII., p. 1287.)

We have also the undisputed historical record of Maximilian, the Centurion, who, having embraced Christianity, resigned his position and refused to fight. For this he was put to death.

Celsus, the great opponent of Christianity, who wrote about 176 A. D., reproaches the Christians for refusing to bear arms, and states that in one part of the Roman Army, including one-third of the whole, "Not a Christian could be found."

Martin replied to Julian, the apostate, "I am a Christian, and I cannot fight."

Testimonies from Popes:

St. Gregory the Great, 540-604 A. D., writes the King of the Lombards, "By choosing peace you have shown yourself a lover of God, who is its author."

Here is Carlyle's picture of war: "Thirty stand fronting thirty, each with a gun in his hand. Straightway the word 'fire' is given and they blow the souls out of one another; and in place of sixty brisk, useful craftsmen, the world has sixty dead carcasses which

it must bury and anew shed tears for. Had these men any quarrel? Busy as the devil is, not the smallest! They lived far enough apart, were the entirest strangers; nay, in so wide a universe there was even, unconsciously, by commerce, some mutual helpfulness between them. How then? Simpleton! Their Governors had fallen out, and, instead of shooting one another, had the cunning to make these poor block-heads shoot."

MacMichaels addressed the Peace Congress at Edinburgh, 1853: "The military profession is inconsistent with Christianity. The higher the rank and the greater the intellect, the more desperate the criminality. Here is a person upon whom God has conferred the rare gift of mathematical genius. If properly directed what an abundant source of benefit to mankind. It might be employed in the construction of railways, by which the most distant parts of the world are brought into communication with each other. It might be employed in flashing the trembling lightning across the wires, making them the medium of intercourse, between loving hearts thousands of miles apart; in increasing the wonderful powers of the steam engine, relieving man from his exhausting toils; in application to the printing press, sending light and knowledge to the farthest extremities of the earth. It might be employed in draining marshes, in supplying our towns and cities with water, and in adding to the health and happiness of men. It might lay down rules derived from the starry heavens, by which the mariner is guided through the wild wastes of waters in the darkest night. How noble is science when thus directed, but in the same proportion how debasing does it become when directed to human destruction! It is as if a chemist were to make use of his knowledge not to cure the diseases of which humanity is suffering, but to poison the springs of existence. The scientific soldier cultivates his endowments for what purpose? That he may determine the precise direction at which these batteries may vomit forth their fire so as to destroy most property and most lives; that he may calculate the precise angles and force with which these shells may be sent up into the air that they may fall upon that particular spot which is thronged with men, and exploding there, send havoc among them. Great God! am I at liberty to devote my faculties to this infernal work?"

George Washington said:

"My first wish is to see this plague of mankind, war, banished from the earth."

#### NOTABLE MEETING IN WESTMINSTER ABBEY.

AN important conference was held in Jerusalem Chamber, Westminster Abbey, recently, under the presidency of the Archbishop of Canterbury. This meeting was the direct outcome of "A message to the Na-

tion," distributed thruout Great Britain, signed by Randall Cantuar, Francis, Archbishop of Westminster, and J. Scott Lidgett, President of the National Council of the Evangelical Free Churches, in which was set forth the absolute necessity for one day's rest in seven for the physical and mental efficiency of men, women and children, to make home life more truly what English home life ought to be; and to give all an opportunity in the worship of Almighty God, to escape from the grip of ordinary cares and occupations into regions of higher and nobler aspirations. At this meeting many prominent persons were present, besides representatives of over forty Sunday Observance Societies. The Chairman of the National Council of the Evangelical Free Churches, Rev. T. Scott Lidgett, Thomas Law, Secretary, the Convener of the Free Presbyterian Churches of Scotland; Bishops and Clergy, members of parliament and others, took active part in the meeting. The various claims to Sunday rest were urged, on behalf of shopkeepers, especially by Lord Avebury, who proposed a resolution urging legislation "in accordance with the general wishes of the shopkeeping community." Similar claims were urged on behalf of those engaged in merchant shipping, the police, railway employes, postmen, fishermen, tramway men and other branches of industry in which enforced Sunday labor is now prevalent. A resolution was unanimously carried that a committee be formed representing all such societies and religious bodies as may be willing to coöperate in creating a national Lord's day Alliance, similar in constitution to kindred national organizations already successfully established in various Christian countries of the world. The Honorary President of The Woman's National Sabbath Alliance of America, with her husband, the Honorable Darwin R. James, manager of the American Sabbath Union, were present and contributed in securing this desired organization. The Woman's National Sabbath Alliance has just passed its thirteenth annual meeting, with Mrs. Don O. Shelton, recently elected President. The Alliance shows the vigor of inherent life in its increasing number of auxiliaries, and its widely circulated literature. 500,000 pages of literature have been circulated in the United States and Canada the past year, some of which, printed in Bohemian, Italian, Magyar and Russian, has been given freely to immigrants arriving in New York. A new Auxiliary has just been organized for the City of New York. The coöperation of all Christian people is greatly desired in the work of the Alliance. \$1.00 a year constitutes membership; \$10.00 a sustaining membership.

Samples of literature and the annual report can be obtained at the headquarters of The Alliance, 156 Fifth Avenue, New York.

HAPPINESS is the harvest of helpfulness.

## Return of Jews to Farm Life

WHEN in March, four years ago, the Governor of New Jersey signed the charter creating the borough of Woodbine, it is doubtful if he realized that the thing he did was historic, even epoch-making. That Woodbine was interesting he must have known, for farming settlements of Russian Jews do not plentifully dot

Philadelphia? There are hundreds of thousands of Jews in Russia to come over, there is plenty of money to help them in the way of loans when they come here, and there is an object-lesson for them in the communities now established. Galveston took the matter seriously enough to receive them by its mayor, who

made them a very cordial and hearty speech of welcome. To argue on such a subject is useless. It is, on the other hand, very important to set forth the facts and let them speak for themselves.

To sum up the present situation, there are now five Jewish settlements in southern New Jersey, one of them the town of Woodbine, entirely self-governed. There are settlements of Jewish farmers in

Massachusetts and Connecticut assuming very respectable proportions, as indeed they are throughout New England. The Dakotas have a goodly number of Jewish farmers (in one spot the third generation is now farming), and they are increasing in Michigan and Illinois. In Arpin, Wis., a colony has been organized on the lines of Woodbine, embodying its principles and profiting by its experience. For that matter, you may find Jews truck-farming in Florida and raising cotton in Oklahoma. In all, they cover twenty-three States and Territories.

the landscape anywhere; but Woodbine is more than merely uncommon. The Governor who signed that charter was giving Jews their first chance at civic self-government since Titus, more than eighteen centuries ago, left not one stone upon another in the Holy City and the long tragedy of Jewish exile began.

The late Baron de Hirsch, great financier and great philanthropist, left his millions to help Jews because, he said, they were the people who most, in all the world, needed help. His enormous legacy was to be expended in different ways, but most deeply in his heart was the ideal of "back to the land." The money to finance the establishment of many of the Jewish farming communities came from this land. Perhaps the most conspicuous effort was made in the Argentine Republic, but this country has also profited largely by his generosity. In fact, the policy of helping the Jew back to the land and settling him in places other than large cities has been successful enough to call forth recently the gift of sums amounting, it is said, to over \$1,000,000 for an extension of this work in a way that should profoundly affect the Jew in this country and that may be of national importance to the United States. In reply to the ever-recurring demand for restricted immigration, a great organized effort, headed in Europe by the Rothschilds and in America by Jacob H. Schiff, is being made to turn the tide of Russian emigration from the congested ports of the North to the young lands of the West and South. Is America likely to find, in ten or twenty years from now, little towns of self-governing Jews throughout the great West as a result of the new scheme of landing Russian Jews in Galveston, Tex., instead of New York or Boston or

Woodbine, N. J., the Only Jewish Municipality Known in the World Since the Roman General Titus Destroyed Jerusalem in 70 A. D.

Jewish School Children of Woodbine, Who Are Taught Both Mosaic and Modern Doctrines.

Woodbine was founded in 1891 by the trustees of the Baron de Hirsch Fund in connection with a committee of immigrants. Several little Jewish communities were already prospering in southern New Jersey, or they were at least holding their own, so these seventy-five Russian immigrants were minded to follow

suit. They had 5,300 acres of land covered with scrub-oak and stunted pine and a great deal of patient endurance. They had also a good superintendent, Prof. H. L. Sabsovich, whose insight into men and things and whose unfailing enthusiasm were to help them in many a hard place. Thus equipped, they started in.

The settlers had many disappointments. The fact that the soil required so much fertilizing and that there were so few local markets was against their immediate success. They had, too, an idea that is thoroughly characteristic of the *ghetto* Jew who has through all the ages preserved a passionate attachment to his ancient home. The Woodbine settlers, in the joy of their return to the land, wanted to be as were their forefathers, and the crop which most attracted them was that of Palestine—the grape. The soil of southern New Jersey did not respond properly to this poetic and pathetic impulse, so the pioneers to a great extent gave it up and turned to the commonplace sweet potato and made a success of that.

Nowadays things are vastly improved agriculturally. The establishment of factory industries created, at the very door of the farmers, a considerable demand for their produce. They arranged to sell their fruit and vegetables at seashore resorts. They learned experience by their failures—above all, they profited by the establishment of an agricultural school.

Of the \$25,382.38 actually raised by taxation during the years 1904, 1905, and 1906, a little over one-half was spent for the public schools. Only \$150 was appropriated for the poor, and this was not half expended, and what was spent went not to Woodbiners, but mostly to destitute non-Jews who “happened along” after the fashion of tramps. There has been but one arrest in Woodbine, a “drunk and disorderly” Gentile from the neighborhood.

We gather the above from the *Circle*.

With all the inducements given the Jew to found colonies in this country it is likely that he will continue to be a wanderer until his national destiny is settled, because there is an inborn desire in every orthodox Jew to occupy his old ancestral home in Palestine. Small squads of them will colonize and amalgamate with modern people, but the racial instinct of the Jew is very much alive and he will not make a permanent national home until his title to Palestine is restored. When that time comes we may expect them to become agriculturists, statesmen, educators and commercialists with an enthusiasm and success which the world has never witnessed. Their long pent up genius, energy and close coöperative qualities will set a pace for the world which even the Teuton has never attained. Also their religious integrity will manifest itself in standards and fruits of holiness which the Gentile never attained. The seed for all this wonderful success has been planted, and

has been growing for nearly nineteen centuries and when the flower and fruit of this mysterious plant mature to the world it will mark a new epoch in the world's history.

#### PROF. MUNSTERBERG ON MALICIOUS ANIMAL MAGNETISM.

While every one can excite hypnotic influence, no one can do it by a mere glance. All the stories of a secret influence by which one man's will gets hold of another man's mind are remains of the mesmeric theories of the past. Today we know that everything depends upon the attention and imagination of the hypnotized, and that no mysterious fluid can flow over from the mind of the hypnotist to the mind of the subject. The old mystical view of unscientific superstition reached its climax in the prevalent belief that a man could exert influence from a distance, without the victim's knowledge of the source of the uncanny distortion of his mind. In “Science and Health,” Mrs. Eddy wrote: “In coming years the person or mind that hates his neighbor will have no need to traverse his fields to destroy his flocks and herds . . . for the evil mind will do this through mesmerism, and not in *propria personae* be seen committing the deed.” And again: “Mesmerism is practiced both with and without manipulation; but the evil deed without a sign is also done by the manipulator and mental practitioner. The secret mental assassin stalks abroad, and needs to be branded to be known in what he is doing.” Or, “that malicious animal power seeks to kill his fellow mortals, morally and physically, and then to charge the innocent with his crimes.” There ought to be no compromise. The morally ruinous doctrine of “malicious animal magnetism” is a complete distortion of the facts; nothing of that kind is ever possible. Some think that if the surprising facts of hypnotism are possible, such telepathic mesmerism might be possible, too, since the influence looks similar. We might just as well declare that if it is the surprising fact that a hen can be hatched from a hen's egg, it may also be true that a hen can come from a white candy egg, since they look alike. It is exactly the essentials of hypnotism and telepathy which are dissimilar and not to be compared; the latter would be a mystery; the former is no harder to explain than any act of sense impression and attention.

#### TIME FLIES AWAY.

MARTHA SHEPARD LIPPINCOTT.

Time flies away on lightning wings,  
We know not where it goes;  
But somewhere in the dim, far past,  
Just where, one hardly knows.  
We bid it tarry just awhile,  
Till we have time to do  
The things we wish to do each day;  
But it must hurry, too,

And get around before the sun  
Says it must go to bed;  
For somehow Time, like other folks,  
Must be a sleepy-head,  
And has to have its night-time, too,  
When sunshine disappears.  
It cannot longer stay today  
When night summons, it hears.

Moorestown, N. J.

## A Peculiar People

John S. Fernald

THERE exists in the state of Maine, a community under municipal conditions which probably has not a parallel anywhere else in the Union. The place is known as Hibbert's Gore, and is located about midway between Augusta, the state capital, and the sea-coast city of Rockland. The Gore contains about 500 acres, and is in no township nor county, tho' bordering on three. A few years ago there were a dozen or more families including more than 50 persons living on the Gore, but the number is now reduced to 13 persons in three families, four of the inhabitants being of school age. The people, being in no township pay no taxes, but keep

in 1827 from portions of Lincoln and Hancock counties, and in 1860 Knox County was taken from Lincoln and Waldo. In running the lines for some of the earlier changes, the surveyors, with the imperfect instruments of that day, followed different courses, and as a result the lines failed to meet and this triangular section was left out, and the people found themselves to be without a county. Attempts have been made in the past to attach the Gore to one or the other adjacent townships, by act of Legislature, but the plan has been opposed by both parties. The people of the Gore do not want to become attached and pay taxes, and the people of the townships fear that the expense of maintaining the road, schooling, paupers, etc., that might arise would more than offset the taxes. As the people most interested seem to be satisfied, other people are not disposed to interfere.

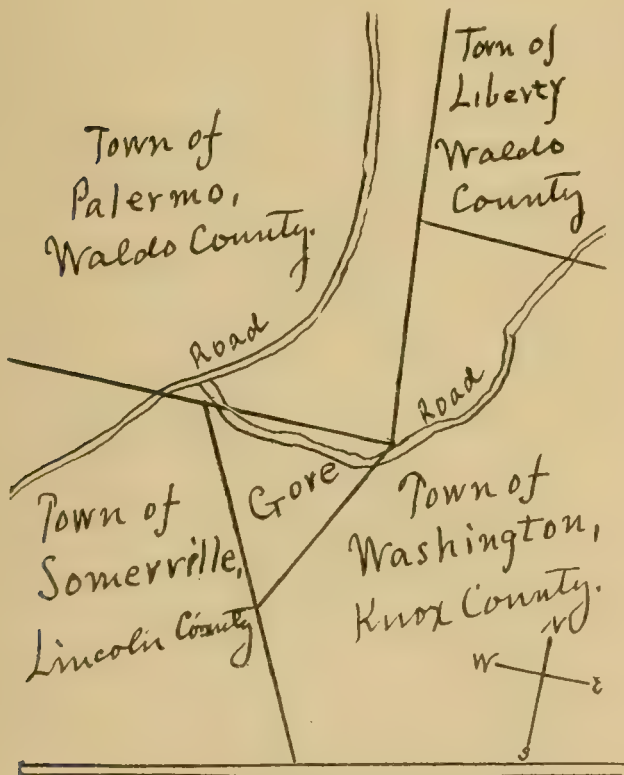

The conditions at the Gore have led to some amusing events in the past. Some time ago a man from outside that because the place was not in any town or county it was not under the state laws, and he prepared to set up a liquor shop there, thinking that the people from all around would drive through the Gore road and get liquid supplies that were hard to procure in the villages thereabouts. But he overlooked the fact that he was in the United States and neglected to pay the internal revenue tax. His first customer was a U. S. deputy marshal, who promptly closed up the business. Another man, living in a neighboring township thought he could get rid of paying taxes on a large herd of cattle by driving them down to a barn which he bought on the Gore, just before the day of assessment, April 1. The assessors taxed him for the cattle, and threatened to make a test case of it in the courts, and the tax dodger surrendered. Lincoln County exercises a protectorate over the Gore to the extent of recording deeds, but otherwise the place is, in a political sense, nowhere.

Belfast, Me.

### HOW TO KILL A GOOD BUSINESS.

In 1880 the United States exported 39,000,000 pounds of butter and 12,000,000 pounds of cheese. Twenty-five years later, in 1905, it exported 16,000,000 pounds of butter and 8,000,000 of cheese. This tremendous decline, notwithstanding the increased demand abroad, was due to the methods of some American exporters who shipped adulterated butter, sold oleomargarine for butter, and used similar methods in the exportation of cheese.—Taken from a Consular Report.

their one short section of road in repair by mutual labor, and pay tuition for their scholars in the schools of the neighboring towns.

The reason for this peculiar condition is because of an error in an ancient survey, in laying out the old plantations, which afterwards became incorporated as townships. Originally the whole section was known as Patricktown Plantation, and was in the county of Lincoln. In 1804 the township of Palermo was formed; in 1811 the township of Putnam, now Washington; and in 1858 all that remained of the original Patricktown was incorporated as Somerville. Waldo County was formed

# The American Braggart

Elmer E. Shank

MODESTY becometh all men. A quality little sought for but admired by all men, is this rein to self-assertion whereby a man's acquaintances are invited to seek his good qualities rather than to have their presence thrust upon them in the possessor's own terms. The general rule of really great men and women seems to be the suppressing or guarding of their real worth, to the passer-by or chance acquaintance. Musicians are usually of this type; great inventors and great writers need to be drawn into society or to the discussion of their own hopes and aspirations. Edison is such a man. Emerson was such a poet.

Valuable is the friendship of these people. Worth seeking after is their friendship or their companionship. Worth the earning is their confidence. There is a reality—something substantial—in their influence that makes us better for having lived with them and having learned to know them. How much better to be able, with one's friend, to take him at par or to expect a premium on him rather than to have to discount him, discount his words, his deeds, his actions or his attitudes.

I wonder, then, where we Americans fall. Into what class do our ex-country cousins cast us? Into what class do we throw ourselves? Can we group with the pure white Swiss or the sturdy Hollander? Can we stand in the light of the Norse or Swedish thorobred? Is our egotism less than that of the self-satisfied Englishman, or our carelessness more apparent than the hapless Irishman? Can our "gude" heart send the pure blood thru our veins to the color of the worthy Scot? Yes, the blood will come to our faces, but rather as we blush in shame than flush in embarrassed modesty.

The brag of Americans is too apparent to conceal. We are by our own admission the most progressive and important nation on the face of the earth. Taken collectively we are the saucy go-ahead greed-mongers of the commercial and political world. Taken individually we are the guffahs and dunces of society. By our white cousins of other nations we are awaited in wonder, met with surprise and then followed with pity and contempt. They politely hold the curtain aside to smile behind it as we pass into the international ball-room to swell out and show our importance—literally to make fools of ourselves. We captivate the ladies and arouse the jealousy of our French or English rivals and we tell them of Bunker Hill, of Stillwater, Ticonderoga and Yorktown, but we don't mention Marquis de Lafayette or the men in England who took our part. We boast of Dewey and his banner fleet that crippled Spain but we forget to thank En-

gland for the English shells he shot at the enemy. We forget Catherine of Russia and the aid she furnished us; we fail to thank Germany for the science or the invention she has taught us. We are the self-styled key to all modern accomplishment, no share of which we ever allow other people rightfully to claim.

Has such braggardism won us friends or made us enemies? I really don't believe that the foreign friend who listens to our story in open-mouthed wonder really loves us and respects us when we are gone. I don't believe he will seek our further acquaintance without great provocation.

The braggart at school overcomes his momentary adversary, but somehow when the fray is over that braggart is left coolly alone by his playmates in general. He is but a tinkling cymbal in a dark, hollow barrel. He is discounted at once and is likely to get worse than he deserves. The statement was once made, "Prove that Mr. — is the greatest orator in Indiana," and the pointed answer came, "You don't need to prove it, he admits it."

Were we not such braggarts we would better endure acquaintance. A good horse is loved more by his owner year by year. A Saint Bernard dog is treasured more highly when the master finds better traits as each day passes by. A true teacher comes to be loved by pupils as they draw deeper from his wisdom and tap the fountain heads of his knowledge. But if we start out at our zenith before our friends, according to our own representation, how shall we endure the subsequent search into character and soul that comes with close association? I have had one Professor as a teacher for whom I think I would willingly give my life if need be. Of all my teachers there was only one such. Every time I came into that teacher's presence I found him better, more capable and profound and always sincere. The strength of a man lies not in his veneer but in the fibre of his being.

Reputation, and often character, are not so much what we think they are but what others think about us. We are inclined to take ourselves too seriously. I was once in an oratorical contest which I intended to win, but I found chance to gain more knowledge when a young lady lowered my colors with a rank high enough to beat me. We are constantly showing our best side to our friends, we are always on dress parade; we never allow friends to catch us working at home with the veneer all gone and our working clothes on. We advertise that we are better than our neighbors and that we deserve more than they.

What, then, shall the verdict be? Associates shall say to one another, I will discount you twenty per

cent; it ought to be thirty; and thus we go. As watered stock, we are at a loss to know just where to fix our present worth. Thus we exist as an artificial group, speculative and uncertain, mistrusted even by our friends. Europe and the yellow men are less lenient with us. If we have not grown up in modesty ourselves, can we not at least teach it to our children? O would that Americans as tourists could stand as an example to their hosts to be copied and remembered! Let us be missionaries of the Christ Spirit that leadeth and upbuildeth not in vanity but in truth.

*Grants Pass, Oregon.*

### FOR THOUGHT AND ACTION.

DALLAS B. KIRK.

ADVANCE!

Mean business.

Who said, "Fail"?

Less talk, more work.

Put your hands to work.

Silence wins its own battles.

Live contented within thy means.

Honest meddlers make dishonest peddlers.

True men are hard to find.

Go and meet opportunity half way.

Plans alone never get very far.

Get busy with something worth while.

Laziness and work parted long ago.

Worry is the minus in life.

Meet every issue with an honest face.

Up, comrades, up! don't sleep all day.

Watching the clock and employer never paid.

Your forgetter may be your best friend.

Some honest hearts beat under dishonest coats.

An honest life may contain some strife.

Work is always busy; laziness always idle.

If your time is paid for, don't loaf.

The demand for fools is never fully supplied.

Don't poison yourself with sulky fits of temper.

Grip your work with the hand of determination.

Be a hero by slaying your evil thoughts.

We will never regret having done our duty.

Work is the keystone in every successful business arch.

Study to become wise, but be careful how you show it.

Have you too many cares? then get rid of laziness.

Some people wear out more clothes loafing than they do working.

The sunny side of life seems to be hard on some people's eyes.

Are you ashamed of work? then work is thrice ashamed of you.

Is your life worth living? then don't trade it off for nothing.

If you run into debt you may have to walk out badly crippled.

Let go of the past, improve the present and pray for a happy future.

Cut your way thru the hill of laziness with the grit of a Roosevelt.

Truth, health and freedom are the three golden links in the chain of happiness.

A happy mind is more than medicine for the body, acting as a tonic.

Grit will help you over the mountain of difficulty and thru the valley of despair.

Don't think everything is going to the dogs, nor throw your sympathy in that direction.

Being on the shady side of fifty does not prevent you from looking over into the sunshine.

Stop, youth! Do you wish your future to reap a harvest of bitter regrets? Then don't sow that wild oats.

Keep on the working side of life while young, and in old age you can say: "I had a 'Square Deal.'"

Working winter, spring, summer and fall,  
Pays better than loafing out it all.

Seek work and you will have money and enjoy pleasure; seek pleasure and you will lose both your cents and sense.

Plow down the weeds of laziness in your brain, sow the seed of usefulness, keep well cultivated, and you will reap an abundant harvest of good things.

*Pentz, Pa.*

### "TOMORROW."

RICHARD BRAUNSTEIN.

Dream—Gilded dawn! Skein that is never spun!  
Cup of a hundred sorrows, drained or spilled!  
What is your mystery? Some earth begun,  
Earth-born has found in you a hope fulfilled  
Time's fateful fingers on that brow shall press  
The seal of patience on the stamp of pain;  
But each "tomorrow" brings a new caress,  
A light of courage to the soul again.  
A whispered, "Hope! nor follow black Despair  
Down to the shadows of its grinning lair!"  
Today we yearn to know that perilous glare  
Of which tomorrow's sun shall make us sure  
So lives the Son of Man, nor counts his sorrow;  
Hope springs eternal in that word "Tomorrow!"

### HOW TO REACH THE INGLENOOK.

A LETTER addressed to the Brethren Publishing House, Elgin, Illinois, without specifying which department, it is intended for may have a sad time before it finds any one in the House willing to claim it, besides losing considerable time, because there are fully a dozen different departments which carry a correspondence independent of the other departments. For this reason we ask that our correspondents place the word INGLENOOK on the envelope. This insures safe and speedy delivery.

## CURRENT COMMENTS

FROM 480 B. C. TO 1901 A. D.

Very little has been said about the change of base in the world's doings which was witnessed by the victory of the Japanese over the Russians—the yellow race over the white race. Such an event had not been recorded for over 2,300 years. From the time that Xerxes set out with 1,200 sail to subdue the wiry Greek and was repulsed at Thermopylae and Salamis in 480 and 479 A. D., until 1901 the European never bowed to the Asiatic. True, in the Crusades, and at other times, the European was repulsed at odd times, but in this last event the yellow man overcame and stands triumphant today, whetting his sword for another challenge with the white man. It is Asia against the world now once more after 2,300 years of playing second fiddle.

Beginning with the Greek rule the Asiatics have been beaten and outwitted, times without number. The only time when Europe did tremble for independence was when the Moors of the eighth century overran Spain, but Charles Martel ended their advance in 732 A. D., and they eventually departed to African shores.

In the conflict between Japan and Russia a new era has dawned. The Japs showed themselves a superior genius thruout the war, and in trade the yellow man has cleared the Asiatic waters around Eastern Asia of foreign trade. Even between Bombay and China the Japanese marine has captured the trade.

The little hornetlike Jap is felt in international politics today; he is in too much evidence in both Canada and the United States; he has absorbed Korea, dominates Manchuria, and is molding the mind of China. What Japan is Asia will be. Whether Asia shall ever rule the world again as she did for many centuries remains to be seen, but at least the 2,300 years of European,—the white man's—monopoly is drawing to a close. We hope to see no one people, nation, or clan rule the world. Let freedom and liberty, and national righteousness prevail among all colors.

### MORE WAR TALK.

Congressman Richmond Pearson Hobson bids us note Japan's naval expansion. To quote his words:

"The white race and the yellow race will clash, and the first war will be between the United States and Japan. This will be followed by a general war between the white and yellow races, unless by the building up of a great navy this country shows Japan the foolishness of engaging in a war with the United States.

"Japan has ordered \$125,000,000 worth of great war-ships since her war with Russia. Japan does not need these ships against Russia, China, or Great Britain. Japan has added five divisions to her army since her war with Russia, and the military activities of Japan have more than doubled since that trouble came to a close. The United States has furnished them 750,000 rifles. Japan can put 200,000 soldiers aboard ships inside of four days.

"The Japanese could land 400,000 soldiers on the Pacific slope in four months, another 400,000 in six months more, and a million men in a year. They could put ten soldiers to our one on the Pacific slope. Japan will have

eight new battle-ships ready for service soon, any one of them equal in effectiveness to three of ours. If they get the Pacific Ocean they will take the Pacific slope.

"The Japanese have educated their people to hate Americans, and the people are only awaiting the Government's signal to go to war—the Government is awaiting only a pretext."

The above is a fair sample of a great amount of public talk heard in various parts of our country. Reports say that the masses of the Japanese people share largely in the sentiment indicated above. If enough of such talking is done it is possible to precipitate a useless war between the two nations at an early date, altho Ambassador Takahira, from Japan, who has just assumed his official duties in Washington, delivered a message of peace and good will to President Roosevelt from the Emperor of Japan. The Emperor asserts that it is foolishness to talk about breaking the friendly ties that have existed between the two nations for so long. The Emperor's sincerity cannot be doubted and if he has his way, and the newspapers do not succeed in firing the minds of the people, there is no danger of war for a long time to come.

The expansion of Japan's army and navy is not out of proportion to her territorial and commercial expansion so that the cry of preparing for a definite attack could just as well be made against the United States and all the European nations, for which one is free from this charge? Germany is more than doubling her fleet by ordering more and bigger war-ships. What enemy is she preparing to attack? None. It is only the carrying out of a peaceable national policy. And so it is with Japan. She has adopted the modern notion that commercial and industrial expansion must be accompanied by a proportionate increase in war equipment.

The present danger lies in the fact that the large per cent of illiterate Japanese believe current rumors and are easily stirred to the fighting point, and the government of Japan is more responsive to the clamor of the people than most governments. The Emperor could be drawn into a conflict unwillingly if the people at large should demand a defense to their national honor.

Peace advocates should become active in talking peace and distributing literature which teaches peace. The cry of war is going forth, and the stampede may come, but let us work to offset the present erroneous course of affairs.

### TRAVAIL WITHIN THE CATHOLIC CHURCH.

Many prophets of our day have been terrorized in late years with the prevailing liberalism in religion, philosophy and science, but it was left for the Pope to make the most dramatic dash toward offsetting what is now generally called "modernism." With a fearlessness and a sweep that startled the thinking world he threw his entire force into the onward march of this enemy of the church and society as well.

Whether, or not, he can rally enough energy to offset all that he calls evil remains to be seen, but he has manifested a conviction and an independence which are commendable.

Several of his own communicants, both lay and official, have answered his encyclical arguments and protests but the Pope shows his determination to impose his ecclesiastical prerogative upon his subjects by later and repeated statements. We believe that the saner element in humanity would have settled back upon the old fundamentals of religion at an early date whether the Pope had issued his

manifesto or not, just the same as they did in the sixteenth century. It is well known that when Luther first demonstrated the weakness of popes by asserting individual liberty before God, many Christians were swept too far along by the joy of answering directly to God instead of worshipping thru a priest or pope. The Catholics made much capital out of the moral laxity of Luther's followers and Luther lamented that his disciples who had been restricted so long now took too much liberty. In the course of a few years, however, conscience settled people upon a moral plane higher than they had known before.

In the present flurry, caused by some unfounded and premature claims of scientists and higher critics, many people have lost their moorings and are adrift, and many will be swept into the irreligious tide of the day, but the race has never yet wandered away from God's righteous ways but what they swung back nearer to the kingdom of truth than ever before, altho numbers do not always indicate this, but a clearer vision is had just the same. As long as higher critics dispute and wrangle among themselves about their own criticisms of the Bible the saint need not worry about the foundation of his hope. And as long as scientists of one decade disprove and throw away the hypotheses of their predecessors, again, we need not fear modernism nor any other ism whether the Pope issues his veto or not. "Nevertheless the foundations of God standeth sure," and "thy word, O Lord, is forever settled in heaven," are verified truths that neither science nor philosophy can make or unmake.

#### GRAFT IN BUSINESS VS. GRAFT IN POLITICS.

When Rudolph Spreckels saw his San Francisco gas stock drop from 85 to 60, he came to . . . town to attend to his duties as a stockholder and—to learn what graft is in business; and what politics is in business; and what the relation of said business corruption is to political corruption. Rudolph Spreckels made some swift, superficial inquiries about the gas company, and he heard that it had a big floating debt. There were other signs of neglect in the management, yes, and of inefficiency. The directors were all "leading citizens," "prominent business men," "veterans in finance." They were just the sort of men that business men would put upon a board of aldermen or supervisors to give good business government. Yet this young man found that these picked business directors were neglecting their duty to him as a stockholder, very much as his supervisors neglected their duty to him as a citizen and property holder.

And that wasn't all: the company wasn't earning the dividends it was paying to him! Why? The price of gas was high enough; gas companies elsewhere earned big dividends at a much lower rate, and his father was proposing to reduce the price from \$1.25 to 75 cents. Young Mr. Spreckels couldn't get answers to his questions from the officers and directors; they wouldn't listen to him. So he did as reformers do in politics; he appealed "to the people," and the people heard him gladly.

In other words, the stockholders to whom he addressed a circular elected Rudolph Spreckels to the Board of Directors. Then he found out what the matter was. Those respectable old business men on the board were dummy directors. They took orders in like manner as do our dummy legislators, and, like these despised politicians, were organized by a boss which ran this business as our political bosses run cities and states, inefficiently and dishonestly. He put investigators to work and, tho they found nothing "big," they did find something small,

very small. Besides general confusion, mismanagement, unearned dividends and inefficiency, there was graft. The directors got gas, electric light, gas ranges, coke and other supplies free. That was their price perhaps. That was the way the boss, Joe Crockett, bribed them. But the business boss had another political method of control. He gave places to relatives and friends of the directors and other influential men. The pay-roll was "padded," like a city pay-roll, to make jobs for persons with pull.

How can business men despise politics so? How can they pretend to dread the inefficiency, the pulls and the graft of public ownership of public utilities, when they know that this San Francisco Gas Company is a typical example of "private" or business management of this class of business? Mr. Spreckels cut off more than \$300,000 of useless expenses (graft, politics and inefficiency) in the first year of his control of the company.

#### THE DECAY OF CHILDHOOD.

Normal youth is analogous to springtime, giving promise to a harvest in maturity. The poetry of innocence speaks forth from the countenance of the child, and the song of purity is heard in his words. He breathes the freshness of the green fields, and hope springs as a light from his eye. But normal childhood is passing; it is being supplanted by a regrettable precocity, which makes the youth old before his years.

The youthful mind should be a fertile field for the development of the world's greatest thoughts, a home of powerful mental entities. Instead, the modern youth becomes for the most part, a narrowed plat for the seeds of noxious weeds; or growth may be so persistently forced as to exhaust the substances of the mental soil. In a recent number of the Westminster Review, Mr. Wilfred M. Leadman severely arraigns modern commercialism, the spirit of which is productive of abnormal conditions in the growing generation:

"How much may not this country be losing by her absurdly rigid educational system? She is cramming her youth with solely commercial and athletic ideals. She is completely blind to the boy's promising individuality; instead of giving him a sympathetic environment and treating him with the same minute attention to the smallest details as the animals at the zoo are treated, instead of trying to discover his innate abilities and nourishing them to a grand and glorious growth, she is herding all her boys in huge barracks, training them on the same wicked, egotistic principles, pitchforking them into the professions or trades which most suit their parents' pocket, and then congratulating herself on her splendid results. Yes, wrecked lives, distorted ideals, degraded abilities—those are often the fruits of our superb scholastic schemes. If I may risk the charge of irreverence, I would say that man in the future is to be made in the image of Rockefeller or Sandow, not God."

It is always interesting to follow the progress of the the consumption of sugar in a country, for it seems that as man's consumption of sugar increases his consumption of alcohol decreases. Among the foods that nourish the muscles, sugar is said to be as perfect and inoffensive as alcohol is imperfect and dangerous. In Germany within the twelve years from 1894 to 1906, the consumption of sugar has doubled, and scientists and others declare that in the presence of such figures it is safe to say that the consumption of alcohol has decreased in Germany.

# THE INGLENOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## "IN THE MIDST OF LIFE—DEATH."

This number of the *Inglenook* appears just as arranged by the editor, Brother Barwick, save that we have moved down his first editorial to tell the many friends and readers that he who has thus given them a part of himself, not only in this but other issues, is with us no more. Saturday morning, March 7, he moved among us about his chosen work, at noon his body was lifeless,—his spirit with his Maker. An account of his life and death will appear in next week's issue.

## "MY PEOPLE DOTH NOT CONSIDER."—Isa. 1: 3.

THE above sharp, piercing charge from the Lord of hosts needs to be emphasized again and again altho the people may not relish its force nor profit by its recital any more than they did when it was first announced. In this article we want to apply the prophet's language to the subject of child study.

All the possibilities of time and eternity are wrapped up in the child. The infinite Godhead counseled together before they brought the first human soul into existence. They also guarded man's later interests with infinite care, but the generation of a human soul today by procreation has come to mean little more than a joke among men and women in this immoral age. How many children or none, or didn't want any, or the practice of abortion, are as common topics for sporty remarks today as is horse racing or merry entertainment. Many people know this to their condemnation even if they are sly in their remarks. The sacredness of giving birth to a soul is gone. Prostitution and infanticide are on an equal social par with chastity and motherhood. The platform and the press are used to defend some of these unnatural practices. Marriage is only legalized adultery to thousands of people, many of whom express their intentions before marriage of never raising a family. Yet these people commune at the altar, lead prayer-meeting, console

sin-sick souls. In the eyes of God they are social scavengers.

But leaving this phase of this momentous question we come to another part of the question where we are common guardians. After the child is born it has rightful demands to make of its seniors, in the home, in school, in church and out in the world.

It seems that most parents are too busy chasing after gold dollars and too dizzy in the mad whirl of social life to give special attention to the study of children's needs. Home training is not studied nor discussed. It seems next to impossible to get Christian people to encourage study in this question by exchanging ideas and asking questions, altho every normal parent has large expectations for their offspring. Could our churches be induced to give as much attention to child study as our states give to agricultural colleges to improve the breed of farm stock, the world would witness a decided advance in the human race both morally and physically.

Very few papers devote much space to child study and what is given therein is seldom read. The curious, the unexpected, the catchy, the funny—these are the winners today. Why? "My people doth not consider." This was the Lord's answer at one time, and we cannot say that it has ever been fully withdrawn.

Then the twelve years of public school life is another period in which ideals of character and future destiny have a large part. Mental habits, moral tastes, physical development—these are not examined as carefully nor ranked as high in worth as is the amassing of so-called facts and fancies outlined in the curriculum.

The recent revelation of factory conditions in which pregnant women labored over time at under pay and in insanitary quarters proves the disregard of this question by America's greedy people. Puny children in these same factories working in filth and inhaling poisonous gases which adults would not endure also shows the depths to which we have sunk on this subject of child study. Were such cases rare then there would not be much room for complaint, but when the statistics in some cities prove that one out of every six of the children in the city under sixteen years old works under such conditions, then it is time for plain words to be spoken and decisive action to be taken.

Of course the readers of this magazine are hardly guilty of all that this paper hints at, but where they know of the increasing ratio which marks the growth of such hellish standards then why not set our face against the current, and with pen and tongue keep our own ranks clean and pure by precept, and by example. Silence about a known evil makes us an accomplice to the evil.

"My people doth not consider," or else they would take up the Lord's standards. At least we believe more would be said and done.

## A TESTIMONY AGAINST FOUL LITERATURE.

PROF. THOMAS, of the Chicago University, gave a lengthy discussion recently in the *American Magazine*, on the effects of yellow journalism in which sensation and emotion are the faculties appealed to. After showing that emotion is the controlling power in most people's lives he charges that the bulk of daily papers do not write to give facts and develop truth, but to appeal to the emotions of man.

He says that if such a sheet be analyzed, it will be found that it handles events and persons from the pain or disaster standpoint. The event itself is of no significance. The loss of life, the loss of happiness, the loss of property, the loss of reputation, death and destruction, is the whole story.

"But the yellow press does not stop with the singling out and overemphasis of situations of the fear-and-hate type. It distorts incidents and situations so that they will correspond to the most crude and brutal conditions of consciousness and desire. It perverts facts and manufactures stories purporting to be true, for the sake of producing an emotional shock greater than would follow on the presentation of the exact truth.

"The art of printing is so ennobled by its historical association with the pursuit of truth and with the interests of humanity, that we have been slow to perceive and credit the essential viciousness of the operations of the yellow press. The traditions of the press are so fine and printing is so deliberate an act that we have a persistent faith in the printed age; and even after we have been repeatedly deceived we still find it difficult to believe that anything printed in the papers can be untrue. But our faith is departing. At present we believe nothing that we see in the dailies, or at any rate we do not believe it absolutely, we are inclined to believe the weeklies, we will venture to form a judgment on a basis of statements appearing in the monthlies, while our old credulity in the bound volume remains unshaken."

The immorality of the yellow journal is set forth in these words:

"The yellow journal . . . is a *positive agent of vice and crime*. The condition of morality, as well as of mental life, in a community *depends on the prevailing copies*. A people is profoundly influenced by whatever is persistently brought to its attention. A good illustration of this is the fact that an article in commerce—a food, a luxury, a medicine, or a stimulant—can always be sold in immense quantities if it be persistently and largely advertised. In the same way the yellow journal by an advertisement of crime, vice, and vulgarity, on a scale unexampled in commercial advertising and in a way that amounts to approval and even applause, becomes one of the forces making for immorality."

Mr. Thomas makes a good point when he says that

an article well advertised in a community finds friends, and that when a sheet advertising crime is brought into a home frequently or daily, the subject matter of that paper will find a responsive chord in your life, or in the life of your children. There seems to be an awakening among all classes of thinking people about the corrupting influences of many of our daily papers.

Mr. Thomas also makes the direct charge that the yellow journal (all sensational papers) is a *positive agent of vice and crime* and that *the condition of morals in a community depends upon the amount of such reading matter that is found in the community*. Christians ought not further along positive agents of crime. The most of the daily papers advertise whisky, tobacco, race-track doings (gambling and all), theaters, dancing schools, cafes, where lewd women resort, and dozens of other hurtful agencies.

## POVERTY AND GENIUS.

"My folks are rich and I don't have to do this," said a young man last week, as he voluntarily gave up a good job which was in line for promotion to an enviable position. Any one can see into the future of that boy if that spirit continues to rule his life. He will soon despise labor, shun responsibility and eventually lose his ability to become independent. All of this because he had a pile of money to inherit. A parasite to society. A non-producer, an unworthy example, the progenitor of a weak, decrepit race.

Had this young man been born in a home where the needs of life pinched and pricked him into a serious activity it would have been infinitely better for him and all his followers. Then he would have soon learned how to provide for himself and others; thus contributing to the common fund of daily blessings. He would have held his position until he became foreman in his work and perhaps the head of a prosperous business firm. He would have become a benefactor, while as it is, he may become a malefactor.

Often poverty is a blessing in disguise. The geniuses of all ages have been reared and lived in poverty. There seems to be a vital relation between necessity and greatness. Or in other words, poverty is a blessing as well as riches. If you want to satisfy yourself fully that poverty gives a man more chances to bless his fellows that does wealth, just make out a list of the names representing the various classes of persons whose names are revered and stand as inspiration stations in the onward march of human progress, and see how many wealthy men are found in the list, that is, how many were born wealthy.

We do not mean to say that wealth is a curse. While it often is, yet it need not be, for it has rich blessings to bestow when properly used.

WORRY never made anything—but wrinkles.

## FOOD PRINCIPLES

LENNA FRANCES COOPER, Principal School of Hygiene and Cooking, Battle Creek Sanitarium

VEGETABLES as a class are chiefly valuable for two things, viz., for the mineral salts which they contain and for the bulk which they give which is due to the cellulose. When this cellulose becomes hardened and woody, as it does in many old vegetables such as parsnips, carrots, turnips, etc., it is undoubtedly a menace to digestion.

This should be rejected before the food is swallowed. Besides these two important constituents or Food Principles, vegetables also contain other food principles, namely, water, starch, sugars, albumen, etc.

Vegetables contain large quantities of water varying from about 75 per cent to 95 per cent. The cucumber for instance contains 96 per cent water, leaving only 4 per cent nutritive value.

Starch is an important constituent of some vegetables, namely, potatoes, corn and green peas. If we were to examine microscopically the starch from these different vegetables we would find that the little grains from each source have each a definite shape and characteristic, just as much so as do the potato and apple when viewed with the unaided eye.

Then if we were to make further examination, we should find that each starch grain is composed of two distinct parts, an outer portion cellulose which forms a covering or sack for the inner portion which consists of tiny granules. These granules are the smallest division of the starch grain and they give starch its peculiar characteristics.

The effect of heat upon starch is clearly shown in the making of the cold and the cooked laundry starch. In the cold starch, cold or only slightly warmed water is used and when this starch is allowed to stand for a time, the starch all settles to the bottom and when the water is poured off it can be used again or for any purpose for which starch is ordinarily used. But if boiling water is used, the starch grains lose their identity, become opaque, and the water is thickened. This is because the cellulose is broken by the heat and the granules escape in much the same manner as apples fall from a sack when the string is cut. Once free,

they immediately take up the water, producing a thickening of the water with a more or less gelatinous nature and the identity of the grains is forever lost. We can in no way separate them from the water again.

This is what always happens when we use flour, corn starch, or any other starchy substance for thickening. When boiling water is poured on the dry starch the grains on the outer part of the mass are broken and the granules take up sufficient of the water to form a pasty coating on the outside and we thus have a mass which in cooking is sometimes known as a lump, hence it is always essential to moisten the starch with sufficient cold water or liquid to surround each grain and to separate it from the rest, so that each one will receive an equal share of the boiling liquid.

When a potato is baked, the same thing occurs. The heat breaks the cellulose of the starch grains setting free the granules which take up the water of the potato and thus produce that mealy condition which is so much desired.

Most people think that any one can boil potatoes. While it is one of the simplest things in cookery, yet there is a science in even that. To prepare the potatoes, pare as thinly as possible, as the best part of the potato lies near the skin, place in cold water to keep firm. If the potatoes are old it may be necessary to let them stand in cold water an hour or so, before paring. Remove from the cold water and drop into boiling water and let boil gently from fifteen to twenty minutes, according to the size of the potatoes. Have the potatoes as nearly the same size as possible to insure uniformity of cooking. When they begin to get tender pour over them a cup of cold water, which will check the cooking on the outside and allow the cooking on the inside to proceed, thus making them more evenly cooked throughout. When they have come again to the boiling point, drain off the water, and shake over the fire until the potatoes are white and mealy. Salt may be added at the table, or if desired, may be added after ten minutes' cooking.

**Potato Croquettes.**

1 pint hot mashed potatoes. 2 tablespoons butter.  
 ½ teaspoon salt. ½ teaspoon celery salt.  
 ½ teaspoon grated onion. 1 egg yolk.

To the mashed potatoes, add the butter, the seasonings, and lastly the beaten egg yolk, and beat vigorously. If desired a teaspoonful of finely-chopped parsley may be added also. Shape into round oblongs or any preferred shape, dip into cracker crumbs, then into a beaten egg to which has been added one tablespoon of water or milk, then dip again into the crumbs, place in an oiled tin and bake in a hot oven until nicely browned.

**Baked Cabbage.**

1 medium-sized head of cabbage.  
 2 eggs. 1 pint milk. salt.

Chop the cabbage as for stewing, steam or boil until tender. Drain off the liquid if boiled. Beat the eggs and add to them the salt and milk. Pour this over the cabbage, place in the oven and cook until set like a custard.

**Potato and Celery Hash.**

1 pint diced cold potatoes. 1 tablespoon melted butter.  
 ½ cup chopped celery. Salt.

Prepare the potatoes by cutting into cubes about one-half inch square and the celery by carefully washing and cutting or chopping into small pieces. Mix and add salt and place in a baking dish. Pour the butter over them and set in the oven, cover for fifteen minutes or until thoroughly heated, then uncover and let brown.

**HOW TO KEEP PIE DOUGH.**

Now for a good pie crust that will keep for a week and the last pie as good as the first. For busy mothers, how nice to have it all ready to pinch off enough for a pie, roll out quickly and fill and bake. How nice not to have to stop first and make the pie crust! Take three cups of flour, and one cup of lard, a pinch of salt; mix. Break an egg in the cup now and beat; then fill with water, stir and mix in your pie crust. Bury it in the flour bin. Be sure to have it entirely covered with flour to exclude the air. Never mind the hard lumps. After taking it out of the flour, roll out just the same as the lumps will disappear in the baking.

**A WORK BAG.**

Have black sateen for the outside, the lining should be of some pretty contrasting color. For the bottom take a piece of pasteboard or cardboard about one-quarter yard in diameter, smoothly covered on both sides with the sateen. Around this sew slightly full the three strips, two of the sateen, one of the lining, have it as wide as desired, the outer strip of the sateen should be only half as wide as the other and sewed to the other at intervals to form pockets while the wider one should have a draw string at the top.

WITHOUT earnestness there is nothing to be done in life.

**THE FARM GARDEN.**

D. Z. ANGLE.

THE importance of the garden, and the necessity of its presence on most every farm we think is apparent, or should be to every one. Usually the housewife does most of the work of gardening, if physically able. But if she lacks in health, strength, or time, why shouldn't the "husband" give his assistance, or hire some one, since the end certainly justifies the outlay of time and expense. At least a strong boy or man should do the heavy work, like plowing, spading and raking. After planting is done, much of the cultivating can be done by children and women in the cooler parts of the day, providing the garden is small or medium size. If it is large or the season rainy, it will require more work and much steady effort to plant, properly cultivate, and grow the plants, while keeping down the weeds, for killing weeds is the main thing to do after obtaining a good stand of plants. And the best way to keep down weeds is to cultivate the ground as soon as dry enough after a rain, before, or just after weeds start to grow. Also by keeping top soil loose and friable, the lower soil remains moist, even if weather becomes dry, and adds sustenance and growth to roots of plants instead of quickly evaporating as it would from an untilled hard surface soil where the weeds soon obtain a good start and are then doubly hard to eradicate.

We prefer, where convenient, to have the garden longer than it is wide, so that most of the plants may be set in long straight rows, which renders planting and cultivation more convenient and rapid. In setting plants, stretch a cord tightly between stakes on long rows as a guide to set by. We usually grow some potatoes, either Irish or sweet, and sweet corn in garden, which are best planted and cultivated by aid of one horse and plow. These may also be employed to some extent in cultivating tomatoes, cabbage and lima beans, until plants are too large to go between without injuring them, they being set or planted in checks about thirty inches apart each way. We use a narrow strip eight or ten feet wide along one side of garden in which we raise onions, beets, lettuce, peas, wax beans, radishes and maybe early cabbage or tomatoes, parsnips, asparagus, etc. The onion seed, or sets are sown or drilled across this strip in rows about ten inches apart. Beets, peas, beans, parsnips and carrot seed may be sown in rows about the same as onions except thinner in the row. Afterwards, if too thick, thin to suit space required for each plant and strength and power of soil to produce to profitable size or quantity. Sow the lettuce in a square patch, radishes in rows like beets, etc., or the seed stuck around edges of beds or at ends of other rows. The cabbage or tomatoes here, should be set not closer than twenty or thirty inches apart in checks. In cultivating we use either a double or single wheel hoe.

or both. Sometimes one, then the other, is best suited to the needs of the growing plants. Either one is a great improvement, in most cases, as a time and labor saver over the common hoe that "Markham's man" used, though the hand hoe, too, comes handy at times in some places. But we prefer to do our work with least expense of time and labor possible, and believe it is best to use horse power wherever practicable.

First plow the garden with a team, then harrow what is to be planted soon, leaving balance lay rough so rain will not pack it so hard or weeds will not start so readily. Of course in a dry time or season, the clods get hard, but generally we can arrange it all right, and when ready to finish planting late vegetables, we harrow or rake as soon after a rain as the soil will do, or replot if too weedy, then smooth and plant. Garden should be heavily manured before plowing, either in fall or spring, with well-rotted manure. A rich soil, properly prepared, planted and cultivated will insure a good yield of wholesome vegetables such as no farmer should be without.

*Mt. Vernon, Ill.*

#### A FEW HOUSEHOLD HINTS FOR HOUSE-CLEANING TIME.

TRY cleaning the cupboards, closets and dresser-drawers in March and note later how much the regular housecleaning has been lightened.

If you do not want to revarnish the hard-wood floors and woodwork this spring, try rubbing the marred places with a cloth dipped in turpentine. Varnish is largely composed of turpentine and the oil serves quite well as a temporary substitute.

A kerosene cloth is better than soap and water for removing the inevitable grease that has deposited itself on the upper woodwork of the kitchen during the winter. It not only removes the grease more successfully but it is done with greater safety to the paint and varnish.

If the kitchen paper is too good for removal and too soiled for neatness, try rubbing, good and hard, every spot of the walls and ceiling with clean cloths. By so doing you will save the expense of paying a cleaner and make the paper look clean and glossy.

Lace curtains or thin white curtains of any material last much longer and hang or drape more gracefully if unstarched.

The most satisfactory way I have found for hanging lace curtains is to baste two two-inch tucks in the long end that must be thrown over the pole. A two-inch hem and a two-inch tuck in which to slip the pole—all together makes an attractive heading for the curtain. In length the curtain only reaches the top of the mopboard.

EXPERIENCE is the best teacher, it is the father of wisdom.

#### THE WILD YAM AS AN ORNAMENTAL VINE.

MRS. M. E. S. CHARLES.

THE wild yam (*Dioscorea villosa*), shown in the illustration, is a native climber that has been used with good effect for hiding unsightly objects. In this instance it is used as a screen in the back yard of a village lot. It was planted along a four-foot wire fence. The top dies down each year, but it grows so rapidly that by the time it blooms, which is in June or July according to latitude, it has not only reached the top of the fence, but has covered shrubbery ten to twelve

The Wild Yam.

feet high. The blooms are very inconspicuous, but if one is lucky enough, which means that one should locate the plants the summer before transplanting from the woods, to get both staminate and pistillate kinds, the seed pods are ornamental and remain on the vines for months.

The broad, heart-shaped leaves are smooth on the upper side while the under surface is downy. When the yam first comes up in the spring it grows several feet before showing any sign of leaves. But later it makes up for any deficiency in that respect. It does well in partial shade and will be found growing in the woods climbing over shrubs and brush piles throughout the Central States.

#### GARDEN AND FLOWERS.

LUCINDA MILLER.

I THOUGHT I would write a few thoughts on gardening. I begin early in spring as soon as the ground will permit. The first I sow is a bed of lettuce. Cultivate the ground in March and sow it so that it will be ready for early use. When it is used up the ground can be cultivated and sown to beets or radishes for later use.

Then as soon as the ground is warm in April sow peas, drill in rows; have the rows two feet apart. That will give plenty of room to cultivate. Then I plant beans in hills two feet apart. I plant onions and

radishes and cucumbers. Some think you cannot have cucumbers early but I have good luck with early ones. I sow early cabbage and tomatoes; set some in rows and set a plant in every vacant spot. You will be surprised how much you can raise by setting a plant in every place you can find for one.

When the peas and beans are done bearing they can be pulled up and the ground cultivated again and sown to turnips. This way you can raise a good deal of garden on a small piece of ground.

Now as to flowers. I sow some around the edge of beds. I had nice nasturtiums around my beet bed last summer, and sweet peas grow well near the fence, so they will run on it. A wire fence is especially nice. Sow as early in March as you can.

*South Bend, Ind.*

### LAUNDRY WORK.

THE reason wash day is so dreaded by the housewife and, in many instances, by all the members of the household, is because the work is not rightly managed and proper preparations made for the work of this day.

The careful housekeeper has found that her work on wash day is made much easier if the clothes to be washed can be soaked over night, as this loosens the dirt and makes them much easier to wash. A small amount of borax dissolved in the water in which the clothes are soaked is a great help in softening and removing the dirt and in whitening the clothes. Borax costs more than salsoda. But it does not injure the fabric as do the stronger alkalies, so in the end it is the cheaper.

The thoughtful woman has also found out that it is far more economical to mend clothes before they are washed, for often the rents are made worse in washing and often garments are made useless by neglect. All stains that will "set" in washing should be removed before the clothes are put to soak. The stain should be examined and removed by the process most effective for the kind.

It is best to make all possible preparations, such as cutting the soap into pieces ready to make the soap solution for the boiler, before wash day arrives. Preparations for the meals of wash day should also be made in advance.

Washing Woolens—Great care needs to be taken in washing woolens, for unless they are washed properly they will shrink and become stiff and harsh. It is better to have the temperature of all the water used about the same. Never rub soap onto woolen garments. Make a soap solution and put it into the water in which the garments are to be washed. Always shake and brush the garments well before wetting them. Have the suds and two rinsing waters warm and add a tablespoonful of borax to each one.

Work the suds through the material by lifting, squeezing and kneading. Never rub or twist woolens. After rinsing through two waters run through the wringer and hang out to dry, and do not allow them to freeze. Take from the line before quite dry and press with moderately hot iron.—*Lotta I. Crawford.*

### DESTINY.

AURELIA HARRIET WORTH.

We speak each other in passing  
In the hurry and bustle and strife,  
As we meet on the dusty highway  
Or out on the ocean of life.

We speak each other in passing  
As we sail thru the mist and the rain,  
Then creep away in the darkness  
And are lost to sight again.

Like ships that pass in the night  
Each go a different way;  
One on the troubled ocean  
The other the tranquil bay.

Like ships that pass in the night  
We part to meet no more,  
As we sail on the restless ocean,  
Or wreck on the rocky shore.

For the ship that paused in passing  
And spoke thru the mist and rain,  
Has sailed away in darkness,  
And is lost to sight again.

And perchance when the voyage is over,  
And we anchor in the bay,  
We will meet again the vessel  
That spoke in passing our way.

Cairo, N. Y.

### A TIME FOR ACTION.

It is only a few years back that I would rather quibble over the form of some Greek verb in order to get an argument to substantiate some pet idea; or pile up testimonies of Greek philosophers; or recite statutes of Roman jurisprudence; or relate the heresy trials of the dark ages than do anything else in the world. Metaphysics, paragraphs of ethical thought and masses of book lore were my delight. But now I see a lost, struggling mass of humanity helplessly floating down the surging, seething stream of time into a dark chasm out of which come the bitter wails of a misspent life, the admission of some hidden crime, the soul's intuition of Satan's presence and the mad curses of those who have been led thither by sin. It is the cry for help, the wail of despair and the moanings of souls entering eternal torment.

Shall I sit idly by and witness this awful scene when it is possible that I can save a few of these my unfortunate brethren? Some one saved me from that very pit. Shall I mock that good deed? No. "Those who turn many to righteousness shall shine as the stars forever and ever." That is enough for me. Do you want more?

## LOST IN A DAKOTA BLIZZARD.

EMMA HORNING.

SEVERAL of we young folks were spending the afternoon at one of the neighbors. Towards evening the snow began to creep over the ground giving signs of a blizzard. We made ready to leave as soon as possible and knowing the way so well we thought there was no danger. The moon was shining thru the new blown snow making it very charming to light, young hearts, but we failed to turn at the right place and before we were aware, the road was nowhere to be found. No fence, houses many miles apart, and snow everywhere, made the situation a serious one when we left our minds dwell on it.

But we supposed we were going the direction of home and would soon strike some familiar object so we were only half alarmed and half pleased to think we were really having the experience of being lost in a snow storm. We were well fixed for cold weather. Each of us had on a heavy, long fur coat and were wrapped in plenty of robes. We were enjoying it more than the horses for the snow was deep and they had no road. On we went eagerly scanning the dim horizon for a welcome light. An hour went by but nothing was to be seen but the falling, blowing snow with the dim moonlight weirdly gleaming thru it. Another and another hour passed by, fingers and toes began to feel very uncomfortable, creeping chills began to creep all over us. The horses could only plod slowly along. We were really becoming alarmed. What would we do? Unhitch, turn the sled over to keep the wind from us, then wrap ourselves well in our robes and let the snow drift about us which might keep us from freezing; then turn the horses loose so they could keep moving and not suffer from the cold.

These were our plans when, "What's that?" All was movement. On examination we found it to be a railroad grade eight or ten miles in the opposite direction from home. We turned, more satisfied but still very uncertain as to the result. Keep going, tired horses. Poor things! Look! can that be a light? Watch! Yes, No. But time revealed a light from a truly welcome window. 'Twas an old stone house about five miles from home. It was occupied by an old bachelor who was caring for a flock of sheep during the winter. He made us very welcome to his fire-side, but the wind whistled thru the stone walls, the little cook stove kept red hot could keep the atmosphere above the freezing point but a couple feet from the stove, but we were not lost. Our host was very interesting and we spent some time listening to his stories of early times in Illinois, of muddy weather, corn husking, and thrilling incidents, keeping time to his narration as he walked to and fro across the floor in the process of keeping warm. When stirring adventures began to "run out" and eyes began to droop he said he was very sorry he could give us no bet-

ter accommodations for sleeping than sitting by the fire, but he assured us that there was plenty of coal to keep the stove red. After making things as comfortable as possible, he said it was time for him to go to "roost," and wrapping himself up in a blanket he lay on a pile of hay in the corner.

We sat by the fire with our fur coats on while our faces burned and our backs felt the frost line, but this was far better than under the sled-box in a snow-drift. We tried to sleep but with little satisfaction and were very glad when the glimmer in the east revealed the coming of dawn. We were soon on our way home, arriving just in time for breakfast, greatly relieving the anxiety of the parents who suspected our trouble and kept a light burning for us all night in the upper window. Breakfast over, we just had time to get to the schoolhouse to open a new week of school. I am afraid the schoolma'am did not hear all the pupils said that day for she once found herself asleep in the center of one of the recitations.

*Fruita, Colo.*

## THE ANSWER.

WE have been asked to give an answer to the question under the head of a Skull Cracker, found on page 1,259 in No. 53, issued Dec. 31, 1907. The problem is as follows:

Three men took eggs to market. A had fifty eggs, B thirty, and C ten. They sold their eggs at the same price, yet C managed to get as much for his ten eggs as A and B did for theirs. How could he do it?

Whenever one of the three men sold any eggs they all sold at a uniform price, and continued to do so until all were sold.

This is no catch question, but one of possible occurrence which your grandfathers worked long ago. Can you do it?

Here is the explanation:

A sold 49 eggs, at one-seventh of a cent each, which gave him 7 cents. B sold 28 eggs, at the same price, which gave him 4 cents. C sold 7 eggs, at the same price, which gave him 1 cent.

Then A sold his one remaining egg for three cents. This made ten cents in all for A. B sold his two remaining eggs for three cents each, which made him ten cents in all. C sold his three remaining eggs at three cents each, which made him ten cents.

In the hog problem which followed the egg question the men made a mistake in trying to make unequal quantities of meat at unequal prices give an average sum for each.

While the above questions seem useless yet there are thousands of daily cases where neighbors and households wrongly divide matters by not noticing the right equation in larger and smaller quantities at various prices.

## A CHILD STUDY.

RICHARD BRAUNSTEIN.

THE Bible is unique among all the works of ancient times in its attention to the child. There is but one child in the Iliad of Homer and none in almost all the other books of that age. But the Word of God gives us the childhood of nearly all of its prominent characters. The first glimpses we get of Joseph and David are those of early youth, while we know Moses and Samuel almost from their birth. The advent of the Christ into the world as a little child has dignified the estate of childhood and has given to both childhood and motherhood a new significance in art and literature. Surely the keynote of all inspiration in all that has been most beautiful in literature and art, most ennobling and most universally uplifting, was struck on that night when the holy child was first nestled in its mother's bosom.

Christianity is easily distinguished from all other so-called religions by its tender regard for the child. Heathenism looks upon women and children with disdain, and it is not so many years ago when they offered up their children as sacrifices to the Ganges, and other gods of their false worship. The family life as we see it and enjoy it, is peculiarly a Christian institution, wherein the child is recognized as having inalienable rights before man and before God. Over the entrance gate of a certain playground in London, patronized chiefly by the poor, is this sign: "No adults allowed to enter unless accompanied by children." We discover here a principle, that the child is the germinal fact of all life, and its essential foundation. We approve of the sign.

How many of us in our treatment of the child really apprehend its personality, or think of the child as a distinct individual element of society? We are always looking for the man in the child without stopping to realize that the child has a life all its own before it becomes a man or a woman. We are forever troubled with what we think the child may be, and are not content to work with the child as it is. The child of Mary was a babe before he became the man Jesus. Across the deep, blue sea, the words are over the play-ground gate of the world's greatest city, "No adults allowed unless they have children with them." And beyond the deep, blue sky, in another city, whose builder and maker is God,—over the entrance gate to that city whose streets shall be full of boys and girls playing therein,—are to be found the words, "Except ye turn and become as little children, ye shall in no wise enter in."

In the study of an eminent scholar and minister is a rude brick from the palace of Sardnapulus, that must be about 2,500 years old. And, yet, for all those twenty-five centuries it has preserved upon its face the plain marks of a human hand. Some workman had taken it up, in a plastic state, before it had hard-

ended in the sun and it bears to this day the visible proof of that hand that took it up in the ancient brick-yard.

In the world of life about us there are many human souls, who in the plastic state of impressionable condition are receiving the touches of good or evil that will never be effaced. And I believe that there are no years when human life is more sensible to the touch of the life that now is than those first years of a child's life—tender, confiding, trusting, innocent, dependent.

According to the common law, the parent is charged with the duties of feeding, clothing, educating and protecting his children. This, of course, is regarded as a burden without compensation until such time as the child's earnings may lighten it. The child's value, therefore, is in proportion to his ability to earn, a proposition which when followed to its logical conclusion makes the life of the child one valueless dummy.

Not until we have made a study of the child from the standpoint of the man of Galilee shall we ever realize its true worth, and come to see, with clearer vision than ever before, that the child is the germinal principle of all manhood, and as such ought to be given the very best care and culture. For what shall it profit us if we gain the whole world but lose our own children?

## WHAT WHISKY DOES.

Dr. Podstata, superintendent Northern Illinois Insane Hospital, at Elgin, says of whisky when speaking of its effect on parent and offspring:

"A very serious topic for consideration indeed, but not the worst. Far worse in the opinion of a physician is the influence of alcohol upon the offspring. I am able to quote Dr. Demme in presenting absolutely positive comparative data gathered by him. Demme, in order to obtain light upon this question, formed two groups of parents, which groups each numbering ten families, he carefully followed for the interval of twelve years. In the first group were parents who drank alcoholic beverages, in the other there was no consumption of liquors. The group of drinkers had a total of 57 children. Of these only ten, that is 17½ per cent, were fully normal. The remainder suffered from various diseases and mal-developments, all of them pointing to degeneracy. Twenty-five of the children died within the first few months of their life.

In the other group there came 61 children. Of these only five died within the 12 years. Four of the children suffered later from diseases of the nervous system and two had evidences of mal-development. The remainder, that is 50 children, constituting 81.9 per cent, remained entirely healthy. It would be superfluous to say any more regarding the effects of alcohol beyond possibly summing up the direct and indirect effects so far as they pertain to the nervous system.

1. The loss of moral and ethical sense.
2. Insanity of jealousy.
3. Delusional insanity with hallucinations.
4. Delirium tremens.
5. Epilepsy.
6. Paralysis.

**MY MISSION.**

E. C. HOLLAR.

O! if I were a songster gay  
 With spark of poet's fire,  
 The names of kings I then could take,  
 And tune them to my lyre.

But 'tis not given me to sing  
 With voice of angels high;  
 Nor yet to write with form so true  
 That Pope should with me vie.

With charming words I am not called  
 To greet the noble's ear,  
 But with my simple rustic verse  
 To bring the lowly cheer.

Or, if I were an orator,  
 And speeches great could frame,  
 My nation's worth on hill and mead  
 I might with length proclaim.

But Athens' men hath struck me dumb,  
 And Henry holds me spell;  
 So aught of good that I would say,  
 In simple words must tell.

For 'tis not given me to speak,  
 With thundering words and great,  
 But to in verbage smooth and plain  
 Great sentiments create.

And other gifts, if I should have,  
 The world I might amaze;  
 And like the three of Athens' great  
 Stand wrapped in misty haze.

But I'm not built for wonderment;  
 Nor on the genius plan,  
 But in my plodding way to show  
 The brotherhood of man.

And, after all, these lives of ours  
 Do count for naught or much,  
 According as these hands of ours  
 God's righteousness do touch.

Hardin, Mo.

**WHERE DID SOME OTHER ANIMALS COME FROM?**

A FEW years ago some states in India were over-run with rats. Not just simply enough to annoy people a little, but whole armies of them traveled across the country and destroyed so many crops that food had to be sent to the natives. This continued for a few months and then the rats suddenly disappeared. Who can explain?

Thousands of settlers in Kansas witnessed the flight of locusts in that state, about thirty years ago. One day a buzzing noise could be heard overhead. Then the sunlight became dim and grasshoppers began to drop here and there. Turkeys and chickens nearly ran their legs off at first to get the grasshoppers as they fell, but after a while they did not need to run for them. The sun was hid behind a cloud of grasshoppers and they began dropping everywhere, even so much that turkeys ran for shelter.

In a few hours after the grasshoppers fell the corn-

fields were eaten bare by them, the grass and other vegetation was all gone. It was total destruction to all farm crops.

These grasshoppers lingered for three days, and then one forenoon they spread their wings, soared aloft, and where did they go to? No one will ever understand whence nor whither about this strange and destructive phenomenon, but we cannot deny its reality. A large part of two states was affected by them, and thousands of people were made poor in two hours' time.

**A HOG THAT LIVED OVER TWO MONTHS IN A STRAWSTACK.**

A NEIGHBOR missed two hogs on the day he threshed his wheat and he suspected that they had gone to sleep around the strawstack at noon, and were covered up with straw.

This was in August. One cold day in October, this neighbor, Mr. Williams, was gathering up loose straw around his stack for bedding his stock in the stable when he heard a hog grunt altho there was no hog in sight. He had heard of delirium tremens, but being a teetotaler he concluded that his ears were not deceiving him. The grunting noise came from within the stack. He finally located the noise, and, remembering the two lost hogs, he eagerly removed some more straw, and behold, there stood a lean, gaunt, razor-back porker, poorer than the lean kine of Egypt, but able and glad to renew old acquaintances, after a confinement of nine weeks and two days in the bottom of a strawstack!

The hog was afterward fattened and sold, but his history was never written. While in this prison he ate his mate, which made it possible for him to live so long in such close quarters.

**THE CHILDREN.**

AGNES NEFF.

All day long we hear the patter  
 Of the busy little feet;  
 All day long their silvery voices  
 Come to us in accents sweet.

Little, dimpled hands are busy  
 In the sunshine, or the rain,  
 Strewing playthings on the carpet;  
 Leaving prints upon the pane.

Soiling little frocks and faces  
 In their happy, childish glee,  
 While from beneath the golden ringlets  
 Star-like eyes beam merrily.

And when the evening shadows close  
 Those dreamy eyes in sleep,  
 Bright angels round their little beds,  
 Their nightly vigils keep.

THERE will be good will in all when God's will is over all.

## For SUNDAY READING

### RESCUE THE GIRLS.

#### Crittenton Home for Fallen Women.

THE great work of Charles N. Crittenton in establishing homes for fallen women is one of the monuments of personal work, equalled by few men in this generation.

Through his untiring personal efforts for a period of twenty years he was enabled to establish and open *sixty-five* homes, through which thousands of girls and women have been rescued from lives of sin and shame.

Mr. Crittenton was not a preacher or evangelist, but a successful business man of New York, who devoted most of his time to this great work.

He started in life a poor boy, became wealthy in the wholesale drug business, let his assistants conduct the business while he went out to *rescue the fallen*.

His story of the inception and prosecution of the work is as follows: "Many years ago Jesus gathered into his arms my little Florence. For months my heart was in rebellion against God because he took my child. But one day memory recalled Rev. 3: 19 which I had learned in Sunday school—'As many as I love, I rebuke and chasten,' and I could not get those words out of my mind, until I broke down weeping, and a voice consoled me by 'you can come to her.' I wrestled in prayer until, through my blinding tears I felt the 'peace be still' and a great calm came over me, and like a tired and weary child I rested on his bosom.

"I promised my Savior then to follow his leading. Soon after I was asked to lead a meeting and my promise prompted me to accept. After the meeting a night missionary requested me to accompany him on a trip to the slums, and I accepted.

"We visited saloons full of drinking, cursing and gambling. Then entering a side room of a saloon we came upon two girls, and the missionary sang: "There is a fountain filled with blood," then prayed. I never heard such a prayer before or since. He not only prayed for those two girls, but for all mothers' girls in New York. After prayer he asked me to talk to them, and I told them of my grief, my rebellion and my salvation. They were heart-broken as we gave them 'Good-bye and a God bless you, go and sin no more,' when, like a flash, it came to my mind, Where can they go?

"No doors open, only doors of shame similar to the one they were in. From this reflection came the founding of the first Florence Mission later changed to Mother Mission from which have sprung many others in different cities, where any tired, weary moth-

er's girl can come at any time of day or night and find consecrated Christian mothers as matrons and assistants that will welcome them in, and let them rest their weary heads on their bosoms while they encircle the tired body and tell them the wonderful story of Jesus, the Mighty to Save.

"The girl whom God used to open the door of the first Florence Mission lived nearly two years after that, and hers was one of the most remarkable of conversions. She had a wonderful faculty in committing the Bible and quoting the same in preaching. People came from far and near to hear her thrilling eloquence. One of her last addresses was to 3,000 people in the Cooper Union who were held spellbound by her eloquence."

Mr. Crittenton spent four years as a night worker in the slums of New York City, which, in trying also to carry on his business in daytime, so broke his health that his physician ordered a trip abroad.

He went abroad and visited all the large cities of the world, studied the conditions of the street girls, and in the shops; investigated any and all movements set for their alleviation; addressed thousands of girls in the leading cities; and returned to this country with his heart bowed down to know that in all the world of sorrow and suffering womankind, not one agency of redemption was successfully established.

He at once set himself to the work; adopting plans and improving on them as his experience warranted, until this mighty circle of sixty-five homes for fallen women attest his labors in strengthening the weak, rescuing the fallen, and bringing thousands into the fold.

"God bless the Rescue Missions,  
Wide open, day and night,  
To bring the erring daughters  
From darkness into light;  
To meet the love of Jesus,  
His cleansing grace to know,  
Though sin has blackened deeply,  
He'll wash her white as snow."

—*Sunshine Mission Echo*.

### A PRAYER.

CARL NELSON.

My heart is speaking,  
God, in the stillness, to thee;  
My soul is seeking,  
Light up the pathway for me.

Hope is redeeming,  
Let me, O Savior, not be  
Lost in the gleaning;  
Garner me safely to thee.

Heal my demerit,  
Warm my cold heart with thy glow,  
Lead now my spirit  
Into the way I should go.

Cando, N. Dak.

## CREAM OF MAGAZINES

### SHEEP SUCCEEDING CATTLE IN THE WEST.

The cattle barons of the West, who once held undisputed sway over the great public domain, have been displaced, in the last few years, by new lords of wealth and power,—the sheep men.

Travel over the Pecos country in New Mexico, where John Chisum ruled like a lord of old, and where his baronial retainers fought desperate battles with the retainers of rival cattle barons, and what will you find but sheep, and more sheep? To be sure there are plenty of cattle left in the country, but they are split up in tiny herds among the small ranchers, while most of the unfenced range is grazed over by great flocks of sheep, of all grades and values, in charge of Mexican herders in all states of somnolency. In Montana, Wyoming, and Colorado, where the dust of the cattle trails once clouded the blue skies, the old highways of the steer are grass-covered, and,—the mockery of it!—are fed over by dusty-backed herds whose eternal "ba-a-a" brings a curl of contempt to the lips of the cowman. Where the cowboys once faced the storms of the prairie, in their yellow slickers, the sheep herder now crawls into his canvas-covered sheep wagon, where he lives in comfort through the hardest "norther," and in summer, even to the grassy slopes of the Rocky Mountains, above timber line, one will come upon sheep camps.

#### The Sheep Interest Coming to its Own.

For twenty years the sheep man has fought for every foot of ground he has gained in the West. He has fought pitched battles with cowmen and ranchers, and has seen his sheep slaughtered by ten's of thousands, and his herders killed or driven in ignominy from the disputed territory. But always the sheep owner has come back across the "dead line," until finally his enemy has yielded place. Today the sheep man is the stronger, instead of the weaker party. A few months ago, when there was a raid on a sheep camp in northern Wyoming, the sheep men offered a large reward for the capture of those who had slain the sheep and burned the sheep wagons. Furthermore, they armed their herders, and, in some instances where danger seemed most threatening, stationed guards about the flocks and announced that any cattle interests that sought a fight would be accommodated. Such boldness would have been unthought of ten years ago, and the case simply shows how the sheep men have grown in power until practically they are the dictators, instead of submitting to the dictation of others.

The sheep man has had many prejudices to overcome. Chief of these has been the theory that sheep destroy a range, trampling out the roots of grass and rendering a feeding ground valueless when once they have passed over it. The folly of this statement has been demonstrated in the West, where the same grazing grounds have been used by millions of sheep for years and are as good today as when the sheep first went on them.

### The Sheep Herder's Life and Duties.

Naturally the central figure in the sheep business is the herder. He is the man upon whom the owner depends for the safety of an average flock of from 2,000 to 2,500 sheep, which may be worth from \$10,000 to \$30,000. It has been the custom to look upon the sheep herder as a man who takes up this employment because he is "locoed" or because he cannot do anything else. Nothing could be further from the truth. No sheep owner could put so much responsibility on the shoulders of an incompetent or irresponsible man. The herders are selected from the best material the labor market has to offer, and are paid from \$50 to \$75 a month and board. The herder is furnished with everything he needs, and there is no limit to the quantity or quality of his fare. He is given carte blanche to order what the market affords, and the "camp tender," who comes with supplies once or twice a week, sees that the order is promptly filled. The sheep wagon, in which the herder lives in winter, is a veritable house on wheels. It is a canvas-covered wagon, containing cookstove, bunk, cupboard, and in short, everything that can make life bearable for the herder. In one of these wagons a man can remain comfortable while a "norther" rages without. In summer, while in the mountains, he lives in a tent, but this is all a man requires among such ideal natural surroundings.

In the spring, at lambing time, is the herder's season of responsibility. It is then that a May snowstorm will wipe out the year's crop of lambs; if the flock is caught in a bad place, and it is then that the band must be closely guarded against the dangers from coyotes and wolves. Care must always be exercised in changing feeding ground, lest the sheep get among poison weeds and die. Countless sheep have been lost in this manner, the herder being unaware of any danger until the poisoned animals began to drop by the score.

#### Sheep-Shearing by Machinery.

Sheep-shearing time brings to the fore another interesting class of men,—the shearers. These men begin their work in the south, where, the shearing is early, and work north through the season, finishing their work in Montana and Canada. The shearing is done by contract, in pens that are equipped with costly machinery. Formerly sheep were clipped by shears, but the modern shearing knife, run by steam or electricity, is used nearly altogether today. The machine is not much faster than the old-fashioned shears, but it does the work in much more cleanly fashion, and leaves less wool on the sheep. The saving of from a quarter to a half a pound of wool to each sheep amounts to a great deal of money when so many millions of sheep are sheared in a season.

The shearing is done early in the summer. The herders bring up their bands of sheep and run the animals into pens. The shearers in the pens grasp the

animals and soon the keen knives are cutting through the wool. The fleece comes off almost in a single garment, so neatly do the skilled shearers work. Despite the exhausting nature of the work, the men standing all day in a stooping posture, some astounding records are made. One shearer, Frank Hewitt, of Saratoga, Wyo., who is credited with being the champion shearer of the United States, won a medal at the Chicago Exposition, in competition with nineteen other shearers, by shearing 100 sheep in three hours, and twenty-seven minutes. It is said that this shearer turns out an average of 175 sheep a day throughout a shearing season. With a dozen men shearing sheep with such rapidity, it is no wonder that the wool is soon stacked high in sacks at the sheds, ready for shipment. About 100 sheep a day may be accepted as the general average for a shearer. The operators get 8 cents per fleece, so it is seen that their pay is relatively high, though it is none too much when one considers the exhausting nature of the work and the shortness of the shearing season.—Review of Reviews.

### THE NEGRO IN THE UNITED STATES.

In the large cities the negro element is growing "more rapidly, perhaps, than any other single element of urban population"—and this in spite of the fact that in these Northern negro communities the deaths are almost invariably in excess of the births. But it appears that there is a tide of negro immigration, constantly rolling upward from the South that more than counteracts the effects of a high mortality. Thus we read:

"In 1880 Chicago had only 6,480 colored people; at present it has about 45,000, an increase of some 600 per cent. The census of 1900 gives the negro population of New York as 60,666. It is now (1907) probably not less than 80,000. Between 1890 and 1900 the negroes of Philadelphia increased by 59 per cent, while the Caucasians added only 22 per cent, and the growth since 1900 has been ever more rapid, the colored population now exceeding 80,000."

In Indianapolis, Cincinnati, Philadelphia, New York, Boston and Chicago race feeling and discrimination are rapidly increasing; new and more difficult problems are constantly arising.

Two classes of colored people come North: "the worthless, ignorant, semicriminal sort," lured by the intermittent, high-paid day labor of the North and the glittering excitements of city life; and "the self-respecting, hard-working people who are really seeking better conditions of life, a better chance for their children." To many of these the North has all the glamour of the promised land. Coming North to find a place where he will be treated more like a man and less like a serf, the negro discovers that he must meet the competitive struggle to which men of the working class are subjected in the highly developed industrial system of the North.

I know of nothing more tragic than the condition of the swarming newer negro populations of Northern cities—the more tragic because the negro is so cheerful and patient about it all. I looked into the statistics closely in several of them, and in no instance does the birth-rate keep pace with the death-rate. They die off faster than they reproduce themselves, and if it were not for the immigration constantly rolling upward from the South the negro population in Northern cities would show a falling off. Consumption and the diseases of vice ravage their numbers. . . .

From inquiries that I have made everywhere in the North there would seem, indeed, to be a tendency to "race suicide" among negroes as among the old American white stock. Especially is this true among the better-class negroes. The ignorant negro in Southern agricultural districts is exceedingly prolific, but his Northern city brother has comparatively few children. . . .

Not only is the death-rate high in the North, but the negro is hampered by sickness to a much greater degree than white people. Hospital records in Philadelphia show an excess of negro patients over whites, according to population, of 125 per cent. About 5,000 negroes passed through the hospitals of Philadelphia last year, averaging a confinement of three weeks each. Mr. Warner, in American Charities, makes sickness the chief cause of poverty among colored people in New York, Boston, New Haven, and Baltimore. The percentage of sickness was twice or more as high as that of Germans, Irish, or white Americans.

Such are the pains of readjustment which the negroes are having to bear in the North.

Superficially, at least, the negro in Boston still enjoys the widest freedom; but after one gets down to real conditions he finds much complaint and alarm on the part of negroes over growing restrictions.

Boston exercises no discrimination on the street-cars, on railroads, or in theaters or other places of public gathering. The schools are absolutely free. A colored woman, Miss Maria Baldwin, is the principal of the Agassiz School, of Cambridge, attended by six hundred white children. I heard her spoken of in the highest terms by the white people. Eight negro teachers, chosen through the ordinary channels of competitive examination, teach in the public schools. There are negro policemen, negro firemen, negro office-holders—fully as many of them as the proportion of negro population in Boston would warrant. A negro has served as commander of a white post of the Grand Army. . . .

But with crowding new immigration, and incited by all the other causes I have mentioned, these conditions are rapidly changing.

A few years ago no hotel or restaurant in Boston refused negro guests; now several hotels, restaurants, and especially confectionery stores will not serve negroes, even the best of them. The discrimination is not made openly; but a negro who goes to such places is informed that there are no accommodations, or he is overlooked and otherwise slighted, so that he does not come again. A strong prejudice exists against renting flats and houses in many white neighborhoods to colored people. . . .

Even at Harvard, where the negro has always enjoyed exceptional opportunities, conditions are undergoing a marked change. A few years ago a large class of white students voluntarily chose a brilliant negro student, R. C. Bruce, as valedictorian. But last year a negro baseball player was the cause of so much discussion and embarrassment to the athletic association that there will probably never be another colored boy on the university teams. The line has already been drawn, indeed, in the medical department.

In fact, the more I see of conditions North and South, the more I see that human nature north of Mason and Dixon's line is not different from human nature south of the line.—Ray Baker, in American Magazine.

Most people flatter themselves that they can't be spoiled by flattery.

# Echoes from Everywhere

## FOREIGN.

### An Arbitration Treaty with France.

Last year, when the arbitration treaties, drawn up, by our State Department with France, Great Britain, Germany, Italy, Spain, Portugal, and Switzerland, were submitted to the Senate, that body amended them so as to require that a special treaty, to be ratified by the Senate, should be drawn up for each individual case which was to be arbitrated. The President refused to submit the treaties so amended to the various countries. Last week, however, Secretary Root informed the Senate Committee on Foreign Relations that he had written to each of the seven countries and all had assented to the change, and that the President would accept the amendment. The scope of the treaty is shown by the first article which reads:

Differences which may rise of a legal nature or relating to the interpretation of treaties existing between the two contracting parties and which it may not have been possible to settle by diplomacy, shall be referred to a permanent court of arbitration established at The Hague by the convention of July 29, 1899, provided, nevertheless, that they do not affect the vital interest, the independence or the honor of the two contracting States and do not concern the interest of third parties.

The treaty with France was ratified by the Senate on February 20, and will be in force for five years. The arbitration treaties with the other six countries are identical with the French treaty and will be ratified. The next duty of the State Department and the Senate is to draw up such treaty with Japan.

### Philippine Church Award.

During the Philippine insurrection the American Army used many churches, contiguous parish houses, school buildings and seminary buildings as hospitals, prisons or barracks, and after the restoration of peace the occupation of the buildings was, in many instances, continued until suitable quarters could be constructed for the garrisons. The great Cathedral at thousand captured Spanish soldiers. Many other of the Manila was used for the imprisonment of three or four buildings used were fine structures, and in some cases, were considerably damaged and sometimes partly destroyed during their occupancy by the American authorities. The Catholic Church submitted claims for \$2,442,000 on account of the Government's occupancy of these buildings, including in their demands compensation for damages inflicted by the insurgents. The Board on Church Claims appointed by the War Department, after a careful investigation, made a conservative award of \$363,000 to the church. The church likewise submitted claims for \$298,222.50 for the spoliation and carrying away of sacred ornaments, images, vestments, and so on. The Board of Claims made no awards in these cases, but suggested that if Congress desired to recognize such claims an allowance of \$40,000 would be ample. The Committee on Insular Claims has accordingly introduced into Congress a bill

to allow to the Roman Catholic Church \$403,000, the sum of the two awards, the money to be paid to the Archbishop of Manila, as representative and trustee of the Roman Catholic Church in the Philippines.

### Russia Too Poor to Build Fleet Destroyed by Japan.

Minister of Finance Kokovsoff, in an authoritative statement, said that he saw no possibility under the present circumstances of the country raising funds to rebuild the fleet destroyed by Japan.

The naval project had reached the point where the estimates, amounting to \$1,000,000,000 for ten years' construction, had been submitted by the admiralty to the financial committee of the Douma.

Minister Kokovsoff says that neither this extended program nor the alternative minor program, calling for an estimated expenditure of \$225,000,000, can be considered.

### The Pope and His Editors.

The interdiction of "modern" Catholic newspapers goes on merrily in France. The Archbishop of Rennes and the Bishop of Laval have laid their ban upon the abbé Dalry's paper, "La Vie Catholique," because he urges Catholics to vote with the Left in supporting the government. Printers have been forbidden to print this sheet. Other interdictions are less easy to understand. That zealous Catholic, Henri Laserre, the pious historian of Lourdes, lately found his "Translations of the Gospels," put under the ban. Applying to Rome for the changes required in order to obtain the information, he received a list of 5,548 necessary corrections in text and notes, and 4,500 suppressions of capital letters, commas and hyphens. Some of the textual corrections are merely in the order of the words.

The Kaiser has made himself laughed at all over the world by the frequency of the prosecutions for lèse majesté in his domains. But he was so grateful for the defeat of the Socialists last year that he ordered that the enforcement of the law should be less rigorous, that, for instance, persons who cast reflection on the imperial house while under the influence of drink, or otherwise mentally irresponsible, should not be prosecuted. The result is that in Prussia only fifty-three persons were convicted of the crime in 1907 as against one hundred and eleven the year before.

On account of his speech in New York, the Monarchist (Octobrist) and reactionary members of the Douma at first boycotted Professor Milyoukov. When he started to approach the tribune in order to speak, the members of these parties left the chamber. In their absence there was not a quorum and the president suspended the session for half an hour. When the session opened again, Professor Milyoukov again started to speak, and his opponents repeated their tactics. Later when the members

had found more accurately what Professor Milyoukov said in America, they concluded that he did not deserve criticism, and the total result is that he is stronger as a leader now than ever before.

"Things they do better abroad." Paris has inaugurated a special corps of bicycle policemen whose care is to oversee automobile traffic. The men carry three small flags, meaning, respectively, "Smoke," "Too fast," and "Smell," by which they warn automobilists who are unconsciously infringing on the municipal regulations. The French Automobile Club pays the expense of the corps. French automobilists must be more anxious to obey the law than certain of their American brothers.

A law compelling shops to close on Sunday recently went into effect in Italy. In Rome every shop obeyed the law. Domestic servants, who were not included in the law, are said to be complaining that they also should receive a day of rest. In the country districts, Sunday is the shopping day for the peasants, and at Albano and several other places the country folk assembled in front of the shops on the first Sunday under the new law and compelled them to open up.

Costa, one of the three men killed by the royal guards at the time of the assassination of King Carlos and his son, was an innocent bystander. The new king and his mother, two or three weeks after the assassination, summoned Costa's mother to court and promised to take care of her in the future.

The Russian police have arrested in St. Petersburg fifty men and women whom they accuse of being terrorists and of plotting against Grand Duke Nicholas Nicholaievitch and J. G. Chitchevlovitch, the minister of Justice. The Douma condemned terrorism in a resolution supported by the Constitutional Democrats as well as the Octobrists and Monarchists.

King Menelek, of Abyssinia, has sent Pope Pius a couple of lions. The Pope now has all the elements for an old-fashioned heresy trial and execution, the heretics in the shape of the Modernists and the executioners in the shape of lions.

## TEMPERANCE.

### A Prohibition Amendment to the Constitution.

Impressed with the growing popularity of Prohibition and feeling the pulse of the people in his own and other districts that are getting tired of Congressional delays, Congressman Acheson introduced on Monday, Feb. 24, the following Joint Resolution, proposing an amendment to the Constitution of the United States:

"Resolved by the Senate and House of Representatives of the United States of America in Congress assembled (two-thirds of each House concurring therein), that the following amendment to the Constitution be proposed to the legislatures of the several States, which, when ratified by three-fourths of said legislatures, shall become part of the Constitution, namely:

"The manufacture, sale and importation of intoxicating liquors, including beer, ale and wine, and of opium, cocaine or other narcotic drugs, except for medicinal and mechanical purposes, shall be prohibited in the United States and in all of the territory over which the United States has or shall have jurisdiction. Congress shall have power by appropriate legislation to enforce the provisions of this article."

A few thousand petitions to the Committee on Judiciary, to which it was referred, for the immediate consideration and favorable recommendation of this Resolution might help this committee to decide more favorably for the national prohibition of liquor. A two-cent stamp will tell them your wish.

### A Testimonial After Sixty Years of Temperance.

Liquor journals insist on saying that the people of Maine do not want the prohibition of the saloons in their state. The following is a fair sample of what a hundred leading papers in the State have just said. The papers were Republican, Democratic, Socialist, and farm journals. The people of Maine are pleased with prohibition and the contrary statements of the liquor press are falsehoods made to get votes for liquor in other States where the temperance sentiment is growing. Licensed saloons may bring more revenue into the city or county treasury, but they also, as surely, bring more paupers and criminals to our poor-houses and jails. The voters of Maine want no resubmission, no license, no free rum, but such enforcement as will strengthen manhood and promote individual prosperity and happiness.—Maine Farmer, Augusta.

## EDUCATIONAL.

### Training One Thousand Pupils.

The second annual report of the Massachusetts Commission on Industrial Education is filed.

The Commission is of the opinion that industrial education cannot be successfully connected with the elementary schools or with the high schools, which have as their main object a general education, because the efficiency of such a school depends chiefly on its dominant motive; it is also of the opinion that industrial training should not be attempted for young people under fourteen years of age.

The Commission has also prepared a plan for an industrial school for girls. This plan has been provisionally accepted.

The State of Massachusetts has been the first in the Union to undertake systematically the work of providing for its manufacturing interests of the future a body of workmen who shall be skilled not only in the practical but theoretical branches of their work.

### Educating Both Mind and Body.

A system of compulsory physical training for girls has been established in the central and technical high schools of Springfield, Mass.

The physical training is made a regular part of the school course and counts towards graduation, probably the only course yet discovered to compel interest in it in many of the pupils.

The object being to make well girls rather than gymnasts, and the system carried out with the idea constantly in mind, there is none of the danger which attends mere athletics, and the results of the experiment thus far are so plainly good that most of those who at first objected or doubted must be convinced.

## GENERAL.

The fleet was received at Callao, Peru, last week, with tremendous enthusiasm. The State Department has confirmed the report that the battleships are probably to return via Suez. Australia has invited the vessels to include the antipodes on the return trip. In a letter on the sub-

ject to the American Consul General at Melbourne, Prime Minister Deakin, of Australia, said: "No other federation in the world possesses so many features of likeness to that of the United States as does the Commonwealth of Australia, and I doubt whether any two peoples could be found who are in nearer touch with each other and are likely to benefit more by anything that tends to knit relations more closely. Australian ports and portals would be wide open to your ships and men, and it would be a matter of great gratification if the President could see his way to direct that the wishes of this Government be met in the matter." Secretary Root gives some hope that at least part of the fleet make the visit.

#### Congress to Investigate Slavery in the South.

Many severe charges and considerable evidence that southern business managers do import and hold in slavery European emigrants has led Congress to investigate the condition of affairs in half a dozen southern states. County attorneys have repeatedly called such cases into court but the grand jurors always failed to convict the guilty parties because they wanted this foreign labor force to be retained as it is. What the present investigation may reveal will be watched with interest. The South is not very well pleased with the action of Congress, but if slavery is practiced against the Constitution of the United States, it is time that the facts are found out, whether it hurts north or south.

#### The Death Penalty in the United States.

Many papers are referring to the penalty of death which a Russian court pronounced upon General Stoessel for surrendering Port Arthur to the Japanese seven years ago as an evidence of Russian cruelty and backwardness in civilized matters. The United States have just such a military statute and so have all the other leading countries, and General Hull would have suffered this penalty in 1812 had not his advanced age recommended clemency in the court. War ethics are about the same the world around.

#### 1,000 Tons of Coal a Day.

The above is the record of coal used on the big ocean steamers, Lusitania and the Mauretania. Each vessel is trying to maintain an average speed of 25 knots per hour.

The huge new Cunarder, the "Mauretania," last month made the eastward passage in five days, two hours, forty-five minutes, being at the average speed of 23.90 knots per hour. Between Tuesday noon and Wednesday noon she covered 575 knots, her average speed per hour being 24.87 knots. This constitutes a new record for ocean steaming. It must be understood that the eastward day's run amounts as nearly as possible to only twenty-three hours.

New Mexico is knocking at the door once more for statehood. According to George Curry, Governor of the Territory, President Roosevelt has pledged himself to do what he can to help. He is quoted as saying: "New Mexico and Arizona will be admitted as states inside of another year, if it is in my power to accomplish it."

Since the recent decision of the illegality of the boycott by labor unions, the unions are having a hard fight in some places because of their boycott system. In New Orleans a large number of unions are under indictment at present.

A good picture of how some corporations treat the laws of the land, and show their attitude toward their employés, is shown by the way the Northern Pacific Railroad is doing. The law recently compelled the railroads to give their telegraph operators a nine-hour day. The Northern Pacific in complying with the law now refuses to give their operators an hour off for dinner, thus forcing them to work as much as they did before the law was passed.

The Government certainly means to have the work on the Canal popular, if ingenuity and solicitude can make it so. Last week it sent off four young women musicians, a violinist, a soprano, a contralto and a pianist, to make a four weeks' concert tour of the Isthmus. The concerts will be given in the Young Men's Christian Association clubhouses at Colon, Panama, Empire and Culebra.

For ten years now the wreck of the Maine has been in the harbor of Havana. On February 15, the tenth anniversary of the sinking of the ship, the wreck was decorated with wreaths and a flag at half-mast. There is talk of removing the vessel as part of a plan of harbor improvement.

Congress advanced the scale of wages last week for all enlisted army men, both private and official. The army has been diminishing in numbers for several years past and its extinction is to be offset by paying wages which will compete with those offered in the commercial world.

Miss Ellen M. Stone, the Missionary who was captured by Bulgarian brigands in 1901, is reported to have asked Secretary Root to demand from Turkey the restoration of the \$66,000 which was paid for her ransom, in order that it may be returned to the persons in this country who contributed it.

The recent floods in the Ohio valley caused a loss of \$2,500,000. That sum would have built a few reservoirs in which to store and regulate all this waste water.

The Pullman car company has refused to serve liquors in its dining and buffet cars.

---

## WANT AND EXCHANGE

---

**WANTED.**—Some brother with experience to take stock in and manage a bank in a good small town. Address, J. M. Stutsman, Elbing, Kans.

**FOR SALE.**—Half section fine Canada land with good house and barn. 50 acres ready for crop. Will exchange for Albaugh-Dover Stock or farm near Chicago.—Willard, 921 So. Spaulding Ave., Chicago.

**WANTED.**—Brethren having surplus money on hand to buy large tracts of land, in the Imperial Valley, to subdivide for the Brethren Colony. I will insure good income on money so invested. Address, W. F. Gillett, Holtville, California.

**JANITOR.**—Good position, good pay. Work year around. Fine position for young man or for man with family ready for college.—Mount Morris College, Mount Morris, Illinois.

If you **SPRAY THIS SPRING**—and you'd better!—let me tell you about a compressed air sprayer, only \$7.50, which I have found by experience the best for orchard, garden, greenhouse work and whitewashing.—W. G. Nyce, St. Peters, Pa.

## NEFF'S CORNER

P. H. Beery, Traveling Colonization Agent of the Santa Fe Railroad, visited me some weeks ago. He has traveled extensively throughout the West and Southwest, but after he carefully looked over our town and surrounding country he declared with enthusiasm, "You have the best rental property and town lot proposition in the Southwest." This is the verdict of many others. The opinions of men who have traveled sufficiently to make intelligent comparisons are well worth considering. Don't you think so? I have several plans by which you can get in on a profitable Clovis investment, no matter where you live. If interested, address,

JAMES M. NEFF, Clovis, N. Mex.

## ONLY 10 COPIES

We have just 10 copies of Peloubet's Select Notes on Sunday School Lessons for 1908 that we will close out prepaid.

## Only 95c Per Copy

This is perhaps the best Commentary published. It contains nearly 400 pages and would be a great help to any teacher. Order a copy now if you want a copy at this special price.

Regular price, .....\$1.25  
The first 10 orders only, ....95c each

BRETHREN PUBLISHING HOUSE,  
Elgin, Ill.

## Matthew Henry Commentary on the Bible

Catalogue Price, \$15.00  
Our Special Price,

1. o. b. Elgin, Only

**\$7.95**

We have reduced the price of this commentary until it is within the reach of all. Every minister and Bible student who does not already have a set of these books ought to take advantage of this special offer. Better send your order at once.

BRETHREN PUBLISHING HOUSE  
Elgin, Illinois

## MAKE YOUR HORSE

**YOUR FRIEND** If he's a good horse he'll be better. If vicious or has bad habits all can be promptly and permanently cured by my system. Anyone can do it. Postal brings full information free. Write today.  
PROF. J. H. BEERY, Pleasant Hill, Ohio.

## EVERYBODY LIKES IT

You can get the genuine old-fashioned, pure HOME-MADE

## APPLE BUTTER

We make it a specialty. We have hundreds of well-pleased customers. You run no risks. We guarantee satisfaction and safe delivery. Write NOW.

C. J. MILLER & CO., Smithville, Ohio.

## WHITE PLYMOUTH ROCK EGGS

13 for \$1.25; 26 for \$2.00, carefully packed. The White Rocks have no superior as a general purpose fowl, are excellent layers, mature young for market. My fowls are bred right for vitality, size, color, etc.

I AM A GRADUATE IN VETERINARY MEDICINE and make a specialty of poultry diseases, prescribing by mail for thousands of cases every year. Poultry diseases are very much neglected by the average veterinarian, therefore, such information from a specialist is a rare opportunity. For 20 cents (silver) with complete description of the symptoms of the poultry ailment, I will write a special letter, giving the most scientific way of treating the disease described.

DR. H. H. LEHMAN, Ashland, Ohio.

WHIP STEALING STOPPED with Farver's Locking Whip Socket. Size and appearance like an ordinary socket, yet will securely lock any ordinary sized whip, when desired, by simply pushing it down in the socket. Unlocked with a key (two of which go with each socket). Durably made; lasts for years; easily attached to dash; guaranteed in every respect.

Price, \$1.50, sent prepaid.  
Wm. Farver & Co., Ashland, O.

## FREE SAMPLE

Send letter or postal for free SAMPLE HINDOO TOBACCO HABIT CURE. We cure you of chewing and smoking or 50c., or money back. Guaranteed perfectly harmless. Address Milford Drug Co., Milford, Indiana. We answer all letters.

## ESPERANTO

is rapidly gaining ground as an international language and now has thousands of enthusiastic supporters in almost every nation on both Hemispheres. We have therefore arranged a clubbing proposition with "Amerika Esperantisto" which is the most popular Monthly Magazine devoted to the propagation of the language.

### Here is Our Offer

The Inglenook one year, .....\$1.00  
"Amerika Esperantisto" one year  
and paper-bound copy of Esperanto Grammar, ..... 1.50

\$2.50

If you order both, at once, only \$1.25

BRETHREN PUBLISHING HOUSE,  
Elgin, Ill.

## RESULTS COUNT

That is why ANGEMA is becoming so popular.

Used as a Salve and as a Liniment.

ANGEMA keeps away croup.

ANGEMA prevents lung fever.

ANGEMA guards against COLD in the head or on the breast.

Have you tried it for your children?

Use ANGEMA and stop worrying.

Your life will be prolonged, your children healthier and all happier.

It relieves RHEUMATISM, NEURALGIA and HEADACHE.

Be our representative in your community. ANGEMA is good. Our proposition to our agents is better. One lady sold 96 tubes in one small town in a month and without much effort at that. People want ANGEMA when they see it. Judge for yourself. Send 15 cents for a full-sized 25 cent tube.

Write for particulars FREE.

THE ANGEMA LABORATORY  
GARRETT, PA.

If you SPRAY THIS SPRING—and you'd better!—let me tell you about a compressed air sprayer, only \$7.50, which I have found by experience the best for orchard, garden, greenhouse work and whitewashing.  
W. G. NYCE, - St. Peters, Pa.

## Thirteen Orders With Scarcely Any Effort

"I hereby enclose you an order for 13 of the new Revised Minutes. I have long wished that my members would get the book and become acquainted with what it requires of us. I believe it would be much easier to care for a church whose members are posted on Annual Meeting decisions, so I just took in hand and secured the order with scarcely any effort."—Eld. J. H. Baker, Astoria, Ill.

### EACH ELDER OR PASTOR

could help his congregation wonderfully along this line with just a little effort. Try it in your congregation as did the above Elder and the results may surprise you.

The new Revised Minutes contain all the revised minutes up to 1898 and the minutes since that date including the late meeting held at Los Angeles, Cal., last May.

The book is durably bound in cloth and contains over 300 pages.

## Bible History

By Rev. Alfred Edersheim, D. D.

Seven volumes, 12mo.

1. The World before the Flood and History of the Patriarchs.

2. The Exodus and Wanderings in the Wilderness.

3. Israel in Canaan under Joshua and the Judges.

4. Israel under Samuel, Saul and David to the birth of Solomon.

5. Israel and Judah from the birth of Solomon to the reign of Ahab.

6. Israel and Judah from Ahab to the Decline of the Two Kingdoms.

7. Israel and Judah from the Decline of the Two Kingdoms to the Assyrian and Babylonian

Captivity. Containing full Scripture references and subject indexes to the whole series.

Regular Price, per set, .....\$7.00

Our Price, per set of 7 volumes, f. o. b., Elgin,.... 3.50

Will send, express prepaid, for 75 cents extra.

## Mr. World and Miss Churchmember

By W. S. Harris.

It is a forcible allegory, somewhat after the style of Pilgrim's Progress, but in no sense an imitation of it. Fathers and mothers, it is the book that you should get for your son and daughter, and at the same time read it yourself. You will be stronger for the church after having read it. It illustrates vividly how Satan lures the church member, step by step, from the pure Gospel.

till finally he is lost forever. Send in your order at once and you will never regret it. Cloth only.

Our Price, Prepaid .....\$ .75

# ALBERTA

¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the colonies already there and enjoy some of the material benefits as well as help build up one of the largest and best colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

¶ For particulars and cheap rates apply to

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon Obtained the Present Year about \$1400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

# Clippings from the Siskiyou News

## ERICKSON & PETERSON.

### Their Great Contract on The California Northeastern Nearly Completed—More Work to North.

Dorris, February 7, 1908.

Editor Siskiyou News:

A delegation of farmers attended pay-day at the headquarters of Erickson & Peterson on the 25th of last January on matters pertaining to heavy sales of grain and hay by the producers to the railroad contractors. If the amount of these sales were expressed in figures they would not be small ones. Notwithstanding this, Erickson & Peterson have purchased all the produce of this valley offered for sale. The near approach of one of the finest railroads of the Pacific coast, if not the United States, has commenced to warm us into life. The channels of commerce are being widened, the pulse of trade quickened, and we feel that the hand of civilization is about to be laid upon us. The advent of the California & Northeastern railroad into Dorris is not an idle dream. With Bray as the present terminus, some twenty-six miles away, and miles and miles of ties and heavy rails and bridge steel on the ground, Mr. Hoey, chief engineer of the construction works, has given it to the writer that by the first of next May he will have the steel laid into Dorris. With the completion of the road to Dorris a great engineering feat will have been performed—miles of cuts through solid and unyielding rock, deep ravines filled to maintain the one per cent grade, every depression with an iron aqueduct for the outlet of imprisoned waters, every foundation of solid masonry, and every bridge of steel. Such is the California & Northeastern.

It is a matter of history that Napoleon crossed the Alps with a great army. It is a fact that Erickson & Peterson have crossed the great tributaries of old Shasta, burnt more powder, with a heavier equipment and used their steel for a better purpose than did Napoleon.

Let us say that this work has been maintained under most adverse circumstances. At a time when the great Harriman systems were trembling under the financial depression and every projected line of his shut down, Erickson and Peterson were pushing their work, aided only by their skill of twenty-seven years' experience. These people now are trimming up the roadbed across the broad expanse of plains some eighteen miles south of Dorris, when

their present contract will be completed. Just who will continue the work north is a matter of conjecture, but it will not be straining a conclusion to say that Erickson and Peterson, with their heavy equipment, railroad construction trains, steam shovels, pumping and electric plants, and thousands of other implements, costing perhaps a quarter of a million dollars, will be permitted to assume the responsibility of taking up the heavy work between Dorris and Klamath Falls. The new contract from Dorris will include the work of the big tunnel, a structure eighteen feet wide and twenty-four feet high, built on an easy curve and a descent of the conventional one per cent grade, emerging the better part of a mile from its entrance. This contract will be let on a basis of solid rock and an estimate of eighteen months to two years in process of construction. The big tunnel will be the door that admits you to the Hole-in-the-ground, where heavy grading continues around a precipitous mountain, then a tunnel 800 feet in length thence to the Big Klamath Marsh. With the heavy railroad work north of us it is safe to say that Dorris will be the center of gravity for some time—the hub of commerce and the paradise of pleasure.

C. T. Silvers.

### The California Northeastern.

There is renewed activity in railroad building beyond Bray, the present terminus of the California Northeastern.

Three big Southern Pacific engines are now at work bringing up large quantities of railroad supplies, the principal part of which is railroad ties, although six car loads of rails were brought in recently. There is sufficient material piled up now in the yards at Bray to complete the road to Dorris and additional supplies are being brought in daily. The heavy grade between Weed and Grass Lake makes the additional engines necessary to get the trains up the hill. Indications along the line point to the commencement of work on an extensive scale in the early spring, and the outlook is more favorable now than ever before for the early completion of the road to Klamath Falls.

The grade on the California Northeastern will be completed this month as far as Macdoel, so that it is likely that the steam shovels will be taken next month to Klamath Falls.

SAN FRANCISCO, CAL.

# Possibilities of IDAHO

---

## Unlimited

---

Many settlers are locating in the new tract near Twin Falls just now being opened for settlement. There are splendid opportunities for young and old of small means to get good comfortable homes with a splendid income.

### Grain, Alfalfa, Sugar Beets and Fruits

are among the products that yield abundantly. All we ask is a thorough investigation of the possibilities of this country. What others are doing you can do as well.

Visit the new BEET SUGAR FACTORY now in operation at NAMPA. Another factory will be built at Payette next year and undoubtedly others in this section of the country. Seeing is believing.

### Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th day of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Morrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty percent more plant producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where it is equaled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

### Realize \$1,000.00 Per Acre

#### Some Facts Are Hard to Believe

The following is one of them;

Orchardists in the Payette Valley are realizing as high as one thousand dollars per acre for their apple crop this year. Some of the finest apples in the world are grown in this section and command prices at from \$2.00 to \$3.00 per box.

#### Figure It Up for Yourself

50 trees on one acre. Apples are yielding this year from 6 to 15 boxes per tree.

50 trees would yield 500 boxes or more.

500 boxes at \$2.00.....\$1,000.

Come and see and believe.

### HOMESEEKERS' ROUND TRIP TICKETS

## Hero Sentinels of the Coast Lights

John S. Fernald

THAT "peace hath her victories no less renowned than war," is amply proven in the lives of those who "go down to the sea in ships," and those whose duty it is to safeguard, so far as possible, the lives of these heroic toilers and the vast amount of property entrusted to their care. The warrior, both on sea and land, is, in a sense, to use a modern phrase, in the limelight, and his acts are heralded in contemporary prints and recorded in history. But the worker in the arts of peace has no such fame. His acts of daring, of devotion to duty and of self-sacrifice, whether in facing the dangers of the stormy ocean, running the railroad train, or in any of the thousands of lines of modern industry, are barely noticed unless some startling event calls public attention to them, and then, after being a "nine-days' wonder," they are forgotten.

All civilized governments having territory bordering on a seacoast or navigable lakes maintain along those coasts systems of lights, buoys, beacons and other aids to navigation, while crews of life-savers, with life-boats and other appliances, keep constant watch to render succor to the shipwrecked mariner. On the Atlantic and Gulf coasts of the United States are 1,327 light stations, including 33 light vessels, while our government maintains 27 light stations in Cuba and Porto Rico. The light vessels are small craft, of not over one hundred tons measurement, anchored in the open ocean off the coast, and serving the purpose of lighthouses in locations where such structures could not be maintained.

One cannot realize what life is on these light vessels without actual experience. We think of the discomforts of an ordinary sea voyage on a well-equipped modern liner or palatial coastwise or lake steamer, measuring from one thousand to ten thousand tons, and have little idea of the daily toil, discomforts and dangers of the little crews of these guardians of the coast. The steady rolling and pitching of the vessel or steamer under way is as nothing compared with the irregular roll, the furious pitching and the vicious

snubbing on the chains, as these little vessels are buffeted by the waves. Being anchored on or near the edge of shoals, the sea is much rougher than in the usual courses in the deeper waters of the open ocean, and yet, with his vessel tossing and heaving in the sea, as no other craft can, the light-ship man must at-

tend to his duties faithfully. His lamps must be kept trimmed and burning constantly from sunset to sunrise, and his day mark must be substituted during the hours of daylight. In many of these light-vessels a record must be kept of passing craft, and, now that wireless telegraphy has been installed, must be reported. In foggy weather a siren, or other loud-voiced horn must be sounded at regular intervals, usually two blasts every minute, the duration of the blasts to be ever the same that the passing mariner may know, from the signal, what station he is near. Let those who object to the sound of these fog signals,

when heard for a brief period, the hearer being comfortably ensconced in a seaside hotel or on board a passing yacht, think of the men in the stations obliged to hear the sounds at close range constantly, and under conditions of the greatest discomfort and danger,

and also let them realize that on these very sounds the lives of thousands of sailors and passengers and millions of dollars' worth of property depend. These signals are made by machinery over which the men must keep constant watch, and if anything goes wrong, then the great bell must be sounded by hand. On the light-vessels and lighthouse "eternal vigilance is the price of safety," not only of the men themselves, but of many others.

Lighthouses are of many kinds, each being built according to the needs in its locality. The greater part are in places of comparative safety, on the land, and are wooden or stone towers, with ample buildings for the keeper and his family, but all are more or less isolated from neighbors, as the light must be as near the shore as possible, and is often on some headland, far from any other buildings. But the keeper whose life is the most isolated and filled with danger is he who keeps the light standing alone on a ledge in the open ocean, with perhaps not a foot of the solid rock showing above the water. Some of these towers are built of granite, and stand in water of considerable depth, others stand on bare rocks, of which but little shows above the surface, and others still, on account of the great force of wind and waves, must be built of open-work steel. In these outside lighthouses life is even more dreary and dangerous than on the light vessels. There are the same duties as to keeping the lights and fog signals that prevail on the vessels, but the motion of the ship is absent, only the fearful beating of the waves against the structure, making it rock and tremble to its foundation, with the ever-present danger that the whole may be washed into the sea. When a light-ship breaks away from her moorings she is helplessly adrift, but is nearly always picked up by some revenue vessel or other craft, and brought to safety, while in case of disaster to a lighthouse the inmates all perish before help can possibly arrive. This has occurred at Eddystone, off the coast of England, Minot's Ledge off Boston harbor, and others.

Among the light-vessels most frequently mentioned

in the marine news of the papers are Frying Pan Shoals Light-vessel, which is moored in sixty feet of water seventeen miles off Cape Clear, North Carolina; Winter Quarter, nine miles off the coast of Virginia; Fire Island, Sandy Hook and Scotland Light-ships, which guide the mariner to New York from the south; Nantucket Light-vessel, forty miles off the eastern entrance of Long Island Sound; and the two Pollock Rip light-vessels, one and one-half and four miles off the coast of Cape Cod, Mass.

Among the most important and at the same time the most dangerous of the light-stations of the United States, are the series of lights along the Florida Keys. These Keys consist of a dangerous reef a few miles off the coast extending from the Fowey Rocks on the Atlantic about two hundred miles southwesterly to Dry Tortugas in the Gulf of Mexico. These lights consist of the Fowey Rocks, Carysfort Reef, Alligator Reef, Sombrero Key, American Shoal, Sand Key, and Dry Tortugas. Except the latter, which is a lighthouse built on the land, these are open-work steel structures, standing from one hundred to one hundred forty feet in height, in the open ocean, with no land or projecting rocks near, but guarding a channel filled with all sorts of obstructions, in crooks, turns, rocks and shoals. Standing as they do alone in the open ocean, and feeling the full force of the gales of both the Atlantic and the Gulf, life in these places is anything but a pastime.

Not the least among the disadvantages of the life of the light-keeper is the lack of educational facilities for his children, not one light-station in twenty being

located within reach of the public schools. A movement is now before Congress, however, to provide some means of education for these children.

While we would take no jot or tittle from the honor due to him who offers his life in the defense of his country, nor him who faces the dangers of the sea to transport our people and merchandise to and from home or foreign ports, nor to him who, with his hand on throttle and lever, controls the locomotive as it flies over its course with its cargo of human freight, we would not forget those who with no human companionship outside of their own mates, guard the lives and property of the traffic of the seas. Confined in one spot, the light-keeper sees no human life except the passing craft, and these are at so great a distance

that communication can only be of the briefest possible kind by means of signal flags, and confined to technical reports, weather, etc. He cannot visit or receive visits except under the most favorable weather conditions, and he must be constantly on guard night and day for fear that the failure of some part of his apparatus to work properly may lure some vessel with its precious living freight to destruction. Again we say, that while all honor is due to the man behind the gun, the man behind the light is entitled to the name of hero along with the bravest of the brave.

#### ALPHABET OF AMERICAN AUTHORS.

G. FEGLEY.

##### X. "H. H." Jackson.

"HELEN, daughter of Professor Fiske, was born in Massachusetts in 1831. While she was a bright child, and grew to be an amiable woman, it was years before she turned to literature. She married Mayor Hunt, an able naval engineer, and devoted her time to her son and husband, and any spare time was given to society. Mayor Hunt was killed while experimenting with one of his own submarine inventions. Soon after her son and only child died, and then Mrs. Hunt to ease her heart-ache and loneliness turned to the muse, and in the course of time published an unpretentious book of "Verses." Then she took a trip to Europe, and on account of the grace and humor of her delightful letters, by the advice of a friend, published them as "Bits of Travel." Several other volumes followed. It is claimed that she wrote the two novels, "Hetty's Strange History," and "Mercy Philbrick's Choice," although she never acknowledged them.

Diphtheria drove her from Newport to Colorado, where she married Mr. Jackson and became greatly interested in the cause of the Indians. "From 1880 to 1885, the year of her death, her heart, mind, and pen were devoted to this one subject." The United States Government appointed her to examine into the needs of the California Indians, from the interest manifested by the public in her book, "A Century of Dishonor," dealing with the attitude of the government toward the Indians. Then came "Ramona," a story making an appeal to the red people, which aided much in bringing juster treatment of them. Her pen-name by which she is known was "H. H."

She wrote some stories for children, "Nelly's Silver Mine," and tales of "Cats." Her life was full of labor for others, of helpful good, yet the last lines she ever wrote are humble:

"Father, I scarcely dare to pray,  
Too clear I see, now it is done,  
That I have wasted half my day  
And left my work but just begun."

Worthy of mention: Thomas Jefferson, political;

Henry James, stories and criticisms; Sarah O. Jewett, novels; R. M. Johnston, stories; John Jay, political; Mrs. Emily Judson, poems and sketches.

Bryan, Ohio.

#### THE SENSITIVE PLANT.

A. G. CROSSWHITE.

FROM early childhood I had heard of the deadly "Upas tree" and had even believed the fabulous reports that the very atmosphere around it was poisonous; but not until I was full grown did an opportunity present itself of coming in touch with a plant which I regarded as more marvelous than the fabled plant of the East.

Strolling along the east shore of the beautiful Tennessee River with a friend one day, he stopped abruptly and pointed to a certain singular plant. Said he, "Did you ever see anything like that before?"

"No," I replied, "I think not. It resembles the lotus a little, but its vine is more like a certain species of river apricot that grows in the mountains of upper East Tennessee."

"No, it is neither," said he. "You may recognize it possibly by touching it." I cautiously put out my finger expecting either to be stung or slightly poisoned, for I had had some serious trouble with the poison oak and had maintained a vigorous hatred toward it or anything of a similar nature. But the effect, in this instance, was in no way injurious to me, yet I will never forget to my dying day my great surprise to see it shrink from my touch and wither to its very roots.

"Shame on me for inflicting such pain upon her maidenly little form without a thought of injury," said I, apologetically.

My friends who had know the plant for years told me it was the "Sensitive Plant" and then took a hearty laugh at my expense. I offered no further apologies for my ignorance of plant life either to the marvelous little "River Queen" or to my friend, who declared that I actually blushed when she so visibly resented my familiarity.

This plant, though exceedingly rare, is well known to the botanist but is a failure as a house plant. It must be allowed to grow in its native soil quite unmolested by human hands; for there is no affinity between them. A personal contact with it, however, is by no means fatal to the over-modest little plant for it soon straightens up again and retains perfect composure until some rude hand molests it again. Mr. Brander who is recognized authority, describes it as follows: "A plant of the genus *mimosa*, so called because its leaves and foot stalks shrink, contract and fall on being slightly touched."

This would form the nucleus of a fine illustrative article if we had the talent or disposition to moralize,

but our object is, primarily, to open up an avenue of scientific investigation.

### THE ORIGIN OF WARS.

RICHARD SEIDEL.

There was tumult and there was din;  
There was Satan, and there was sin;  
There were groanings, and there were fears;  
Orphans' sighs, and widows' tears;  
And there was cursing and piercing cry,  
And despair's last rending agony;  
And there were vultures, and worse than they,  
Hovering to gorge their human prey.  
Where were such sights, I pray thee tell?  
Where was on earth so fierce a hell?  
There, where yon warriors armed and steel'd,  
Are cheering their troops to the battlefield;  
There, where famed statesmen and poets, I ween,  
Declare 'tis a proud, a glorious scene.  
But was there found, in that brilliant day,  
The heart to feel or the lip to pray?  
The accents of heaven or the looks of love,  
The Prince of Peace, or the Holy Dove?  
I say not what passes in secret souls,  
For dewdrops may fall while thunder rolls;  
But I saw them not in the haggard cheek,  
I heard them not in the dying shriek;  
I marked them not in the frenzied eye;  
They calmed not the shouts of victory!  
They were lost in the yells of the frantic breath,  
That peal'd to the heavens for triumph or death!  
They echoed not in the cannon's roar!  
I traced them not in the seas of gore.

### WHICH IS THE ROAD TO BIGSVILLE?

O. H. KIMMEL.

YEARS ago, when our great Northwest was only sparsely settled, a New England family was making the long weary trip to the new Northwest. They had reached a pioneer town in Minnesota only a few miles from the new town of their determined destination. This town we shall call Bigsville. The traveler drew up in front of a cabin at the outskirts of the former town, and inquired of the kindly-faced ranchman who was mending a harrow by the roadside, which road he should take to Bigsville. The kindly-faced rancher pointed out the road that the traveler should take, then they entered into conversation.

In the course of the conversation the traveler asked concerning the kind of people that lived in Bigsville and thereabouts. This question the rancher did not answer directly. He first asked the traveler what kind of a place he had left back in New England.

"I left,"—said the traveler,—“just one of the meanest communities that any one ever lived in. The people were untruthful and mean, and stingy and almost wholly given to lying. They were backbiters, and would say and do all manner of evil

against any man or his family. Their morals were not good, in fact, I can call to memory no good trait of the people of the community from which I came. It was because of this that I packed my family and a few goods into this wagon and emigrated to the West. I hope, here, to find good people and a good community where my family may grow and wax strong and fat from the abundance of this new, rich soil. I presume that Bigsville will be a good place for me, don't you?"

"I cannot say that it will be," said the rancher, meditatively. "You see Bigsville is settled largely by people from New England, and I rather think that you will get out of Bigsville just what you did out of your community back in New England."

"But," said the traveler, "I have heard, all along the way, that Bigsville is an ideal place, made up of good people and good associations."

"I can't help what you have heard," said the rancher, "nor do I desire to discourage you. I bid you go to Bigsville and try it. But remember what I tell you, I think you will get out of Bigsville just about what you did out of your New England home."

With this the traveler drove on towards his destination.

The next day another traveler and his family stopped in front of the rancher's door, and he too inquired the road to Bigsville. Then as usual, they entered into conversation and in the course of the talk the traveler inquired about the new town of Bigsville. Again the rancher evaded the question and inquired about the community that the traveler had left.

He said, "We left the best little neighborhood back in the New England hills that any man could ever wish to see, or to live in. The people were all so kind, and so good that it was hard for us to break away from them. They were intelligent, enterprising, true-hearted, charitable and public spirited. No true man ever asks a favor in vain in that community. I tell you it was hard to leave it, but in doing so I am sure we shall succeed, for the prayers of every neighbor we had back there are with us. We wanted to come west to give our children a better chance in the world, for there we were thickly crowded together. Of course, we do not expect Bigsville will be as good as our old home, but if it is even half as good we can get along."

"Well," said the rancher slyly, "Bigsville will not disappoint you. It is made up of good, enterprising, hardworking people, and they will suit you, and you will suit them. With the exception of my own town, I think it is the best place to live that I know of. Whatever you put into a community, you get from it. If you put the same goodness and kindness and charity and love in Bigsville that you put into your New England home, you will find that the town will re-

spond just as generously as that town did. Remember that what you put into a community you will reap from the community."

With this encouraging remark the traveler thanked the rancher, and drove away, leaving the philosophic old rancher to himself and his thoughts.

Two years later the old rancher happened to be in Bigsville one day. While he was on the streets he chanced to meet the first traveler of our description. After greetings the ex-traveler stated to the rancher, "Well, you were true in what you told me about Bigsville all right. The people are just as mean here as they were in New England."

"O I knew that, I knew that," said the rancher, "I told you then that you would get out of Bigsville just what you got out of your New England home."

Just as the rancher had climbed into his rig, preparatory to starting home, he noticed some one hallooing at him from across the square. He waited until the man came up, and it turned out to be traveler number two. They greeted each other cordially, and then the new settler said, "I have long desired to meet you and to tell you how happy myself and family felt after our talk with you at your home that day when we were coming to Bigsville for the first time. We have found it to be a most delightful place. The people are just as good and kind and charitable as they were in New England. Every family here, but one, has visited us, and we have repaid the visit. We are all neighbors and friends and associates. This is a delightful place to live."

"Yes, yes, I knew it," said the rancher, "I told you then that what you put into a community you will reap from it. Yes, it is a good community, a good community." And with this he drove off toward his home mentally assuring himself that he knew the one family that had not visited the second traveler.

### COLUMBUS SCRUGGS.

N. R. BAKER.

THIS Columbus never sailed upon the great seas tho his ancestors did. He was a big, hulking negro. He had a propensity common to many of his race of taking what did not belong to him, but not the usual capacity for avoiding detection.

On this occasion the charge was grand larceny and the sentence was ninety days at hard labor. That meant transportation to a logging camp and labor with other convicts under a lease contract made with the owner of a great sawmill fifty miles from Mobile. This mill cut 75,000 feet of lumber daily and besides the fifty or more convicts employed one hundred free laborers.

One night Columbus disappeared from the strong and high stockade, altho a warden with a shotgun was constantly pacing the distance around it. He

walked eight miles, stole a suit of clothes, was captured and returned.

Punished? Laid across a barrel and whipped with a heavy strap.

Again he disappeared. Again the same punishment in double portion. He was shackled and warned that the next offense would merit a punishment close to the point of fatality. The third night he disappeared again. Again the capture and the return. Preparations were made for the great flogging. The strap was brought forth. It was thick as a buggy trace, twice as wide and almost as long. The negro was stripped, and laid across the barrel. It was a hot July day. The warden, clad in trousers and undershirt only, laid on one hundred lashes with both hands, using all the power at his physical command. When thru the warden, exhausted, sank upon a log with streams of perspiration dripping from every pore. The giant negro had neither moved, trembled nor winced. Calmly he arose, cast a pitying glance at the warden and said, "I declare, boss, it's a shame for a white man to haf to work like dat on sich a hot day."

But such irreverence and disregard for authority must be dealt with yet more severely. Explanation is made to the "big boss" of the mill. He comes in person, a giant himself, and tells Columbus that for the next offense the bloodhounds, hitherto used in tracking him, will not be called off at the critical moment, but will be allowed to tear him to pieces. A special guard is appointed to watch him night and day. Before the end of another week, in broad daylight and under the eye of the special guard, while stacking lumber, with heavy shackles joining foot and arm, Columbus disappears as suddenly and as effectually as if the ground had opened and swallowed him. He had only piled the lumber so that he could hide in his own lumber pile, but the guard thought he must have run. Phone and wire messages were sent to other camps and neighboring towns. A large reward for his capture was offered. The next morning the shackles were found on the back porch of the "big boss," the owner and superintendent of the mill. A file taken from a tool chest in his back yard had been used to remove the shackles.

Such impertinence—and such grim humor. Then there was "racing and chasing"—on Gallberry Flats. Of course the threats as to the dogs must be carried out. But should Breakwater be loosed? That was the question. Breakwater was the largest and fiercest of the bloodhounds, a regular man-eater. Yes, the die is cast. Breakwater is to lead the pack. The superintendent of the mill, mounted on a superb black horse, follows the baying hounds.

All day they travel, fifteen miles from home. The trail leads down to Escatawpa River and is lost. After a time the dogs swim the river and find the trail on the farther bank. The horse and rider dare not cross.

but two miles further down the trail is lost again. After a time it is found, now on this side. This is repeated four times. Floundering over logs, thru marshes and swamp, back and forth across the river, now losing, now finding the trail, the weary day drags on.

At sundown a hungry and disgusted rider sits a jaded steed. The baying of the hounds is heard far away across the swiftly-flowing stream and interminable swamp. What is there now to do but leave the negro to his fate? Undoubtedly the hounds will overtake him soon and tear him to pieces. The rider turns his horse's head homeward where he arrives at midnight by a shorter route.

The next morning at sunrise a careless, shambling negro approaches a forest home far beyond the river and offers in exchange for breakfast four meek hounds, and Breakwater is the meekest of the lot.

Two years later this negro died of fever in a coal mine where the convicts were then working. He had stolen something of such value that his sentence was for two years, and such long terms are served among the dusky diamonds instead of in the lumber camps.

*Mobile, Ala.*

## ESPERANTO, THE INTERNATIONAL LANGUAGE.

### Its Practical Uses. How it has Spread Over the Entire World.

It is hardly necessary in these days of extensive international intercourse in the fields of commerce, science, literature, and travel to discuss the need of an international language. The world of scholars, and popular sentiment is demanding today as never before that there be a neutral language to unite the minds and activities of men in these various fields of national interest, spare to specialists the labor of years of study in the acquirement of foreign tongues, and make our international congresses something more than a "Babel of confused tongues."

No one of the national languages could hope to be selected as the international medium of expression, for the reason that international jealousy would prevent its adoption. We often hear people asserting that English is to be the language of the whole world; but the unfortunate thing is that the people who make this statement are always Englishmen, and never Frenchmen or Germans! Even were it not for this international jealousy, English spelling would prevent its adoption; and by the time that our ridiculous spelling is reformed, Esperanto will have been used as the International auxiliary language for many, perhaps hundreds of years! The only solution of the problem then is an artificial language, built upon the two thousand vocables which are homophonic in ten great languages; these roots to be phonetized according to simple, international principles of pro-

nunciation, and grammaticized with a minimum of inflection; the language must not be difficult to learn and must be capable of expressing the finest shades of thought.

It is a well-known fact that many words are already international, as "automobile," "theater," "bicycle," etc.; these words remain practically unchanged in Esperanto. The rest of the words are taken from various languages, preference always being given to those words that are found in the greatest number of the national languages. Thus "hundo" is from the German, "blanka" is French, "pano" is Spanish, "pordo" is Italian, "patro" is Latin, "kaj" is Greek, "akompani" is English, etc. In this way one who knows Esperanto becomes acquainted with these other languages of which it is composed. Esperanto is absolutely phonetic, each letter having one unchangeable sound. Its grammar is simple and there are no exceptions or irregular verbs. Nouns end in "o," adjectives in "a," adverbs in "e," etc. The significant thing, the thing we desire to call your attention to, is not the beauty or perfection of the language itself—for many things that are perfectly sound in theory do not work out in practice—but how universally Esperanto has been accepted all over the world. This is the thing that counts. For no matter how imperfect the language may be in itself, and how impossible it may be according to the judgments of some men to invent an artificial language that will adequately express men's thoughts, if people all over the world have determined to make it a success, and are actually using it every day for all kinds of practical purposes, Esperanto cannot fail.

How can one say that Esperanto is a Utopian dream and will never come into practical use, when it has spread to Algeria, Australia, Austria, Hungary, Bulgaria, Bohemia, Norway, Samos, Chili, Indo-China, Denmark, French Guiana, Holland, Canada, Malta, Mexico, Monaco, New Zealand, Tunis, Uruguay, Brazil, Roumania, Greece, China, South Africa, Madagascar, Bolivia, Poland, India, Japan, Peru, Russia, Belgium, Sweden, Switzerland, Spain, Italy, Germany, France, England and the United States? Do not think that we have named the countries where merely individual Esperantists live; in every one of these countries regular Esperanto organizations for the propagation of the language exist, while in many of them it is taught in the Universities, Commercial Schools, and public schools.

Japan has awakened to the possibilities of coming into touch with western thought and culture through Esperanto by placing courses of study in its universities, and giving it official support. So great was the demand for courses of study in the language that it was necessary to found an Esperanto Institute at Tokio. In Russia, in spite of the difficulties encountered because of political disturbances, it has worked its way

into the principal universities, and many societies have been formed for the propagation of the language. In Belgium the Minister of Public Instruction announces his intention of introducing it into the public schools. Switzerland, the seat of the Esperanto Congress last summer, is thoroughly awake; Geneva is the headquarters of the International Scientific Association using Esperanto in its international relations. In Italy Esperanto prospers under the peculiar blessing of the Pope; It is even used at the meetings of the Cardinals. In fact the whole Catholic world is beginning to be interested in the language since the founding of an international Catholic review printed in Esperanto. In Germany courses in the language are offered by several universities, while such world-famed professors as Ostwald and Schmidt have lately lectured on the subject and urged its introduction into the public schools. Frankfurt is the seat of the International Commercial Association which uses Esperanto in its international relations.

But France is the stronghold of Esperanto today, and Paris is the greatest Esperanto city in the world, having a select Esperanto club of four thousand members. Thus any Esperantist, be he a German, Englishman, Japanese, or Pole, is always at home in Paris, and the tourist in France today can be understood with Esperanto, since it has worked its way into all of the principal cities and large numbers of the great hotels. Scholars, scientists, professors support it; Berthelot, Brouhard, General Sebert and many other members of the French Institute are Esperanto enthusiasts; already it has become an obligatory study in many of the public schools, and the Chamber of Deputies is now considering the matter of introducing it into all of the schools.

But England is not far behind; the London Chamber of Commerce has put Esperanto upon the same footing as French and Spanish, gives examinations and grants degrees of proficiency in the language. The largest commercial schools and many of the Universities offer regular courses of study. The London County Council has lately authorized the teaching of the language in the public schools, and hundreds of teachers are hastily preparing themselves to teach the language. These are remarkable victories for Esperanto in England, when one considers that it has all been accomplished since 1904. Cambridge, England, was the seat of the third Esperanto Congress, held in August, 1907.

#### ANARCHY TAUGHT BY MAIL.

THE Catholic church is deeply stirred over the murder of Priest H. Heinrichs, of Denver, Colo., a few weeks ago, by an anarchist. Scores of other priests and prelates have been threatened and terrorized by a band of anarchists lately organized. Archbishop Inigley, of Chicago, has summed up the situation by

charging the *Chicago American*, a leading daily paper, with teaching and spreading this reign of lawlessness. It will be remembered how this paper foretold the murder of McKinley and justified the murder afterwards. This event is evidence that the paper named has some connection with the reign of anarchy which is spreading so rapidly in this country.

Here are its words:

"McKinley, bar one girthy Princeton person who came to be no more or less than a living, breathing crime in breeches, is therefore the most despised and hated creature on this hemisphere. His name is hooted, his figure burned in effigy—

The bullet that pierced Goebel's chest  
Cannot be found in all the West;  
Good reason it is speeding here  
To stretch McKinley on his bier.

"Institutions, like men, will last until they die. If bad institutions and bad men can be got rid of only by killing, then killing must be done.

"There has been much assassination in the world, from the assassination of some old rulers who needed assassination to the assassination of men in England who, driven to steal by hunger, were caught and hanged most legally."

Free speech is a republican institution, but when that free speech binds shackles upon the public, like anarchy is doing all over the world, it is time that governments make an attempt to suppress such abused liberties, and, while they attempt to suppress the publication of corrupt political doctrine, it would do well to also suppress the immoral virus which also fills the daily papers today in the way of coarse, profane pictures, scandal and lewd talk. If corrupt literature was taken away it would purify not only the civil life, but the political conditions of affairs also.

#### ELK EATING ORCHARDS IN NEW HAMPSHIRE.

THE depredations of a herd of elk, protected by the law and said to be the only extensive herd of these animals at liberty east of the Rocky Mountains, have aroused great anxiety among the farmers of Andover and surrounding towns, who apparently have no legal means of protecting their property. Already damage amounting to several hundreds of dollars has been done to orchards in the vicinity of Ragged Mountain, over which the elk are roaming. The state fish and game commissioners have inspected the territory and noted the evidence of damage, but have expressed the opinion that the farmers can obtain no relief under the present laws. The only way of securing payment for property loss caused by the animals, they say, will be to secure the passage of special acts by the next legislature, the next session of which will open in January next. Meanwhile, all that the farmers can do is to try to frighten the animals away from their orchards.

The elk, originally numbering eight cows and four bulls, were formerly confined in Corbin park, in Croyden, N. H. Austin Corbin, head of the association which controls the park, presented them to the state to be turned loose in some wild territory. At the request of officials of the Ragged Mountain Fish and Game Club the game commissioners placed the elk on their property, located on Ragged mountain in Andover. This property is not enclosed, and it was agreed that the animals be allowed to roam at will. For the first three or four years they were seen occasionally, but did not appear to be increasing in number. Last year, however, owners of farms near the mountain were surprised to see a large number of the animals who descended into their fields, cropped the grass and vegetables and ate the new mown hay. In the fall they grew still bolder, and began to molest the trees. This winter between forty and fifty elk have been counted at one time, and they have become so fearless that they have invaded farms in the center of the town. Hundreds of valuable young apple trees have been damaged and many have been ruined.

#### A NEW INDUSTRY.

A BANGOR paper is authority for the following pig story:

Because the guests at a dinner given in Boston by Garrett Schenck, the millionaire president of the Great Northern Paper Co., pronounced the ham and bacon and roast from a hog killed in the Maine woods to be the best eating they had ever tasted in the pork line it is likely that the raising of wild pork on a large scale will be attempted by Mr. Schenck as a side line to the making of paper. Indeed there is more than a likelihood of it for already an order for one hundred shoats has been given to a well-known marketman and these shoats will be turned loose on an island in a northern Maine lake as soon as the snow is off the ground and the air warm enough for piggie's comfort.

#### GOAT MILK A TUBERCULOSIS PREVENTIVE.

NOTHING in the history of science is more instructive, according to the experts who prepared the recent report of the British commission on tuberculosis, than the vast difficulties experienced in propagating the use of the milk of the goat. Physicians of the highest eminence have affirmed that, in the milk of the goat, nature provides the best possible solution of the problem of tuberculosis. In saying that the goat is not subject to tuberculosis, Dr. Finley Bell, of the New York Academy of Medicine is in agreement with Sir William Broadbent. He also supported by the evidence of leading English goat keepers and of every publication concerning goats, and of the distinguished Prof. Nocard who stated recently that of the 130,000 goats and kids brought to Paris for slaughter every spring,

the meat inspectors had failed to find a single case of tuberculosis. Nevertheless, with the exception of the member of the British aristocracy, few Anglo-Saxons have profited by the lessons of these truths. Those scientists who go so far as to defy any authority to produce a single case of tuberculosis among a population using goat's milk to the exclusion of cow's milk, receive little attention. The circumstance seems all the more surprising in view of what the investigators on the British commission call the superior richness and flavor of the milk of the goat to that of the cow.

The above has been under discussion for some time and is worthy attention. Goats seem to have a good record for healthiness and some scientists have declared that the cow has been the medium through which tuberculosis has been spread, although other scientists have denied this claim. For good or evil, goat milk is coming into use more and more because goats can be kept in the cities where cows cannot be kept.

#### H. M. BARWICK IN SCHOOL.

EDWARD FRANTZ.

I HAD met Bro. Barwick first in Chicago about fifteen years ago, but had no real acquaintance with him until he came here to school. He came here from Canada in November, 1903, attended the college that year and the following one, graduating with the A. B. degree with the class of 1905. He was chiefly interested in philosophical subjects. He did considerable work also in the Bible department. He was a strong student. When he met a new problem he would hardly do anything else, even eat or sleep, until he had thought it through to his own satisfaction. He had not much patience with small details, but had great ability to grasp the main issue and get at once at the heart of a subject. He became greatly interested in foreign missions while here, and I think seriously considered the idea of entering the foreign field, even at his own expense.

The two years following his graduation were spent chiefly in evangelistic work. In this work he was very successful, many being brought into the church during his meetings. A part of this time he was in the employ of the mission board of Southwestern Kansas, being stationed first at Heizer, Kansas, afterward at Newton, Kans. It was from the latter place that he went to Elgin to become editor of the INGLENOOK.

He was a man of earnest spirit, and of more than average ability. Why he should have been stricken down in the prime of his manhood, why he could not be spared to accomplish the work which his physical, mental, and spiritual strength seemed to promise—this is one of the mysteries that baffle our finite minds.

McPherson, Kans.

## CURRENT COMMENTS

### THE FUTURE OF PERSIA.

For a quarter of a century England and Russia have been operating in Persia—Russia in the north, and England in the south and along the coast. For a long time each nation was held in check by the fear of the other, but last fall they came together and agreed not to molest each other in the furtherance of their projects so long as each one kept within his own territory. This virtually made Persia the prey of a concerted attack from both nations.

The artist gives a graphic portrayal of the past and present condition of affairs. Russia is importing more soldiers into the north and is extending her grip very rapidly, while England is not slow to pick up any stray straws that might strengthen her position in the south. Persia bids fair to become prominent in European politics before long.

### OUR SCHOOL SYSTEM.

Education in this country is the bulwark of national progress. The Revolutionary fathers provided school laws and a school system on a liberal basis. States have set aside lands for a perpetual school fund. Legislatures appropriate millions every year for our public schools, to say nothing of the hundreds of church and private schools.

With all of this school enthusiasm we seem to be awakening to the fact that the contents, or the matter taught in our school system, is not as helpful as it should be in reaching the desired end—good citizenship. The medium (a free school system) is admirable, but the goods which are delivered do not seem to be giving the best of satisfaction. The first concerted confession which came from the educators themselves was in the resolutions passed last summer, by the National Educational Association, in which the character of the student of today was deplored by the educators.

Since that time, and even before, various college professors have ventured to speak their convictions. High school teachers have discarded Greek letter fraternities and sorosis clubs from many schools. Universities have remodeled some of their courses of study leading to the higher degrees. President Wilson, of Princeton, speaks his feeling thus:

"I have been teaching for some twenty years—that is, I have been conducting classroom exercises—but I do not think I have been teaching any appreciable part of that time. I have been delivering lectures, sometimes about

things of which I know, but more often about things of which I had heard. My pupils have remembered my stories and forgotten my lectures."

Domestic Science and industrial schools are springing up in every direction and a general awakening is evident everywhere. The day of calling a mass of disputable facts "knowledge," and "education," is past in this country. The old term "preparing for college" will soon be substituted by "preparing for life," for what does not fit one for life should not be considered a fitness for college. Nor does this mean that everything is to consist of bread and butter studies, but practical life is to receive a larger share of attention than ever before. Art, literature, ethics and science will all be bent to beautify life in action as well as to beautify canvas for studies.

When this stage is reached we will all find that the highest art, the deepest science, and the most valuable information, is that **which can be and is converted into everyday conduct.**

"By their deeds ye shall know them" is applicable to educated people just the same as it is to Christians. When this test fails then there is something wrong.

### KANSAS NEWSPAPERS ON WHISKY.

There are over 800 newspapers in Kansas but only twenty of them publish whisky advertisements.

Before and After the Anglo-Russo Treaty.

### PRUSSIA AND POLAND.

The strike a year or two ago of the Polish school children in the eastern provinces of Prussia against reciting their religious exercises in German was but a picturesque feature of a long race conflict. Prussia is attempting to Germanize these eastern provinces. Since 1886 the government has been buying lands from Polish owners and reselling them on favorable terms to German immigrants. The policy has induced Polish competition in land buying. Poles have established land banks to assist their fellows in buying land from German owners. The net result has been that Poles hold more land in these provinces than they did twenty years ago. During the

ten years from 1896 to 1906 the Germans lost to the Poles on the whole 125,000 acres, equal to one per cent of the area of the two provinces. Since 1898, the Prussian Land Commission has had to buy almost solely from German proprietors. In view of this fact Chancellor Bülow has got the Prussian Diet to pass a law providing, under certain circumstances, for compulsory expropriation of land in the provinces of Posen and West Prussia. The public sentiment of Europe condemned such a high-handed proceeding. Sien-Rieroic, the great Polish novelist, made an appeal to the civilized world to exert its influence to prevent the passage of such a measure, but, though it was sharply fought, Bülow whipped it through. Under it 173,000 acres are liable to forced purchase.

### JAPAN AND AMERICA.

Baron Takahira, the new Ambassador from Japan, took occasion to say, in a carefully prepared interview on the day of his arrival, that war between America and Japan was impossible, that the attitude of the Japanese toward the Pacific cruise was shown by their desire that it might visit Japan on its way home, and characterized war talk as "smoke without fire" and "commercial news," that is, he explained, "news spread for certain objects to conserve some special interest of the newspapers." The reception of the new ambassador by the President, with whom he is personally acquainted through his residence as minister here during the Russo-Japanese war, was most cordial. It is announced that the Japanese Government has given our Ambassador O'Brien an outline of the measures they will take to limit immigration. They are reported already to have prohibited the issuance of passports to Japanese laborers to go to Hawaii. In the month of January, 1908, only 970 Japanese came into continental United States and Hawaii, as against about five thousand last year, figures which Secretary Strauss interprets as showing that Japanese restrictive measures have been effective. Baron Takahira will have to deal with a second big question now pending; that is, the treatment of American trade in Manchuria. It is freely charged by our merchants that Japan is attempting to close the door opened for the world's trade into Manchuria through the action of the late Secretary Hay. The situation is summarized thus: Exclusive privileges have been granted Japanese merchants and foreign merchants have been forbidden to enter Manchuria to solicit trade. China is developing an antipathy to Japan. The training of the Chinese army by Japanese officers has ceased. Japan has abandoned her adherence to the program for the preservation of China's integrity. In regard to railroads in Manchuria, the Japanese have forced the Chinese to drop their plan for opening a new road, alleging that it paralleled their own railroad there, though the two roads would have been as far apart as the Pennsylvania and the New York Central. Americans have complained of a system of rebates on the South Manchurian Railroad, the Japanese Government line by which Japanese have been favored.

### MORE NEWS FROM MARS.

Photographs of the spectra of Mars as compared with photographs of the spectra of the moon, made by Professor Slipher at the Lowell Observatory at Flagstaff, Arizona, show on repeated plates that the "Little A" band is stronger on Mars than on the moon, a fact which, according to Professor Lowell, indicates that there is water vapor in the atmosphere of the planet.

### THE GREAT WAVE OF PROHIBITION.

The American people are loathing the liquor traffic. The better element are endeavoring to trample the whiskey evil under their feet forever. Every argument in favor of the so-called right to make and sell intoxicants, goes down in the face of the facts of the terrible effects of drink. No sane man can consistently defend the liquor business from the standpoint of morals; nor yet from the basis of economics, since the loss to the people in property, in morals, in health as well as in actual cash, is far in excess of the tainted revenue the Government derives from the manufacture and sale of all intoxicants. Whiskey brings large returns to liquor dealers, because it fires the passions and holds its victims through the creation of an insatiable thirst. An army of Americans is annually wrecked in every sense of the term through the drink demon, whose activity is productive of insanity, vice, and crime. It is said that the new year began with 40,000,000 American people under the banner of prohibition, and that the wave of prohibition is destined to sweep the traffic from the nation. Every good citizen should commend every effort made to abolish the giant evil. The Federal Government should at once pass vigorous measures to sustain the will of the people in prohibition States, to the end that ultimately the Federal power may be employed to declare unreservedly for national prohibition.

### MONEY-MAD WALL STREET.

It has been said that a really square man in public life should have no enemies. But the history of all great men from time immemorial refutes the statement. No man who has ever dared to take a resolute stand against a deep-seated evil, has been free from the bitter opposition of the evil elements he denounced. President Roosevelt has taken a stand against predatory wealth; and today he is the most hated man in New York. Wall Street has gone beyond the limits of sanity in opposing the President. Wall Street is money mad. Goldphobia is rampant, contagious, and contaminating. It is unreasoning, and utterly oblivious to the sentiment of the nation. Wall Street hates Mr. Roosevelt; and the more bitter the hatred, the more popular the man becomes in other parts of the nation. What Wall Street hates bitterly, the people should heartily support, for Wall Street is corrupt and dangerous to all free institutions and subversive of good government.

### THE HUDSON TUNNEL.

Last week the swift electric train began to displace Robert Fulton's century-old invention as the shuttle which is weaving Manhattan and northern New Jersey into one continuous city. The first of the Hudson tunnels connecting Nineteenth Street and Sixth Avenue with Hoboken, was opened to public traffic. President Roosevelt's puissant finger touched an electric button in Washington to start the first train on which Governor Hughes and Foit were fellow-passengers. Already the subway tunnel under the East River to Brooklyn, which was opened January 9, has made subaqueous travel a daily commonplace to tens of thousands of New Yorkers, and soon the down-town tubes of the Hudson Company, and the Pennsylvania Railway tunnels under the North and East rivers will make the incomparable waterfront view of Manhattan only a memory, except to such as go down to the sea in ships.

It is said that an insurance company which took Alexander of Servia as a risk, put down his occupation thus: "King, hazardous." The occupation of king is hazardous. The Shah of Persia last week would have been killed by a bomb had it not been for special precautions. As the royal procession was traversing a narrow street in Teheran on February 28, two bombs were hurled at the royal automobile. The vehicle was shattered, the chauffeur wounded and three outriders killed. The Shah, however, was riding in a carriage further back in the procession. The automobile was closed, however, so that the fact was not known. More trouble in Persia is expected.

The London Missionary Society is preparing a great missionary exhibition to be called "The Orient in London," which will be held next June. Ten thousand volunteer helpers, "stewards" in the English phrase, recruited from the ranks of the Congregational churches, are being trained in London and the counties to take charge of the exhibition. "The Orient in London" is only one of the measures in a great missionary campaign that the directors of the London Missionary Society are undertaking this year to increase knowledge and interest about missions. Two other large exhibitions are to be held at Newcastle and at Bradford; two summer schools, or holiday conferences, will be held during the four weeks of August; for two months in the fall a preaching campaign throughout the country will be conducted by Congregational ministers, going out "two and two;" and then will follow a "simultaneous missionary mission," from November 15 to 22, in which, the leaders hope, every Congregational church in Great Britain and in the Colonies will share.

The English Winston Churchill, of the present Liberal Cabinet, in addressing the League of Young Liberals not long ago said some things in regard to the poor which we might well put in our hats to think about . . . "The greatest problem of the British Empire lies at home . . . Civilization, which has brought, and science which gives, many fair things to a large proportion of the population, has given nothing to the poorest and weakest among us. The condition of these is much worse from the point of view of the degree of human misery than the condition of the savages of the countries I have recently visited, or of the fierce, barbarous peoples of times long past. How can we talk of the virtue of thrift to a man who does not know whether he will get his next meal by a job at the docks or by pawning some pieces of furniture from his home? What is the use of teaching Imperialism—a very good thing in itself—to the man whose whole life is demoralized by the vicious and cursed element of casual labor which presses upon him from day to day? If I interpret the feeling of the working classes the cry is a great cry of complaint against insecurity in the lower ranks." The Master of us all is recorded to have cured the impotent man before he bade him sin no more.

Press dispatches suggest a stormy future for Portugal. A good share of the trouble comes from the extravagance of the court, which has to be supported by a country almost bankrupt. Seven royal palaces, the Necessidades, the royal city residence, Ajunda, the palace of the Queen Dowager, Relem, Quedes and Cascaes on the seashore, and the wonderful palaces of Cintra and Tena, besides the shooting places at Villa Vicosa and elsewhere, are

kept up with all the expenses involved in the constant journeyings of the large court from one place to another. The court itself has a hierarchy and a ceremonial etiquette second only to those of Russia and Austria, and the personnel is considerably larger than that of Germany.

The Republic of Panama is old enough to be thinking of electing its second president. The election of a second president is as hard for a republic as teething time for a child. We weathered it, but it was too much for Cuba. President Amador, abiding by the constitution, will not run for re-election. One of the two candidates who have thus far come forward is Senor Domingo de Obaldia, who has been minister from Panama to this country. He was the last Columbian governor of Panama, but after the revolution accepted the status quo. The other candidate is Senor Ricardo Arias one of the founders of the Panama Republic and a member of a family settled on the Isthmus in Balboa's time. Panama has thus far set an example of soberness to her neighbors to the North, altho she should not be given too much credit for it. It is said that at one time, within a year or two, a revolution was all ready to be launched, when word came from Washington that no revolution would be allowed. The big stick swished and Panama remained orderly.

#### BAD PROSPECTS IN THE NEAR EAST.

The concert of the Powers, in their relations to Turkey, is again "out of tune." The measures to reform conditions in Macedonia and remove the abuses which have been incident to the rule of a Moslem government over a Christian population having thus far proved ineffective, the Powers were preparing to formulate further proposals of reform, when the German Ambassador to the Sublime Porte, Baron Marshall von Bieberstein, announced that Germany would no longer act with the other Powers in insisting that Turkey consent to their demands; in other words, that Germany was willing to accept the Turkish reform measures, which would mean no reform at all. The German action has made more difficult a situation already complex on account of international rivalries over railroad concessions in the Balkan States and in Turkey. Austria wishes to build a road through Novibazar to connect the Austrian line through Bosnia with the Turkish line at Salonika. Russia has given word that it will not permit this extension, because it would give the commercial interests of Austria and consequently of Germany a practical monopoly of Western Turkey from the Danube to the sea. Austria desires direct railroad communication between Vienna, Salonika and Athens. From Vienna south, Austria already has her own lines through Hungary, Bosnia and Herzegovina down to a point on the Uoac River in Herzegovina. Coming north the railroad line runs from Salonika through Uskub into Servia, with a branch going from Uskub to the northeast as far as Mitrovitza. Austria desires to connect these north and south lines to complete the System. Russia, as a counter proposition, is said to be about to ask the Sultan for a concession to construct a railroad line from Raduievatz, in Servia, on the Danube River, to Antioari or Duloigno, both seaports of Montenegro, on the Adriatic, a project that would connect the Danube with the Adriatic and would practically make the Austrian project impossible. In the new alignment of the Powers on the Eastern question, Germany and Austria seem likely to be arraigned against Russia, Great Britain, France, and probably Italy.

# THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## HENRY MILTON BARWICK.

It is not within the power of the writer to give a fair representation of the many elements entering into the character of the subject of this sketch. It is to be doubted whether even a life companion could do that, giving to each influence its just value as it emanated from that character. The proper execution of such a task may be left to the One who knows the hearts of us all, who not only understands every impulse at its inception, but measures correctly the force of its every influence. Nevertheless, it is true that as we move among our fellows there emanates from us an influence that may be considered a fair index to the general trend of our lives. And this was true of our brother. With his strong convictions and his courage to stand by them, his life has left indelible impressions upon those who came in touch with him. We shall leave it to those who have made somewhat of a study of his character to discuss this subject and confine ourselves to the setting down of some of the facts in his life history.

Henry Milton Barwick was born in Dayton, Ohio, Jan. 28, 1870, and fell asleep in Jesus at his home in Elgin, Ill., March 7, 1908. He was the son of James E. and Rebecca Barwick. His father answered to the Master's call in 1876, and two brothers and a sister died in their childhood. His own son, little Paul aged fourteen months, preceded him nearly five years. He is survived by his aged mother, beloved wife, four children, two brothers, J. F. (merchant), of Hockley, Texas, and Dr. S. O., of Elkhart, Ind.

His ancestors have resided in this country since 1652 to 1664 and have ever been a worthy, upright people, the two leading professions among the Barwicks being the ministry and medicine. From childhood until his thirty-third year his home was in Preble County, Ohio, having been raised on a farm there.

From early childhood he was of a sympathetic temperament, free from rude or unbecoming conduct, or

the association of evil companions. From his first day in public school he was most studious and began teaching at the age of sixteen. He graduated from the academic department of Mt. Morris College, Mt. Morris, Ill., when twenty-three years old, also from the collegiate department of McPherson College, McPherson, Kans., in 1905. There was no time in his life when he was not engaged in study, in storing up knowledge and broadening out in higher thought. He was a free and easy thinker and writer, and his manner of delivery was such as to impress the hearer with his broad grasp of the subject and the earnestness of his purpose.

He united with the Brethren church at the age of sixteen and was faithful and devoted to his chosen spiritual belief the rest of his life. He was called to the ministry at the age of nineteen and at once entered into active church work. He was always held in high esteem by the young people as well as by the aged, and frequently officiated at marriages and funerals.

The Inglenook Room as Brother Barwick Left It.

His aim was not the acquirement of earthly goods, such as that of gaining and storing up wealth, but he was possessed of a mind and a desire for a high type of thought to be given in service for the Master. His life's work was not always executed under the greatest financial convenience, but with a fixed resolution he struggled to develop his natural mind qualities.

In physical form Brother Barwick was very nearly a perfect specimen of manhood. He was six feet four

inches tall, with a body well proportioned for that height, and at the time of his decease, gave no evidence of the hold disease had upon him. Saturday morning, March 7, he was at the office and about his regular duties. Evidently, however, he was not as well as usual, as he went home early. His noncommittal answer of "Nothing" to the inquiry as to his early appearance there removed the cause for anxiety that might otherwise have been felt, and his retiring to the bedroom with the explanation that he would lie down awhile occasioned no alarm, as he sometimes rested thus before the noonday meal. It was the rule to let him rest till he wakened of his own accord, but this time, after waiting a half hour, his wife went in to call him to dinner. But he was not there. Only the lifeless form remained. The physicians who were summoned said that he had been dead an hour and that he had died of heart trouble. Tuesday afternoon, after services in the Brethren church, across the street from his home, his body was laid away in the Bluff City cemetery, of this city.

Brother Barwick took active charge of the editorial work of the INGLENOOK last September. He began the work under many difficulties, but he brought to bear upon it the same zeal and energy and breadth of thought that has characterized all his efforts and it was coming to assume somewhat of the nature and character of his ideal. For this and other reasons it is hard for us to reconcile ourselves to his sudden departure.

But the life in the body is not all of life, and it must be that he could continue his work with greater glory to the One whom he served, freed from the vestments of mortal life. So be it.

"There is no death! what seems so is transition;  
This life of mortal breath  
Is but the suburb of the life elysian  
Whose portals we call death."

#### DELIVERING THE GOODS AS PROMISED.

WHEN the little INGLENOOK prospectus, for 1908, was sent out four months ago, some people wondered a little about our ability to deliver the goods advertised in the prospectus. The prospectus seemed to contain too much for one dollar. Well, if our correspondence is any criterion to judge from, there is not much doubt left about the goods being delivered.

The Editor wants to announce that not only has his own high anticipation been met, but it has been more than realized. In addition to twenty letters from foreign countries covering travel, missions and social questions we have such writers of national fame as Anthony Comstock, of New York City, for thirty years the leading figure in ferreting out foul literature. He has secured more legislation against evil books and caused more attention to be given to clean literature than any known living man. His name is

known over Europe and America. His article will soon appear. The American Humane Society, of Boston, Mass., has contributed an article. The National Red Cross Society gave a write-up recently. Then Mrs. Grannis, another person whose field of work has been the English-speaking world, will contribute four articles. Wilbur F. Crafts, of international fame in reform matters, has promised a letter. Prof. Corson, a national educator, has also a good article in our hands on "How the Home can Help the School." Mr. Day. M. P., of England, is preparing an article. It is useless to try to name all that are worthy of mention, but the above names ought to command attention and create enthusiasm for our magazine that would double its circulation within the next six months. If you appreciate our efforts, then please push the work along. Don't keep quiet about it.

#### ROASTING CHILDREN ALIVE.

IMMEDIATELY after the burning of the school building in Cleveland, Ohio, recently, in which over 170 children were roasted alive, in full sight of plenty of help, Governor Harris ordered an investigation. What there is left to investigate is hard to discover, unless it would be to investigate his state legislature and see why plenty of fire-escapes are not placed on all buildings in the State, that are over one story high. It is only two months ago that over 200 persons lost their lives in a fire in Pennsylvania. The Iroquois fire, in Chicago, with its 400 victims is not very far removed yet either, besides dozens of other buildings each year in which from one to twelve persons have perished. The recklessness of American people stands out boldly in this one aspect of failing to provide safety escapes for people huddled together in public buildings.

Coal mines, blast furnaces, railroads and fires consume tens of thousands of our worthy citizens each year, because of neglect. Of course not all mortalities could be avoided, but the number could be diminished by two-thirds or more.

Every reader of this item ought to urge his state congressman to offer a bill to his legislature which would compel fire-escapes to be placed on all buildings more than one story high. Many states have had such laws for several years and all the others will get them sooner or later, because it is right and reasonable. But there will have to be a few more thousand of our innocent ones burned up before our wise legislators can be made to let loose of old rotten partyism and do something for the people.

Later:—Since writing the above quite a number of cities have provided fire-escapes to their school buildings. It is the old story of locking the door after the horse is stolen.

## A Touch of the Real

Mary I. Senseman

MIRIAM lounged in the armchair, her eyes dreamy, listless, heavy-lidded.

Edna bent over a square of linen on which she was embroidering an elaborate design.

The elder sister worked very leisurely. Scarcely noticeable was the progress in the elegant work.

Miriam spoke now and then:

"If Cora Marley comes Sunday, we must have winter radishes. She likes them. Will that be finished before mamma's birthday? You are terribly slow. Your letter to Mr. Carleton cost double postage. I hope Mr. Carleton will send me some post cards. What ails mother? Her letter was as dull as she was when she left for Aunt Christine's. I wish Fergus were nearer our ages. He doesn't seem like a brother. Papa has a new hat. I am going up town," she finished, rising slowly.

Edna looked up at last.

"If you are not gone more than an hour, bring me a sable brush from Heckendorn's. Then I can work upon 'Twilight' today. I want to finish it before Mr. Carleton comes home."

"I'm just going to The Sweet Home for a dozen cornucopias and maybe—"

Edna interrupted, "We have a fresh nut cake for dinner. Papa and Fergus don't care for cornucopias."

"Well, I do," Miriam drawled. "And so does Gip."

Edna replied with a smile of elder sisterly indulgence.

Gip, the yellow and white collie, bounded joyously along at the side of his young mistress on the way to the artists' supply store.

For Edna Groveland was an artist. Not a far-famed one. She was only seventeen years old. And nobody but Mr. Carleton had ever instructed her. But Mr. Carleton's paintings were known in many a grand exhibit. And he said, of all his pupils, Edna's work was best; it was full of promise; she had the genius of patience, by which she created harmonious, simple-appearing pictures out of multiple perfection.

Miriam bought the sable brush and then she and her dog retraced a part of their way.

On a building alongside the confectionery, the girl noticed a sign that had not attracted her attention when she passed previously. The sign was, "Dolls' Hospital and Dispensary," and in the window were not only dolls and dolls, but a card reading, "Wanted! Two Girls at Once."

Miriam stopped. Next door were the rich cornucopias. Her pulses were bounding. It was a cold day, and her hands trembled as she tied Edna's packet fast to Gip's collar.

"Go home," she whispered to the dog.

Gip stood still, wagging his tail.

"Go home," repeated his mistress, aloud, but weakly. Then louder, sharply, almost angrily, "Gip—go—home."

The dog trotted away, his tail drooping.

The counter excitement of effort had quieted her nerves, and Miriam entered the "Hospital."

There were a young woman and a girl inside. Each sat at a table on which there were glue, thread, a box of sawdust, and quantities of dolls' accessories and of their every part or section.

The woman arose.

"Do you wish to see me?" she asked.

"Yes," replied Miriam, "if you are the one who wants two girls."

The young woman bowed.

"You want girls to work here?" questioned Miriam.

"Yes," was the answer, hesitatingly, as the speaker surveyed Miriam's clothes.

"Then I shall stay," was the assured statement. She picked up an armless doll, selected a pair of arms of similar proportions and composition and with needle and thread deftly fastened the new members in place.

"Please take off your wraps and sit at this table, Miss —."

"Miriam Groveland," supplied the girl.

"Miss Groveland. I can pay my assistants seventy-five cents a day." The tone was insistent now.

Miriam did not heed. She was deciding in her mind whether a black-haired or a fair-haired head would look the better on that doll body in the pink dress.

Miss Granvil took the card from the window and changed the second word to "One." She brought another table and supplied it as were the other two.

The door opened and a little girl entered timidly.

"Your dolly?" suggested Miss Granvil.

"Nanny," said the child.

"She's sitting up," said Miss Granvil, going to a small chair in which sat a handsome doll. "You may take her with you."

The child clutched Nanny, not forgetting to exchange a piece of silver for her.

For a half hour the three in the room worked uninterruptedly.

Miss Granvil was curious about her new helper, who had begun work so earnestly and was continuing it so absorbedly. But she silently planned to pay the girl her wages that evening and subsequently make inquiries concerning her.

Miriam was, in fact, wholly absorbed by what she was doing. She had not even noticed the dolls' cots ranged along one side of the room. So, when she had repaired all the dolls on her table, Miss Granville directed her to the cots, whence a new supply of invalids could be obtained.

Miriam was again settled at the table when the door opened and opened and continued to open. And Miss Granvil was walking about, and then the first assistant left her table, and then Miriam's aid was requested. For the hospital seemed to have filled all at once, with children and dolls. There were probably ten little girls from various grades of life who had brought their afflicted darlings or who were to receive theirs in renewed health.

Two or three, however, were newcomers who had not brought dolls. Poorly clad little ones they were. One of these drew Miriam's attention, saying, "A dolly, kin I git a dolly?"

Miriam, misunderstanding, asked the child to tell her what kind of a doll it was.

"Like that," was the answer, with an eager nod at a fine one near.

Miriam would have given it to the little girl, not preceiving that the shabbily clothed girl could not consistently own the dainty doll.

Miss Granvil opportunely interfered and explained. "Here is a dolly for you, sweetheart," she said. "We make these dolls from remnants of those brought in," she added to Miriam, "and give them to children who want them and who have none."

That was the dispensing branch, then, of the establishment.

At six o'clock the hospital was closed for the day.

Miriam, still in a glow, entered the confectionery and laid her newly-received quarter before a clerk.

"Cornucopias," she said.

She was soon at home, and took Gip with her into the vestibule, where she fed him the cakes, one by one.

It had occurred to her that she would have to explain her absence, and she dared hardly expect to be permitted to keep on working for Miss Granvil. She was not intellectual, but she was able to contrast her seventy-five cent position with the vocations of the other Grovelands. The father, owner and editor of a high-class magazine; his brilliant son, twice Miriam's age, Mr. Groveland's right-hand man; Edna, who was looked upon as an artist in embryo, and—mother, wife of Mr. Groveland and mistress of his home.

Mrs. Groveland was away. Miriam expected a scolding and a plain command to quit her nonsense. She couldn't plan a fictitious tale. She was not sharp-witted enough. Maybe,—it was chilly in the vestibule,—maybe she would be sent to school,—to a school for backward children. It had been only through hard pleading on her part, supplemented by Mrs. Groveland's requests, that Miriam was not in school this year. She had been a freshman in the high school two years, and then had again failed to be promoted. Mr. Groveland saw it would be useless for his youngest child to apply herself for the third time to the prescribed studies, and he offered her the choice of several selected schools. But entreaty won, and Miriam was spending the winter in idleness and aimlessness, except for Gip and an appetite.

The door opened, and Miriam hastily tried to escape. But there was also a swish of skirts on the stairs, and Edna's restraining voice, "Miriam! wait!"

Mr. Groveland stopped, too, then, and his elder daughter continued, with her manner of responsibility, "Papa, do you know where Miriam was this afternoon?"

"No," was the answer.

"She went up town about two, Gip with her, and before three the dog was at home, alone, with a sable brush, for me, tied to his collar."

"Where were you, Miriam?" Mr. Groveland asked the younger girl.

"I was at Miss Granvil's," she answered, and the memory of the dolls gave her courage to step toward her father and her dignified sister. "She has a dolls' hospital and dispensary and she wanted two more girls to help repair dolls and I went in and—worked."

"Well, Miriam!" it was Edna.

"Well, Miriam!" it was Mr. Groveland.

"Do you get paid?" questioned Mr. Groveland.

"Oh!" Miriam had her father by both sleeves and mildly jerked him. "Oh! you must not say you won't let me go just because I'm paid seventy-five cents a day. It's so splendid and children come in!"

"Well, Miriam,"—it was an emphatic "well" this time, and not a drawn-out one,—"it may not harm you. I shall consider the matter."

"Thank you," Miriam answered, and was silent as they went, three abreast, up the stairway.

It was Fergus who, a few minutes after, turned Gip out of doors.

A week had gone by.

That first evening Miss Granvil ascertained, of the proprietor of The Sweet Home, that Miriam Groveland was a daughter of David Groveland of *The Monthly*.

The following morning, Miriam put in an appearance at the hospital at nine o'clock. Her employer was already at work and the next morning Miriam came at eight. Again business seemed to have been in progress for some time, and the second assistant asked at what hour she should come.

"My sister and I begin work at seven," replied Miss Granvil.

That day a third girl became a helper in the hospital and the card was removed from the window.

Mrs. Groveland returned the last evening of Miriam's first week in employ. She did not seem to have been improved by the "rest." Mr. Groveland brought her from the train, but he told her nothing about their younger daughter except, "Miriam has a surprise for you."

It was a surprise—to the rest of the family as well. For, mother at home, Miriam could talk. She told the whole story of the week, its beginning and its triumphant progress, and Mr. Groveland, Fergus and Edna, with mother listened. This half-stupid, aimless, careless girl had all at once become alive, warm-hearted, gentle.

Mr. Groveland, the keen-minded, was thinking, and he told his thoughts to his wife, later, when they were alone. "Miriam has awakened, I think. I am glad she found the place. She has something tangible now, a pulsating connection with life. It will, in all probability, open a wider door for her. It is, at least, a touch of the real."

Then something seemed to snap in his brain and he gave a startled look at his wife.

He lay awake that night a long time. Thirty-two years arose out of the dead past and moved in solemn, almost tragic, state, before his mental eye. He saw his bride, a happy seamstress, come to grace his humble cottage. The son was born; then, in one bound, came recognition of the editor's talent, wealth, and an upward leap in the social scale, followed by new environment, travel, entertainment, a large and successful enterprise.

Some way, some place, Mrs. Groveland had dropped her needle. Not even when the daughters were born, two years apart, was any of their clothing made by the mother. And, as she ceased to ply her needle and thread, some of her joyous hold on life had ebbed. Mr. Groveland never properly accounted for his wife's seeming lack of interest. He knew tonight, when he said, "A touch of the real."

He looked into his own life. What would it be

without his beloved duties? Many hours a day were occupied with what, though often wearisome, was, to him, inspiring. And he, unwittingly, had driven from his wife's hands the one thing that meant as much to her as his work meant to him.

The next morning Fergus temporarily occupied his father's place in the editor's sanctum. Mr. Groveland was fingering many sorts of fabrics in a dry-goods store. Before noon he was transporting homeward a bundle nearly half as large as his own portly figure.

He lugged it into the house and Mrs. Groveland came in haste, alarmed. Mr. Groveland removed the wrappings. There seemed to be all colors of the rainbow and all textures within. "I never knew till last night, Lottie, that you had lost your grasp upon the real. And I am to blame for it. So I got these things. You can make anything,—dresses, bedclothes, table linen."

Mrs. Groveland suppressed the tears. There had been thirty years of famine!

"Thank you, David, now I can rest."

*Pleasant Hill, Ohio.*

#### WORK TOGETHER.

JOHN H. NOWLAN.

A raindrop on its downward way  
Across the sky was fleeting  
And to its neighbor, bright and gay,  
It gave a friendly greeting.

"Come, you help me and I'll help you,  
And each will help our brother.  
We'll show the world what we can do  
By helping one another.

"On fertile plain of waving grain  
We'll pour our crystal treasure.  
To do the good we know we should  
Will ever be our pleasure.

We'll turn the wheel to grind the meal  
The miller's bairnies feeding.  
We'll bear the freight of steamers great  
Across the ocean speeding."

Aye, do the little that you can,  
Aye, give your best endeavor  
To fill your place in heaven's plan  
And shirk your duty never.

What you can do may seem to you  
To be the veriest trifle;  
But keep in view the good and true  
And evil motives stifle.

Mulberry Grove, Ill.

I WONDER if many housekeepers know that boiling sugar with an acid changes the sugar to glucose. One pound of sugar has as much sweetening power as two and one-half pounds of glucose, consequently one pound of sugar stirred into fruit after it is cooked and while still warm will make the fruit as sweet as two and a quarter pounds when the fruit is boiling.—Sel.

## B - U - D - D - I - N - G

John H. Nowlan

THERE are several styles of budding, but the one described here is the most common one in use.

Budding is economical in the amount of wood from which the buds are taken, as a scion long enough for grafting will furnish several buds.

It is expensive in the use of stocks, as a seedling is required for each tree, while in grafting with the piece-root system two or more stocks can be made from a single seedling.

The operation is simple and an expert can do the

enough to take some of the new wood, and is cut straight across above the bud.

The stock should be at least as large as an ordinary lead pencil. Apples will require two years to reach this size, while peaches may reach it in a single season. Peach stocks may therefore be budded late in the first season of growth.

The height at which the bud is to be inserted depends upon the operator, but the nearer the ground the better. Where the body is cut off above the bud a crook is left which, if near the ground may be covered when the tree is reset.

Cutting off the top.

Cutting the bud.

Preparing the stock.

work quite rapidly. As a man can make more buds than grafts, the expense is not much, if any, greater than grafting, for the greater amount of work done offsets the higher price of summer labor.

Budding is done in the summer while the bark separates easily from the wood. The bud should be taken from wood of the present season's growth. The petiole of the leaf may be left attached to the bud to aid in placing it in position.

The bud is cut from below upwards, just deep

The cut for the bud, which should be made on the north side of the tree is made like the letter T. The cross cut of the T is usually cut a little sloping and the stem extends downward an inch or more. The two flaps of bark thus made are loosened slightly with the heel of the budding knife, the bud, grasped by the stem of the leaf, placed within the flaps and pushed down till the entire cut surface is in contact with the wood of the stock. It is then bound above and below the buds till the parts unite.

For this purpose use material affected as little as possible by moisture. Bands of raffia are much used for this purpose as are sometimes corn husks. Papaw bark was used by horticulturists here in former days, but now it is almost a thing of the past.

As soon as the parts have united, the bands should be cut, otherwise they will bind the bark too tightly. The following

spring the top should be cut off just above the bud.

By budding, the removal of the top forces all the strength of the root into the top, causing a vigorous growth, which is greater than in grafted stocks as the growth of the roots has not been checked.

In several climates care should be taken to select

Tying.

Inserting the bud.

hardy seedlings, as the bud can be no hardier than its root.

With a piece-root grafted tree the scion produces roots of its own and is the same as a tree propagated from a cutting.

*Mulberry Grove, Ill.*

#### GROWING FLOWERS.

##### March Preparations for Summer Blooms.

There's a stir in the bush,  
There's a song in the air,  
And birdies come back  
To the trees brown and bare.  
The wings bring a message  
So sweet and so dear,—  
I love to repeat it—  
"The springtime is here."

—Mrs. Geo. Gray.

PLANT the entire bunch of dahlia roots in a box of soil; keep in a warm place until sprouts appear, then remove to a cooler situation.

Begin planting out hardy plants, shrubs and vines as soon as the ground can be worked. Prune such as need it before growth begins.

Send for the flower catalogues early and make your selection of roses and shrubs, and get your orders in early so as to avoid disappointment in choice and delay in planting.

Have the man of the house make you a hotbed. He can do it easily and at little cost, and in it many varieties of flowers may be started. Have him do it now before he gets too busy with his own affairs.

If there are humps and hollows on the lawn, cut and roll back the sod, fill in level; or cut away hump, then roll back the sod, and firm down smooth. Scatter unleached wood-ashes over the lawn, and seed bare places before ground hardens.

Sow sweet peas now, the sooner the better. This is the method employed by H. A. Cassel, one of our New York folks who has gratifying success: "I dig a trench about a foot deep, then put in clay, then manure, then dirt and stamp in the seed. The clay holds the moisture."

Divide the canna roots into pieces of one eye each, and place in flats about three or four inches deep, and a couple of inches apart, according to size of tuber. Cover loosely with soil, or sand and soil, and keep warm and moist, but not wet. When they have grown four or five inches high, transplant to pots or boxes until time to set outside. The plants will show flower stalks within about six weeks from planting.

Many of the flowers that will bloom late in the autumn must be started now. Among these are chrysanthemums. Soon after the old plants are brought from the cellar, sprouts will appear. When these reach a growth of two inches, separate from the old plants, taking care to leave a bit of root attached; plant in small pots that have been filled with rich soil. Keep

them in a moderate temperature, and water well until time for transplanting to the open.

#### SOME INCUBATOR SUGGESTIONS.

BE sure that the machine stands level.

If you haven't purchased a machine, find out which make successful poultrymen around you are using. They have probably discovered which is best for their particular conditions.

When you get the machine, set it up according to the directions of the manufacturer, and follow his directions closely in operating it. He ought to know better than any one else.

Study thoroughly the best authorities on artificial incubation, but don't believe everything every old irresponsible know-it-all tells you.

Place your machine where the temperature is as uniform as possible. Most machines work better in a moderately cool temperature. The circulation of air is better than when the temperature is too high. A little dampness is no disadvantage. But sunlight should be excluded, and drafts of air must not be permitted. Still good ventilation must be provided.

Use the best oil obtainable, or arrange for heating by gas if available. Have the lamp thoroughly clean, and keep it well trimmed.

If you wish early summer broilers, and pullets that will begin to lay in the fall, February is a good time to start with the breeds like Rocks, Wyandottes, R. I. Reds, Brahmas, and other of the larger breeds. A couple of months later will do for the smaller breeds.

It's a good scheme to have your brooder ready when you set your eggs.

A house cellar, if well ventilated, is a fairly good place to run an incubator. But be careful about your insurance. You may need a special permit. Some insurance companies are very foolish about these things.

When ready to begin, heat up the machine before putting in the eggs, and be sure that it is running correctly for several hours before putting them in.—  
*L. B. Wooldridge.*

IN the gorgeous banquet hall of the Waldorf Astoria last week a woman spoke on "Higher Education in the Harem," and called for financial help, and the response from the so-called "exclusive" audience was many thousands, a single subscription being \$10,000.

To us the whole project of the speaker seems at best a fad and folly. Our hands should not be busy cleaning out the homes of our distant neighbors, when at our own doors childish hands are outstretched, dumbly imploring time to laugh and love and play and prepare their little bodies and growing minds for life's tasks, as nature intended they should.

There is no other subject more befitting the wisest laws that our legislators can frame than the protection of the children.—*Home Herald.*

## For SUNDAY READING

### MY PRAYER.

MARY C. STONER.

O my Savior, blessed Savior,  
Grant to me thy grace and love,  
Grant to me the peace of pardon,  
Grant thy wisdom from above.

For the world with all its vices  
Lures the heart from thee to stray,  
But with childlike faith and worship  
I would at thy footstool stay.

Oh, to me, my only Savior,  
Grant the gift of thy free grace,  
That the inborn sin of weakness  
May not bar me from thy face.

May the fancies fair but sinful  
Lose their oft'-beguiling charms,  
May I find my only refuge  
Safe within thy loving arms.

May the thoughts and impure motives  
That have often filled my breast,  
Find no lodgment in my bosom,  
Find no place in which to rest.

Then in holy, sacred fullness  
Come to fill this heart of mine  
With the blessed, saving presence  
Of thy Spirit, gift divine.

North Manchester, Ind.

### AFTER FOURTEEN YEARS.

Some years ago I had the privilege of leading a man to Christ who was just out of one of the New York State prisons. I was down town doing some missionary work when he came to our door. Mrs. Mackey said, "I am very glad you have come; come in, brother, and make yourself at home." When she called him "brother" he wondered if she knew who he was; it is not customary for an ex-prisoner to be called brother, and that struck him as a remarkable thing.

That night he went with me to the mission and a man whom the Lord had used me to lead to Christ ten years before related his experience. I closed up with an account of my own. My friend sat in front of me, and the gospel message went to his heart. He knelt down in prayer and called on God, although right out of State prison; and God heard his prayer and did wonderful things for him.

Now he has a mission over on the North side, and last night I was in that mission and heard a woman give a wonderful testimony. She had taken the Keeley cure twice, the Washingtonian cure three times, tried Christian Science, and everything that money and scientific research could suggest to cure her.

She was not an illiterate woman, but very talented, one who was expected to make her mark in the literary world. But sin got into her heart. She became not only a drunkard but a slave to the morphine and cocaine habits. She had taken in all seven different cures, but there was nothing that did her any good until she came to the foot

of the Cross and said, "God be merciful to me a sinner." and last night she stood up and testified, "I am rejoicing in the God of my salvation." Oh, how it made my heart glad! When they found her she was almost on the verge of insanity.

### Latter-Day Delusions.

Recently while in a large church a lady came to me and said, "I want you to pray for my husband." I said, "Sister, what is wrong with him?" Then she explained that they had been having some confusion in the church because of some newfangled things that had come in about people claiming to speak with tongues, etc., and you know the nearer we come to the coming of the Lord the more of that sort of thing we will see in the world. I hear people singing, "Oh, for a thousand tongues!" But if they are not making use of the one they have what would they do with a thousand?

Then she went on and explained to me that her husband was a drunkard. I said, "Are you praying for him?" She said, "Yes." "Does he know it?" She said, "I hope so." She had not dared to let him know she was praying for him, because she said, "Well, he is such a proud man, so haughty," etc., and she was really afraid to let him know she was praying for him.

Does it not seem nonsensical not to let the friends you love dearly know you are praying for them? I had the privilege of praying with her husband, and recently I had the privilege of coming back to that same church and meeting that gentleman and his wife and taking lunch with them. He told me that when his wife came home and told him she was praying for him it broke his heart and he had never had it mended again.

Right in your own family there may be someone who is just hungering for the gospel invitation. You may buy all the books in the world on how to win souls for the Master, but you will never do it until the Holy Spirit reveals to you your heart, helps you to put away sin, to give up the flesh and the devil and just become a child of God. That is the secret of it.

Nicodemus was a mighty man. He could read the Word of God as well as the disciples, but the Master said, "Ye must be born again." And the experience of the leprous man shows the simplicity of it. He had heard Jesus speak of that sermon on the mount and he said, "Lord, if thou wilt, thou canst make me clean." Jesus said, "I will," and just touched him and it was done. I am so glad he did not say before he did it, "Now you have got to quit stealing and smoking and swearing," etc., but that touch of the Divine finger cured him from wanting to do any of those things.

There is so much in prayer. You remember when Peter was walking on the wave and took his eyes off Christ, he said, "Lord, save me." It was a sincere prayer and the Lord saved him that quick. I would to God I might be able somewhere, in some place, to teach somebody the secret of prayer,—not saying prayers, but to pray. There is power in it. Men ought always to pray, not sometimes, but always.

### In the Last Days Perilous Times Shall Come.

"There is none that understandeth, there is none that seeketh after God." Rom. 3: 11. Is not that the terrible condition of affairs today? Some preachers say that the world is getting better. I wish they would travel with me a few months in some of the places I have been, in the levee district in New Orleans, up at the head of the Great Lakes, where Mrs. Mackey started a rescue home where-in are five girls under fourteen years of age who are

candidates for the maternity shelter. But I am glad there is power, and though sin does abound grace does also abound. "And ye shall seek me, and find me, when ye shall search for me with all your heart." Jer. 29: 13.

You need never expect to have your prayers answered unless you exercise faith with them. It goes hand in hand. Then again we so many times expect God to do things for us that are not good for us. Moody once told about his boy Will, who, when he could not get a thing that he wanted, would whimper and cry, then get on his back and kick and yell until he got what he wanted. One day when Moody was shaving, Will came and said, "I want that razor." And when he could not get it he began to go through some of his tricks.

Mr. Moody was a very tender-hearted man and it hurt him not to please the child, and he did not know what to do next. He did not like to spank the little fellow, and so he tried to find a way of escape. He noticed a large plate of oranges and apples, and, with the razor in one hand and the fruit in the other, he said, "Do you want that?" And you should have seen the boy grab the orange! He did not want the razor then.

We ask God for things that would unfit us for things he has for us to do and would hurt us, and then he comes along with some beautiful fruit, such as love, joy, long-suffering; there is a bunch of nine kinds of such fruit in Galatians 5, and they won't hurt us. I know my God will withhold no good thing from those who walk uprightly. Psa. 84: 11.

"This is the confidence that we have in him, that, if we ask anything according to his will, he heareth us." Often I have been called to pray in hospitals, prisons and sanitariums and insane asylums. One day I was called to pray with a woman who had lost her reason because of the awful calamities that had come upon her. Her husband had died, her sons, her daughters; her home had been burned up and she had lost her money. Then Satan thought he had her; but even in her deranged condition the Spirit of God prompted that woman to pray, and her reason and health were restored, and she is rejoicing to-day. She had lost all. We want to pray in faith.

When you get an opportunity to do something for God, don't see the obstacles, but be true to God and he will be true to you. I am thankful that fourteen years ago when I was walking down Van Buren Street with the intention of throwing myself in the river and ending it all, I met a man who, when I said to him, "Say, boss, won't you help me to get some liquor?" answered, "You don't need liquor, you need Jesus." I thought he was crazy! I looked at him. I had never struck anything like that before. He said it so earnestly, so forcefully, that it brought me to my senses.

There was spiritual power about the man, and my heart was smitten. Then he spoke to me. He put his arm around me and brought me into the Pacific Garden Mission. He didn't put me in a back seat and say, "Make yourself at home." No; he brought me right up in front where I would get hit real hard.

Three or four times I tried to get out of my seat to smash the speaker's face, for the devil was in me, and God was trying to get me from the devil. Finally he knelt down and talked to his Father in heaven. He was acquainted with God and he could say: "My Father who art in heaven, as you saved me save these men that raised their hands!" As he was praying, looking up in faith with his eyes closed, I got up in my drunken condition, and lurching forward tipped him over so that his face struck the edge of the platform and the blood came from

the wound. But he kept right on praying. He didn't say, "Take this old drunk away."

And so I found Christ when I was a poor, blear-eyed, drunken bum, and since then he has used me to his glory. The Lord called me into evangelistic work. Last year I had five hundred calls, and I could not of course begin to fill them all; but I traveled four thousand miles, staying two or three weeks in each place, doing what I could to win souls to the Master.—Tom Mackey in Lifeboat.

### A DISGRACE TO THE PLACE.

TEN years ago he was a man of wealth, conducting an honorable business, a director in several of the largest business enterprises of his city, on the school board, looked up to as one of the strong men of the city, and the head of a happy, intelligent and respectable family. Then came

#### The Social Glass.

That short statement of three words stands between the man described above and the one which is to follow. A wanderer from home, friendless, penniless, blear-eyed, filthy, ragged. Before his fortune was all washed away in the swill which flows over the saloon bar, he had become a welcome patron at George Green's saloon. No one was more welcome than Mr. Dan Jones. He still bore marks of respectable manhood and kept up the social grade of Green's saloon. Mr. Jones drew other men of his fiber to this saloon.

After awhile his self-reliance was gone, his money was dwindling, his standing at the saloon was not so high, his credit small. Finally after his last cent was in the saloon-keeper's pocket, his family relations all broken up, his last suit of clothes full of holes and he had nothing left but the fires of hell burning within him, calling for more liquid damnation, the saloon-keeper, with a shove and a brutal kick, sent the once respectable Mr. Dan Jones sprawling into the ditch with the statement that he had become "a disgrace to the place."

He was the produce of the saloon, yet the saloon-keeper was so ashamed of him that he banished him to make room for some other victim. A disgrace to a saloon! Well he was surely a long way down the hill if that was true, but that is saloon history. They want good men, not bad ones. They will make bad men out of good ones, for that is their chief business. The saloon hastens its millions downward, but helps no one upward.

"There is a land mine eye hath seen  
In visions of enraptured thought,  
So bright, that all which spreads between  
Is with its radiant glories fraught.

"A land upon whose blissful shore  
There rests no shadow, falls no stain;  
There those who meet shall part no more,  
And those long parted meet again."

Old sinners are not satisfied with us unless we live better than they do.—Sam Jones.

## CREAM OF MAGAZINES

### THE LEAD OF ENGLISH AS A WORLD LANGUAGE.

From the statement that English now leads all other languages in the number of its readers, and that its geographical distribution corresponds to a remarkable extent with the area of the world's greatest literacy, Mr. E. H. Babbitt goes on to predict that within the century "English will be the vernacular of a quarter instead of a tenth of the people of the world, and be read by a half instead of a quarter of the people who can read." If its supremacy is frankly recognized, he adds, "It can be made the universal reading language in even less time." Even now, he asserts (writing in *The World's Work* for February), "three-fourths of the world's mail matter is address in English, and more than half of the world's newspapers are printed in English." Moreover, as those newspapers have a larger circulation than those in other languages, "probably three-fourths of the world's newspaper reading is done in English."

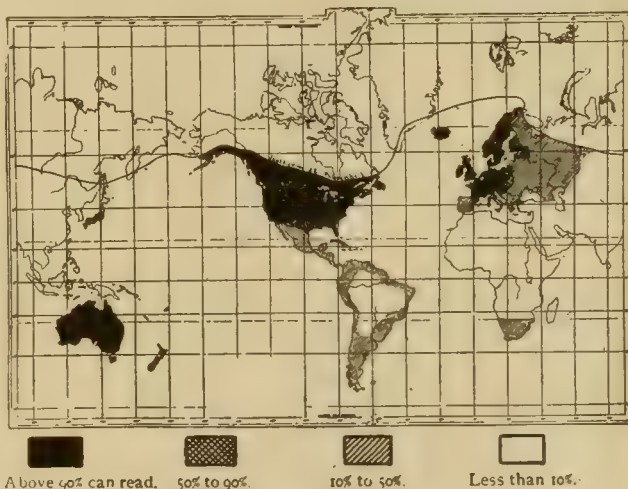

MAP OF THE ENGLISH-SPEAKING WORLD.

It is only for the temperate zones, explains Mr. Babbitt, that any reliable facts are known or predictions possible. "The future of the lands within the tropics is problematical, and the lands north of the isotherm of the freezing-point can never sustain any large permanent population." To quote further:

"A language must have a recognized literary standard, and all the people in its territory must learn to use it as such before its influence goes far abroad. English, French, and German, and they alone have reached this point. French and German have no new country, and practically the whole of their population is now literate; their relative share in the world's reading can only increase as their population increases. Spanish and Russian, on the other hand, have both new country and room for a much higher percentage of literacy.

"It is probable that all the countries in temperate zones will have universal literacy by the end of the century. In this case, even if no one read English outside its vernacular countries, it would still hold its own as the leading literary language. German and French are bound to fall off relatively as vernaculars, and this implies a falling off of their importance as culture-languages; but the importance of English in this respect is bound to grow. The first place among foreign languages has been given to it in the schools of many European and South American countries; Mexico and Japan make it compulsory in all

MAP OF THE WORLD'S LITERACY

schools of upper grades; and China is to follow Japan in this respect as soon as the work can be organized.

"The number of people who can actually read, or will learn if now too young, for the various languages of the world, appears to be as follows." [See table at end of article.]

In this table Chinese is considered not as a spoken language, but as a system of writing. French and German, the languages next in importance to English, "can not maintain their relative positions," asserts Mr. Babbitt, "because English has more than half the new land in the temperate zone, and they have none." Spanish and Russian, the languages which dominate the rest of the new territory, "are not established as culture-languages, as English is." Moreover—

"No other language, not even French or German, has a vernacular so uniform and well established, and with so few variations from the literary language. English is spoken in the United States by more than fifty million people with so slight variations that no foreigner would ever notice them. No other language whatever can show more than a fraction of this number of persons who speak so nearly alike."

| Language.                          | Numbers in<br>Millions. | Per<br>Cent. |

—Literary Digest.

### A WIDESPREAD SCIENTIFIC HOAX.

While scientific hoaxes of every sort are heard of and overthrown from time to time, there is one "fake," at least, which has managed to survive well on to a quarter century, and having crept universally into the histories, ethnologies, and anthropologies, will doubtless require many years for its complete overthrow in the minds of the public. This hoax was the plot of a simple miner in Calaveras County, California, a good many years ago, and it has been perpetuated by the most careful scientists as the famous "Calaveras skull."

Almost unknown to fame, there now lives in Los Angeles as assistant rector of the Episcopal Pro-cathedral, the Rev. Mr. Dyer, to whom belongs the credit of exposing the Calaveras imposition.

Mr. Dyer, who is now a man quite well along in years, tells his story as follows:

"I was stopping in the eighties with John C. Scribner, the Wells-Fargo agent, druggist, and keeper of the country store at Angels Camp, Calaveras County, about five hundred miles from here. This Angels Camp was a mining camp then of about three hundred population; and at the time the trick was played the population was slightly greater. I was talking with Mr. Scribner in his store, and also with an old friend of his who happened to be present, and whose name I have forgotten. Conversation led to old times, and among other incidents coming up, was the story of how they fooled everybody about the famous skull. They, however, assumed that I and every one else now knew that it was all a trick, and no longer attempted to disguise the facts, as they were glad they had a little laugh over the effect of it. What they had said convinced me that the trick was as stated. On my return to Los Angeles, therefore, I called on an old gentleman they had mentioned as having had a hand in it, and by recalling certain incidents to him, got him to recount the hoax.

"His story was a typical one of the old mining camps. The skull, he said, had been placed by Scribner in Matson's mine at Angels Camp, to fool Matson. This man Matson was a blacksmith, who, when work was dull, would dig a bit deeper down in his shaft. Scribner, therefore, dug into the débris at the bottom of the mine, and hid the skull where Matson's pick must strike it. Matson, as per the plotter's plan, went down the shaft very shortly after, struck into the earth, and the first thing his pick brought up was the skull.

"Of course Matson was astonished. The skull, he saw at once, could not have grown there, nor could it have fallen there. Matson, by the way, was really an intelligent man, one of a great number of men who had come out here to make their 'pile,' and then quit the country as soon as possible. He recognized the possible value to science of the skull, and took it to Scribner's partner, who

took it to Scribner, telling him of the find. The joker kept his secret, and the fame of the skull spread. Gradually both the story and the cranium came into the possession of a certain Dr. Jones, of Murphy's Camp. When State Geologist Whitney came through that part of the State, he was made acquainted with the find, and secured the valued treasure. He, after investigation of the place of finding and the nature of rock, gave credence to the tale, and proclaimed the finding of the skull of a man of the Pliocene period.

"It remained for a poet, Bret Harte, to hit at the truth—in a humorous poem suggesting that the skull was that of a Digger Indian. Scientists the world over, however, felt assured that the oldest human remain now known was that of this creature of the Pliocene era. Only Prof. Le Conte, of the State University, was dubious, and his scruples were based on a feeling that there never had been definite proof that the skull had been found where stated. He, however, described what facts were known to him, and let the question remain open. Meanwhile the Smithsonian Institution sent men to take samples of the earth from the surface at Angels Camp, and at different depths in that shaft. The wiseacres also inspected the skull, and found some earth inside it. This they took away to analyze, but no one knows what their tests proved. Possibly they learned that there was a stratum of the earth of today down in the bowels of the Pliocene strata, a statement so ponderous they felt it would not do to make it public.

"From time to time one has heard doubts expressed about the skull. The old men of the camp locality have long known the truth, and told it to anyone who would ask and listen. It is one thing, however, to proclaim a discovery, and have it taken up by the press, and quite another to get a denial as widely spread. When I discovered the facts, Scribner had been dead several years, and at rest back in New York State. At the time of his funeral, I was told, they pronounced quite an oration upon his career at Angels Camp, when again the story was told, and his sister has written me that she, too, for a long time knew the truth about the skull. I first told the facts to a reporter of the *Los Angeles Times*, but history seems to stick to the delusion. I visited Angels Camp for the last time in the eighties. Near the foot of the camp there was then still an Indian burial place (there having been an Indian village nearby), and skulls could readily be obtained.

"As to the skull, there are pictures of it in the reports of the Smithsonian Institution, and from these it is evident that the Indian was a Digger, and that he had died of violence, having been crashed on the head by a heavy bludgeon, in such wise as to cause him to throw the head far back, so that it is on a level with the spine, a bit of the backbone still remaining."—*Scientific American*.

The American people believe in free speech, but they do not believe in that sort of free speech which incites to murder. Public meetings called to honor assassins who have died at the hand of the law, or to denounce the conditions of legal society, and declare that officers of law or certain classes of citizens, ought to be killed, or that in any other way the regular operation of law should be violently resisted, are not peaceable meetings and should be interdicted, even as the law provides. So foreign anarchists should be deported, and native anarchists forbidden to preach the gospel of murder, and their meetings should be suppressed, but with discrimination and intelligence. In a land of freedom, where the people rule, there is no excuse for anarchism.—*The Independent*.

# Echoes from Everywhere

## FOREIGN.

The first mammoth warship of the German Navy was successfully launched March 7 and christened Nassau by the Grand Duchess of Baden. The Nassau displaces 17,960 tons and is built entirely of hardened steel. Her dimensions and the thickness of her armor are not exactly known, as everything connected with her construction has been kept strictly secret by order of the Marine Minister. It is known, however, that she is to be fitted with three sets of triple expansion reciprocating engines, and is to be provided with three propellers. The minimum speed she is specified to attain is nineteen knots. Her crew is to number 866, including 27 officers. The cost of construction, including trial runs, will total \$9,190,000, of which \$5,567,500 are accounted for by the hull and internal fittings, \$3,375,000 for artillery, and \$247,509 for torpedoes.

In Germany the school children can get hot or cold milk merely by dropping a coin in a slot. One slot, says Popular Mechanics, furnishes paper cups which are thrown away after being used. When the coin is placed in the slot the milk tap protrudes from the box, and when a lever is released it disappears again to be rinsed by a device which cleans it thoroughly. When hot milk is desired an indicator is moved over the "warm" mark, and enough milk to fill one of the cups leaves the tank and runs over a flat surface under which a spirit lamp is burning. The lamp lights when the indicator is moved. As is usually the case in Germany, the sanitary regulations are fulfilled to the letter. Once a day the milk tank and its connections are taken out and cleansed thoroughly.

Recent French official figures show that of over 14,000,000 adult women in the republic, nearly 6,500,000 work for their living. The highest wages earned are by the cutters of precious stones in Paris, who get about \$1.87 a day. The smallest wages are earned by dressmakers, who get an amount equivalent to five cents together with two meals a day. The average factory worker receives from twenty to fifty cents per day. It would seem that "underpaid" women in England and America do better than their French contemporaries.

## SCIENTIFIC.

An instrument has been devised for making complete tests of street cars while in operation. It consists of a table over which a roll of paper is fed slowly, above which are arms carrying small recording instruments. Each of these instruments is connected with a clockwork mechanism which causes it to register on the moving paper below every five seconds. Each instrument registers a special value—such as the amperes and volts used on each car motor, or the speed of the car or its location on the line, etc., so that for every trip of the car over the

road this device furnishes a graphic record far more accurate than could be made by any number of observers.

The Biological Society at Paris has received the reports of two eminent French physicians deputized to inquire into the vexed question whether smoking is injurious to women or not. The overwhelming testimony presented shows that it is, and that the use of tobacco especially interferes with woman's prime duty, motherhood. Statistics regarding the state of health among the female employes of the government tobacco factories prove that the handling of tobacco and the making of cigars and cigarettes means early death to a great many of the working women and girls. Among those who smoke, in addition to handling tobacco, the mortality is greatest. The investigation includes the collection of statistics regarding the married state of tobacco workers. The figures show that a greater percentage of them than in other trades are childless, while the mortality among their children is exceedingly large. Most of the children die at a very early age.

A New York scientist who is a woman, by the way, has been attracting the attention of the French Biological Society by her method of resuscitating animals apparently dead from electrical shock. She says that the cases are rare in which the victims cannot be recalled to life. Dr. Leduc and other experts have experimented along the same line, but have not used the New York woman's plan of procedure, which is to place the negative pole near the spinal column, and the positive pole over the kidneys. The patient is then given a series of rhythmic electrical impulses which restore the respiration and the cardiac reaction, and the animals—she has not tried the treatment on men—which seemed dead, come to life, the resuscitation, in fact, being very rapid. Application is to be made to the New York authorities to permit the treatment to be given the next criminal to be electrocuted.

## PROHIBITION.

Both houses of the Ohio legislature have passed a county local option bill. It provides that election may be held within any county to vote on the question banishing saloons upon petition of thirty-five per cent of the qualified voters. A majority of the votes cast shall determine the policy of the county, but in event of a county's voting against prohibition no township residence region which has voted for prohibition shall be affected thereby. Elections may be held every three years. Stringent regulations for the enforcement of the law are provided. The law will not go into effect until Sept. 1.

The Chicago and Northwestern Railway company has established a new precedent in the method pursued in "laying off" superfluous employes. Instead of giving preference on point of age, length of service, etc., as

heretofore, the men to go are those known to be in the habit of frequenting saloons, evidence on this point being furnished by the company's private detective force. The first application of this rule resulted in the circulation of a temperance pledge by the employés, which at last report had been signed by 25,000. Every employé is asked to sign and when completed the monster pledge will be presented to the president of the road.

In Stoddard County, Mo., when we had \$15,000 a year from the saloons, our criminal court cost us from \$20,000 to \$22,000 a year. Now, under local option Prohibition, the cost is about \$1,700 a year.—Judge Fort.

Wheaton, Illinois, county seat of Du Page County, population 4,100, is one of the most enterprising Prohibition towns in the west. Recent interviews with its leading officials show that intoxication and other crime is practically unknown while property values and public improvements are noteworthy. There are three ward school buildings, a prosperous college and an academy, while the high school is overcrowded, including many pupils from nearby license towns unable to support high schools. Electric lights, gas, sewerage and drainage systems, and miles of paved streets and city sidewalks add to the convenience and attractiveness of the little city. Wheaton is the home of State Chairman Alonzo E. Wilson, Illinois Prohibition Committee.

The Kansas Inter-Collegiate Prohibition State Convention was held at McPherson College, March 6 and 7. The leading speakers of the conference were President H. S. Raymond of the Kansas State Association and Traveling Secretaries Walter E. Critchlow and Wm. A. Rice. The State contest which packed the opera house on Friday night, was full of enthusiasm, reflected from the various college delegations present. Nine colleges of Kansas sent strong contestants.

Iowa Prohibitionists are setting their mark for 400,000 signatures to the State-wide petition for constitutional Prohibition. Their aggressive activity is already exciting the liquor politicians who are flooding the State with whiskey tracts and leaflets.

Detroit business men, with capital exceeding \$10,000,000, have united for the strict enforcement of the liquor laws in that city.

\* \* \*

#### GENERAL.

It will be recalled that in 1905-6 a large number of English teachers came over to America to inspect our methods in the public schools. Taking the cue from this the National Civic Federation has made arrangements to send about 500 or more American public school teachers to England, Scotland, Ireland and the continent to make an inspection of the various school-teaching methods of foreign countries. The teachers who make this trip will have an opportunity to examine at first hand what is being done for children abroad, both in the common schools and in the special schools. President Nicholas Murray Butler, of Columbia university, has been appointed chairman of an advisory committee to carry the plan through.

John R. Walsh, president of the wrecked Chicago bank, has been sentenced to five years' imprisonment in the government prison at Fort Leavenworth, Kans. Walsh's

attorneys immediately began preparations to file a bill of exceptions in the United States Court of Appeals. More than four years have elapsed since Walsh committed the first violation of the banking laws charged in the indictment against him; two years have passed since his arrest, and if the higher courts should upset Judge Anderson's decisions, there is no forecasting how many years longer the battle for this old man's freedom can be dragged out through the federal courts.

Oregon is working out a good many ideas that are fixing the attention of other states, not the least of which is her primary law for the election of United States senators. Jonathan Bourne, junior senator from that State, claims to be the only man in the senate who holds his place by virtue of the direct voice of the people, for the Oregon law makes the election of a senator by the legislature practically a mere form. Of course the popular choice as revealed in the primaries is not mandatory upon the legislature, although it is morally bound to follow the wish thus expressed by the people, just as in the case of the presidential electors who could, if they chose, vote otherwise than in the way in which they have been instructed.

The old wagon in which John Brown rode to and from Iowa City during his anti-slavery crusade was destroyed by fire at Iowa City recently. The fire left two charred wheels, which will be preserved by the Iowa State Historical Society. The wagon was owned by the family of Herbert S. Fairall, late secretary of the Northern Wisconsin Land association. John Brown spent many months in Iowa City, and the weather-beaten hotel where he "put up" is still a landmark there.

President Roosevelt is preparing to wage relentless war on stock gambling and all forms of trading on margins or dealing in futures. He has begun laying in a supply of ammunition for this purpose by instructing Herbert Knox Smith, chief of the bureau of corporations, to conduct an exhaustive and comprehensive investigation and ascertain to what extent this form of gambling may be controlled by the federal government.

The provision for pneumatic mail tube contracts carried in the postoffice appropriation bill has been pared down to a bare half dozen lines, but left in such a manner that the postmaster-general will have authority to contract for the extension of tube service in Chicago or in any other town where it may be needed, provided he acts within the appropriation.

# Facts Regarding Imperial Valley

Some people in trying to induce their friends to settle in the country where they themselves are located, frequently send them advertising matter that is gotten up by unscrupulous land agents that deviates from the truth. Their friends come and buy property and soon find out that the facts do not correspond with the advertisements sent them. The result is they soon become discouraged and sell out at a sacrifice, and go back where they came from, worsted financially and in some instances say worse things of the country than they should, and thus bring reproach on a good country (though not as good as the advertisement represented it to be). The undersigned has known this to happen more than once, and for this reason has decided to tell his brethren and friends about the Imperial Valley in his own words, so that he alone shall be responsible, and so that the wonderful Imperial Valley may never be made a reproach and a by-word.

Imperial Valley is situated in San Diego County, California, 183 miles east of Los Angeles on the Imperial branch of the Southern Pacific railroad. The soil is an alluvial deposit and all crops are grown by irrigation, with water from the Colorado River. The main irrigation canal is 80 feet wide on the bottom and 100 feet wide on the top, and 10 feet deep. The soil is adapted to the growth of wheat, barley, alfalfa, and nearly all kinds of fruit. Alfalfa having plenty of water can be cut eight times per season, yielding as high as ten tons of nice hay per acre which sells at present from \$8.00 to \$11.00 per ton. Barley can be sown for winter pasture in alfalfa stubble after the last crop of hay is harvested. Alfalfa can be cut every three weeks if the hay is wanted for dairy cows, or every four or five weeks if wanted for horses. I have known of alfalfa yielding \$40.00 worth of seed per acre and my own yielded \$20.00 per acre with the first season's sowing. Dairying and hog raising are very profitable. Butter sells from 20 cents to 45 cents per pound; hogs, 7½ cents on foot; also beef, cattle and horses do excellently. One colt weighed 960 pounds at less than one year old. One acre of alfalfa will keep from 2 to 3 head of dairy cows or horses and from ten to fifteen head of hogs. Oranges, lemons, dates, figs, apricots, grapes and berries do well. A single grape vine has yielded 30 pounds of grapes 18 months from setting. Grapes, apricot and cantaloupe growing is very profitable as they will ripen here from three to four weeks earlier than other places, and be placed on the eastern market before they are ripe in other localities. One man at Coachella was offered \$600.00 cash for the grapes on a single acre of vines and refused the offer and sold at retail for \$1,400.00. Cantaloupes will net the growers from \$50.00 to \$300.00 per acre. I have lived in the valley as long as any one, being one of the first settlers, and my experience and observation has taught me that you can grow almost anything here you plant, including vegetables, if planted in the proper seasons and properly cared for. The selling price of land at present is from \$40.00 to \$100.00 per acre, owing to location. President Roosevelt says that when it is thoroughly developed it will be worth from \$500.00 to \$1500.00 per acre.

Reader, when you shiver around your fireside the coming winter, just think of the Imperial Valley where you can go in your shirt sleeves nearly every day in the year. And on the 10th day of this month (May, 1907), while there was a snow storm raging in many places in the eastern states, we were making hay and picking and eating fruit in the Imperial Valley.

Will send, express prepaid, for 75 cents extra.

## Mr. World and Miss Churchmember

By W. S. Harris.

It is a forcible allegory, somewhat after the style of Pilgrim's Progress, but in no sense an imitation of it. Fathers and mothers, it is the book that you should get for your son and daughter, and at the same time read it yourself. You will be stronger for the church after having read it. It illustrates vividly how Satan lures the church member, step by step, from the pure Gospel.

till finally he is lost forever. Send in your order at once and you will never regret it. Cloth only.

Our Price, Prepaid .....\$ .75

# ALBERTA

## ¶ Of Alberta a distinguished writer has said:

"North of the International boundary line and immediately east of the Rocky Mountains lies the Province of Alberta—a land blessed with all that is necessary to happiness and prosperity. Between the 49th and 60th parallels and between the 110th and 120th meridians lie 281,000 square miles of possibility. Here are mountains and plains, foothills and valleys, rolling prairies with wooded stretches between, dense forests and grassy meadows, clean, timber-girded lakes and winding brooks, cold mountain streams and navigable rivers, and a soil rich in the alluvial and vegetable accumulations of centuries. And as if not content with these outward signs of her favor, nature has hidden beneath the surface vast deposits of coal and other minerals; she has filled the subterranean reservoirs with gas and oil, and sprinkled the sands of the mountain streams with gold. That no living thing should go athirst, she gathered together the waters of the mountains and brought them to the plains, to be directed by the ingenuity of man to the use of the grazing herds and the planted fields. Then, to crown her efforts and leave nothing incomplete, she brought the chinook wind, warm with the breath of May, to temper the north wind."

¶ In the Medicine Hat District we have a gently undulating prairie. The soil is capable of producing generous yields of all small grains and vegetables in abundance.

¶ The city of Medicine Hat, situated on the Saskatchewan river and underlaid with gas and coal, is destined to be a great manufacturing center.

¶ Why not join the colonies already there and enjoy some of the material benefits as well as help build up one of the largest and best colonies in the Canadian West.

¶ We have excursions every first and third Tuesday of the month.

¶ For particulars and cheap rates apply to

# POOR DIGESTION

These words mean more than what many men and women realize.

Study mankind. He derives his strength from what he eats—if it is properly digested. If this is true then how can he gain strength if he does not have an appetite or what he eats does not digest?—Weak? Yes he is weak and grows weaker by degrees. You say he needs a tonic,—this is what he needs: **BRAWNTAWNS, THE VICTOR TONIC.**

Brawntawns builds up run-down systems,  
Restores appetites, strengthens and  
Aids the digestive organs by  
Working in harmony with Nature.  
Nervous, weak men and women who need a  
Tonic and will try it, especially  
All nursing Mothers and convalescents,  
Will find it a great blessing as a  
Nerve renewer, Health restorer and a  
System builder. 50 cents postpaid.

Mr. Wm. E. Gannon, the express driver of Frederick, Md., says: From personal experience I am made to say I firmly believe **Brawntawns, The Victor Tonic**, is the best Tonic and System Builder, in fact it has proven to be in my case.

I was so weak and run down that it was very difficult for me to ascend a pair of stairs, but after using **Brawntawns, The Victor Tonic**. I became much stronger and could go about my work with much more ease.

I wish further to say that I have been using the **Victor Remedies** in my home for 29 years during which time I have given all a fair trial and have never known any one of them to fail to do what is claimed for them. **Victor Remedies** compose my medicine chest.

**BRAWNTAWNS, THE VICTOR TONIC**, can be sent by mail upon receipt of price 50 cents.

## Victor Tea

*(The Old Fahrney Blood Purge)*

**The Blood Purifier,                      The Liver Renovater,  
The System Cleanser**

VICTOR TEA is a purely vegetable compound just as pure as if you were to go into your garden, along the bank of a stream or on the mountain heights to select your own herbs, roots, barks or berries, and the proportion of roots, herbs barks and berries contained in Victor Tea are unequalled for all Blood and Liver Diseases, Colds, Headaches, Constipation, Over-loaded Stomachs, Etc.

Do you have a tired, dull, sluggish feeling, cannot rest, work drags? All this is caused from an inactive, torpid liver, which is clogged by the impurities of the system and if not carried off will cause a more serious trouble.

VICTOR TEA, The Blood and Liver Purge, purifies the Blood, renovates the Liver and acts upon the bowels thereby thoroughly cleansing the entire system. VICTOR TEA can be sent by mail or purchased through the Dealers. Price 50 cents postpaid. Try a package now.

**ROGUE RIVER VALLEY  
OREGON**

A Yellow Newtown Apple Tree. From one and one-half Acres, S. L. Bennett of Medford, Oregon, Obtained the Present Year about \$1,400, and can Repeat the Story Next Season. Single Trees in His Little Orchard Produce 25 Boxes of Apples.

A Butte Valley Apple Orchard, Well Laden.

### In BUTTE VALLEY

Apples and other fruits, such as berries, cherries, pears, etc., are perfectly at home. One of the most profitable industries that could be taken up here, however, is apple raising, because the quality is of the very best, the market has never been supplied, and most generally apples sell for more per box than do oranges. Besides, the pests that ruin fruit trees in the East are yet unknown in the valley, and the closest care is exercised by the State authorities in protecting the fruit trees all over the State.

Write for Booklets describing Rogue River Valley and Butte Valley. They are FREE.

Idaho, Oregon, Washington and  
California Points.

### TOURIST SLEEPING CARS.

A striking feature of the Union Pacific passenger trains is the tourist service. The tourist sleepers are identical with the standard sleepers, with the exception that their furnishings are not on so grand a scale, but the accommodations are equally good and are sold at HALF THE PRICE of the standard. The seats are upholstered, and at night the berths are hung with heavy curtains. Each car is accompanied by a uniformed porter whose duties are the same as those upon the Pullman Palace Sleepers.

### DINING CARS.

Union Pacific dining cars are operated on all through trains. These cars are all new in style and models of beauty and elegance.

### DINING ROOMS AND LUNCH COUNTERS.

Dining Rooms and Lunch Counters are located at convenient points along the line, and all through trains which do not carry dining cars are scheduled to stop at these points. Well prepared meals of the best quality are properly served at popular prices. Full time is allowed for meals.

# Opportunity and Procrastination

## MANUSCRIPT OF THE LATE SENATOR INGALLS' FAMOUS POEM "OPPORTUNITY"

*Opportunity  
Master of human destinies am I!  
Fame, love and fortune on my footsteps wait  
Cities and fields I walk. I penetrate  
Deserts and seas remote. And passing by  
Hovel and mart and palace, soon or late  
I knock unbidden once at every gate!  
If sleeping, wake; if feasting, rise before  
I turn away. It is the hour of fate.  
And they who follow me reach every state  
Illotals desire and conquer every foe  
Save death. But those who doubt or hesitate  
Condemned to failure, penury and woe  
Seek me in vain and uselessly implore  
I answer not, and I return no more!  
Geo J. Ingalls*

Read what Senator Ingalls has to say in the Illustration, about Opportunity. There is an old adage "Procrastination is the thief of time." Both these sayings are very applicable to our beautiful valley in Northern California. It is one of the greatest opportunities that has been offered to the American people, for a good home in a beautiful country, at a small figure. The soil is rich, the water is plentiful, the climate is mild and pleasant, and the future of the valley is certainly very promising.

Too many have already neglected what they intend doing later. While it is not by

any means too late to move to Butte Valley, yet ten thousand acres have already been sold and prices are advancing rapidly. Thirty-eight people went to Butte Valley on the 3rd of March Excursion, and there are to be more excursions as follows: March 31, April 14, and April 28. These will be personally conducted excursions.

# JERRY McAULEY An Apostle to the Lost

Edited by R. M. Offord

The new and largely revised edition of the book just published is neither biography nor autobiography but the happy blending of both. The editor gathered together the fragmentary accounts of the man's own life and with suitable explanations wove the entire into a most complete story of one of God's humblest servants and yet earth's greatest men. Jerry's own account of his sinful life is put in that language which shows he was keenly sensible of his awful guilt. And while the reader gets a clear insight into his life, it is in such a manner as not to feed the baser of human nature, but rather to rejoice that one should be saved from such lower and devilish depths.

To read his "testimonies" and to stop and ponder on them is to find the clew to his power. Here is one of them. "I have nothing to be proud of; I am proud of my Savior and not of myself. I was a notorious drunkard and gambler. Even my wife does not know of some of the sins I committed, and she never will till the Day of Judgment. I don't know what to say to express my feelings of thankfulness. I know I have been converted, that is, if conversion is ceasing to love that which is evil and loving that which is good. I know that divine grace saved me from a drunkard's grave."

## Kindle the Flame in Other Hearts

It is a good thing to write and print and spread the life of such a man as the hero of this volume. It may kindle the flame in many other hearts. Christians in other walks of life than he trod may be stirred to better living. And some poor, sinning soul, some wretched and sinking soul, some poor sinner, almost as bad as Jerry was, may read it in his extremity, and cry out with this ransomed prisoner, "Lord, save me, I perish."

## Every Church Worker

Should read this book, to get more inspiration and encouragement in Christian duty and privilege. Well bound in good cloth and stamped in gold. It contains over 300 pages. Price prepaid, \$1.00.

**BRETHREN PUBLISHING HOUSE, ELGIN, ILL.**

## *The Latest Examination Book* **OHIO EXAMINATIONS AND ANSWERS FOR 1906-'07**

This splendid volume, known as Volume 3 in the Series of Ohio Examinations and Answers, contains about 400 pages, is bound in fine silk, and is uniform with Volume 2 in the series.

**The Subjects Treated.**—Complete and Authoritative Answers to all subjects for Elementary Certificates for the twelve examinations for the year ending August, 1907—12 complete sets of examinations in each subject, all fully and ably answered and discussed by prominent public-school and college men, who sign their names. Besides these answers to all the elementary examinations, **not a question omitted**, there are about 100 pages of answers to quarterly examinations in High-School subjects—Chemistry, Physics, Latin, General History, Civil Government, Botany, Geometry, Algebra, and Rhetoric.

**The Demand.**—Thousands of teachers and superintendents have purchased these books, and almost every teacher who secures one copy wants the others in the series.

**The Price.**—Only \$1.50 prepaid. With THE OHIO TEACHER one year only \$2.00. Volume II, the companion book for 1905-06, and Volume III both to one address only \$2.50. Address

## Wonderful Possibilities

for homeseekers and investors. Climate Mild. Soil Very Productive.

Alfalfa, Sugar Beets, Fruits, and grains of all kinds are among the products that yield abundantly. Farm hands, carpenters, mechanics and in fact all classes of workmen will find plenty of work at good wages.

## Come and See

"WE MADE NO MISTAKE"

Twin Falls, Idaho.

Twin Falls Land and Water Company.

Gentlemen: On the 6th of April, 1906, I landed on the Twin Falls Tract to stay. I had been here twice during the winter "to see" and thought I had seen the opportunity of a lifetime for a man of small means to make a profitable investment and establish a comfortable home. Our experience has convinced us that we made no mistake.

Respectfully,  
John R. Newton.

Pullman, Washington.

C. O. Merrell, Twin Falls, Idaho:

Professor Fulmer, Chemist, of Washington State University, has made his seventh test of soil from lands under the Twin Falls Canal system. He finds a small trace of alkali and thirty per cent more plant-producing qualities than in the Yakima Valley, and there is only one place on the Pacific coast where is is equalled, and that is in the Pajaro Valley in California.

A. T. Farris.

Mr. B. F. Hurst, Fruit Inspector of Dist. No. 5, of Idaho, states: "The Southern part of Idaho is second to no other part of the known world as a fruit producer, both in variety and quality."

## BENEFICENT WORK of GEO. T. ANGELL

THE MASSACHUSETTS SOCIETY FOR THE PREVENTION  
of CRUELTY TO ANIMALS and the AMERICAN  
HUMANE EDUCATION SOCIETY

Majorie Johnson

BEFORE entering upon an account of the work of the Massachusetts Society for the Prevention of Cruelty to Animals, the American Humane Education Society, and the Parent American Band of Mercy, it may be well to glance briefly at some of the main facts in the life of the president and founder of these societies.

George Thorndike Angell was born in Southbridge, Mass., June 5, 1823, his father being the Reverend George Angell, a Baptist minister of marked ability, and his mother, Rebecca Thorndike, a woman of rare strength and beauty of character. His father dying when the boy was about three years of age, his care and maintenance thenceforth devolved upon his mother, who nobly fulfilled the trust. "No man ever had a better mother," is Mr. Angell's tribute to her worth.

From *The American Boy* for July, 1906, in which appeared an article on Mr. Angell by the writer, the following words are quoted: "The work which Mr. Angell has done for the suffering dumb creation is well known throughout the civilized world; few, perhaps, appreciate the great difficulties with which he had to contend at the outset. He was a man eminently fitted to lead a great movement; a college graduate whose facilities had been stimulated by a struggle with poverty in early life; whose indomitable will had overcome obstacles and carried through projects in the face of opposition which would have crushed one of less splendid fibre; a lawyer, possessing a keen, judicial mind, logical, capable of intense concentration; of unusual quickness of perception; possessing also a moderate competence which rendered him to a great extent independent of outside aid and enabled him to undertake the publishing and distributing of vast quantities of literature, as well as to travel from place to place and disseminate by personal influence the knowledge on this important subject of kindness

to animals which he wished to scatter broadcast over the land. In order to accomplish the great work which he had set himself to do, it was necessary that he should renounce the legal career of unusual brilliancy, and this he did not hesitate to do, although how great the work would become, and how widespread its influence, he little dreamed at the time."

As a boy he early began to take an interest in animals; he handled with safety dangerous dogs that others feared to handle; a horse so spirited that others could with difficulty get into the saddle would stand quietly for him; a cow that he once found in distress and relieved showed her gratitude by lapping his coat sleeve with her tongue; pigeons and sparrows came to him every day for food; his canary followed him about from room to room like a pet dog. As time went on he grew more and more desirous of righting the wrongs of the dumb creatures, so entirely at the mercy of man whose tender mercies were so often cruel. With him, to see a wrong meant to put forth every effort to right it. When cases of cruelty came under his notice, such as a horse being ridden to death in a race, or the barbarities practiced in so many of the stockyards, when there was no law to prevent or punish the offenders—these things so wrought upon his sympathies and burned into his brain that he resolved to give up his successful career as a lawyer, his chances of business prosperity, and devote himself entirely to the righting of these wrongs. Some one must do the work and it must needs be that the man to do it was one possessing within himself the elements of success in whatever work he might undertake.

After strenuous days and sleepless nights, wherein plans for the work were laid, in 1868 the Society for the Prevention of Cruelty to Animals was formed. Its act of incorporation was obtained, its constitution, by-laws, and the laws under which it was to prose-

cute, drawn up; then came the important question of how to obtain funds to carry on the work. This was settled in a remarkable manner. To use Mr. Angell's own words: "Going up Washington Street we passed a man connected with our police force and it flashed upon our mind that this man could help us, so, turning we overtook him. The result was that we saw our Chief of Police, the Mayor, the Chairman of the Police Committee of Aldermen who was a client of ours, and our City Attorney, and with their aid had seventeen, picked from the whole police force of the city and clothed in their best uniforms, put under our orders for three weeks to canvass the entire city for funds, being the first time in the world, probably, that a police force was ever employed for any such purpose. The result was that with various memberships the sum of about thirteen thousand dollars was obtained to begin our work."

After the formation of the society Mr. Angell traveled all over the country from New England and Dakota in the north, to New Orleans in the south, investigating the condition of the animals and the work done for them. He preached the gospel of kindness wherever he went and his audiences have been state legislatures, colleges, universities, normal schools, national and state conventions, the assembled police of Philadelphia, three thousand drivers and teamsters in Boston, great union meetings of clergy and churches in the northern, eastern, western and southern cities.

A trip abroad brought him into contact with the workers in this cause in Europe. In London he called at offices of the Royal Society for the Prevention of Cruelty to Animals, the mother of all the other humane societies of the world. This brought him into contact with such distinguished people as Lord Bishop of Gloucester and Bristol, Field-Marshal Sir John Burgoyne, then an aged man, the Baroness Burdett-Coutts, who became his firm friend and helper in the English work, and others. He then proceeded to Paris where an interesting sight to him was the presentation of a medal to a little boy who had given his dinner to a starving dog on the street. This pleasing presentation occurred at the annual meeting of the French Society for the Protection of Animals. In Switzerland the famous dogs of Saint Bernard claimed his attention, and in Venice the daily feeding of thousands of pigeons in the square of San Marco.

Mr. Angell had already started his paper, *Our Dumb Animals*, of which the first issue comprised two hundred thousand copies, and while in England, instead of, as was expected, seeking subscribers for his own paper, he urged the directors of the Royal Society to start a paper similar in aims and purposes to his own. He had the pleasure of afterwards assisting to name his paper, *The Animal World*. Informing those who thought he had come to England to collect money for his society that he "came to spend

money, not to get it," his influence for good was vastly augmented by this independence of their purse strings.

The formation of the American Humane Education Society followed as a natural sequence upon the society for the prevention of cruelty. It was formed in 1889, its object being to create a public sentiment in favor of kindness to animals, to show the immense importance of teaching the children of our public schools the principles of humanity in dealing with the dumb creatures, to distribute vast quantities of literature, and to keep the movement before the public eye. This society has done untold good in the distribution of its literature, in the offering of prizes for essays and stories dealing with kindness to animals, in the publication of humane literature, and in many other ways. Among the most important of its publications, the book, *Black Beauty*, which has been called the "Uncle Tom's Cabin" of the horse, has had a circulation of over three million copies, has been translated into most European languages, and into three Asiatic. The simple eloquence of this book appeals to the heart as many a more ambitious tale would fail to do.

Among the prizes offered by this society recently have been two for essays on vivisection, a subject which is at the present time occupying a large place in the minds of thinking persons. The prizes offered were for the best essays for and against the practice, and the object in offering them was to so bring the matter before the public as to create a discussion which should result in the formation of a proper public opinion upon it. Much interest was caused by the offering of these prizes, and the essays which were selected as the winners present the subject on both sides in a clear and impartial manner. These essays will be sent free to the editors of all newspapers and magazines in America north of Mexico, and no better way could be found of placing the matter fairly and squarely before those who so largely influence public opinion.

Other prizes now offered are: a one thousand dollar prize for the best story showing the folly and wickedness of international wars; one thousand dollars for the story best suited to make the rich and the poor more kind to each other, and so harmonize the disputes between capital and labor. A few months ago a sum of one thousand dollars was paid for the best drama of *Black Beauty*, and a like sum is now offered for the best drama of *The Christ of the Andes*. As the secretary of the American Humane Education Society says: "These are liberal offers, but, as I once said to a reporter in Mr. Angell's hearing, money is no object if we can get the goods. We want a drama and two stories that shall be worth a thousand dollars each, and if we don't get them for that Mr. Angell says he will double the offers."

It will be seen from these facts that the society is using the large funds placed at its disposal in the

way best calculated to secure the desired object. The societies have the entire confidence of the public, to quote from the report for 1907: "The funds of both our societies are placed for investment in the hands of three trustees, who have as high a reputation for integrity and ability as any three men to be found in Boston. Legacies to our societies have been given already in two hundred and seventy-three wills, not including others now in process of settlement. The payments of the two societies last year were \$61,213.83, which was more than the receipts, but the present year our receipts are likely to be considerably increased and the payments made greater than last year."

The American Humane Education Society elects its directors for life or during good behavior. The directors of the Massachusetts Society for the Prevention of Cruelty to Animals are elected annually, but every nomination must be made a week in advance of the annual meeting to avoid electing undesirable persons. To quote again from the admirable report of Mr. Guy Richardson, secretary of the A. H. E. S.: "The Massachusetts Society has on its roll twenty-five employes, men and women, who are paid full salaries; and an agent in practically each one of the three hundred and fifty-four cities and towns in the state to whom it pays expenses. It has an officer on duty in its offices at all hours of the night. . . . Our ambulance is also, in this way, made available at any hour of the night as well as day. . . . Another officer is on duty during all the day hours of Sunday with liberty to call on the police for all the help he needs. We have one agent who devotes his entire time to the destruction of sick and suffering animals."

The *Parent American Band of Mercy* was started in 1882, and several interesting incidents occurred in connection with the movement. It was of all things important that the right man should be found to take it up, Mr. Angell's time being more than full already with the numerous projects of the societies, and while he was considering where this "right man" could be found, Judge Parmenter of the Municipal Court, sent to him the Reverend Thomas Timmins "who was of all men just the man he wanted." Among the first Band of Mercy members were, the Governor of the State, the Chief Justice of the Supreme Judicial Court, the Roman Catholic Archbishop, Wendell Phillips, and others of equal prominence. "Its work is done by and under the direction of the American Humane Education Society." Between seventy and eighty bands, comprising nearly three million members, have been formed, and new bands are being daily added to the list. "It is a great army of mercy, so large that if marching in single file it would reach not only from Boston to Chicago but some hundreds of miles beyond." Over twenty thousand new mem-

bers were added at the great New England Food Fair held in Boston in October.

Mr. Angell married in 1872 a lady whose kind care, as he says, has probably added more than ten years to his life. He is a firm believer in special providences, as a perusal of his fascinating autobiography will show. In a recent article published in *Our Dumb Animals*, he says: "The fact that with always delicate health and many sicknesses and hundreds of nights with no sleep, and tens of thousands of nights with very little sleep we should now, in our eighty-fifth year, have outlived every humane worker we can remember at the starting of our Massachusetts Society, and be able now to be hard at work every day with a possibility of being able to do it some years longer, seems to us singular.

"We know that some good people (how many we do not know) have during many years been offering up prayers for the preservation of our life. How much influence those prayers may have had we do not know, but the Bible tells us that the fervent prayer of the righteous availeth much."

Mr. Angell is a great worker in the Peace movement. "He is the most effective peace worker we have," is the testimony of the secretary of the American Peace Society to his work in this direction. One of the aims of the American Humane Education Society is to teach children the monstrous nature of war and the gentle, refining principles of peace, which if taught to the children of our land, thus leavening the sentiment of the nation, would cause wars to cease from the face of the earth. In an article on "A Chinaman's Experience in America," Mr. Angell says: "The question whether America will be at war with this great nation (China) or shall find in it its most profitable customer for all we produce, is to depend upon the humane education which we are now trying to give our people, and which our American Education Society is endeavoring to carry to all nations under its flag on which is inscribed, 'Glory to God,' 'Peace on Earth,' 'Kindness, Justice and Mercy to Every Living Creature' (both human and dumb)."

The officers of the societies are: Geo. T. Angell, President; Hon. Henry B. Hill, Vice-President; Hon. Albert E. Pillsbury, Counselor; Guy Richardson, Secretary; Hon. Henry B. Hill, Treasurer; Eben. Shute, Assistant Treasurer. Trustees of Permanent Funds of Both Societies: Alfred Bouditch, Lawrence Minot, Thomas Nelson Perkins.

Almost all the clerical work of the societies is done at the offices, 19 Milk St., where also the directors' meetings are held, the annual meetings, and where visitors are welcomed at all hours. The work of the president is chiefly done in his own rooms at the Hotel Westminster, where he still carries on the work of editing *Our Dumb Animals*, dictating his articles to

his amanuensis with remarkable lucidity and with wide grasp of the news of the world, which interests him in its bearing upon humane subjects.

### THE HORNET.

MRS. M. E. S. CHARLES.

No one cares to form a very close acquaintance with the hornet, and yet it is an interesting insect, and its nest is a marvel of insect architecture.

Hornets, like bees, are sociable creatures, and form colonies in which they live their brief lives. But un-

like bees their communities exist for one season only. On the approach of cold weather most of the hornets die and the home is deserted. A few hibernate and thus pass the winter.

Early in the spring a mother hornet, which may be known by the white patches on her face, comes out of some sheltered place, probably from under an old, decaying log, or from the heart of a hollow tree. After making a hearty meal of flies which she eats hanging head downward by her hind feet, and sipping the sap she finds dripping from scarred trees, she sets about finding a suitable location to build a nest and found a colony.

Some one has said that "the hornet was the first paper maker, and holds the original patent." The large, gray, strawberry-shaped structure certainly looks as if it were made of paper, and in fact it is built of a sort of papier-mache.

When the hornet is ready to begin building her nest, she visits the boards of unpainted barns and the tops of old gray picket fences, and chews off the partly-decayed fibers of wood. These she mixes with saliva from her mouth, and works into a paste or pulp, which she carries to the site which she has chosen for her future home.

In building a nest like the one in the illustration, the hornet makes a thread of pulp and attaches it to the branch. To the lower end of the thread she attaches, mouths downward, three or four little cells, also of

pulp which she has modeled with her jaws. In each cell she lays an egg. Around the cells she makes a globe-shaped covering about the size of an English walnut. Outside the first globe of paper she soon makes a second and a third, always leaving a hole on the under side for an entrance. Presently the first eggs hatch, and the hornet has to divide her time between building additions to her nest and feeding the baby hornets. She also continues to make more cells and lays more eggs. She feeds the young hornets chiefly on flies, which she catches on the wing. After undergoing certain changes the grubs first hatched become full-grown hornets, and immediately begin to help their mother by working on the nest and by feeding the younger ones, leaving their mother free to go on building more cells and laying more eggs. As each brood reaches maturity its members turn right in to help with the housework, and this they continue to do until cold weather comes. Then nearly all of the full-grown hornets come out and die, leaving the last brood of grubs to perish in their cells.

The large nest from which the accompanying photographs were taken was found on a maple tree, although some authorities claim that hornets usually select the willow as a homestead. The nest measured thirty-six inches in circumference near the top, and contained many cells holding eggs, and hornets in all stages of development. The nest was discovered early in September, but prudence forbade a very close examination at that time; and it was decided to leave it until midwinter when the hornets would all be dead.

The hornets have some relations who have a reputation almost as bad as their own. These are the wasps. Of these there are two kinds, the sociable

wasp and the solitary wasp. The sociable wasp builds its nest of the same material as that used by the hornet, but does not inclose it as the hornets do. These nests are usually found attached to the under sides of the roofs of barns and other outbuildings.

The nest of the solitary wasp is quite different, in that it is built of mud and has compartments entirely

shut off from each other. Each compartment holds a single larva, and the amount of food that it will need to enable it to develop into a full-grown wasp. This food invariably consists of small spiders. Where the mother wasp obtains these spiders is not known, but it is supposed that she embalms them with a fluid with which she is provided, and deposits them at the same time the egg is laid.

*Spiceland, Ind.*

### THE TRUTH OF IT.

RICHARD BRAUNSTEIN.

O happy world, do you know that sorrow  
Lies at the back of all,  
To cover each gay and glad tomorrow  
With a thick and sombre pall;  
That trouble is ever beseeching to borrow  
Altho he would lend his all?

O questioner, do you know that gladness,  
Is a conqueror, brave, of pain,  
That a loss to us is a moment's gladness,  
And a day of joy, a pain;  
That sin and death, disease and madness  
Wrestle 'gainst love in vain?

### DANGERS OF A COAL MINE.

JOHN H. NOWLAN.

A COAL mine is full of dangers. The roof may fall; at any time a flow of water may be found and many similar dangers meet the miner, but the greatest danger lies in improper ventilation, fire damp, choke damp, and dust.

The miner, no matter where he works, must have fresh air and have it constantly. A failure of the air for a few minutes will cause the death of all the men in the mine. A fresh supply of air must flow through all parts of the mine to remove the air fouled by breathing and blasting and to dilute the gases given off by the coal.

Coal was originally a deposit of vegetable matter which in the course of time has been covered to the present depth. Decaying vegetation always gives off gas and in the case of coal it is more or less imprisoned in the seams. This is the marsh gas and the other gases met in the mines today.

A microscopic examination of coal will show it to be full of minute pores and from these the gases escape into the mine workings. Marsh gas is lighter than air and is found near the roof. This gas is diffused in all directions and mixing with the air forms an explosive mixture. Fire damp is a general term given to any mixture of explosive gases and air.

Gas escapes most freely from the face of fresh-cut coal, where it sometimes collects in great quantities. When mixed with air at the rate of one volume of gas to five volumes of air (16.7 per cent) it will burn but produce no explosion. When mixed in the pro-

portion of one volume of gas to sixteen volumes of air (5.9 per cent) burning is attended by only a series of feeble impulses. These percentages are called the explosive limits of fire damp.

Marsh gas is not poisonous to the system but breathing air charged with a large percentage of it causes giddiness. This is caused by the air being deprived of part of its oxygen. It does not poison the system or deprive the blood of its oxygen as does the deadly carbonic oxide gas.

The impure air fouled in a mine by an explosion is called the after-damp. Incandescent carbon (carbon at a white heat) reduces carbonic acid to carbonic oxide. Coal dust in the air of a coal mine is often the cause of more loss of life than the original explosion. One-half of one per cent of carbonic oxide is fatal to life, yet fires will burn in it. It is lighter than carbonic acid, hence miners have been found dead sitting out of reach of the carbonic acid and their lamps burning brightly by their sides.

It is claimed that dust is sometimes the sole cause of an explosion, and in some dry mines various methods are employed to allay the dust, the principal one being sprinkling.

To avoid danger from explosives, Sir Humphrey Davy invented the lamp known as the Davy lamp. Flame is gas at a white heat. Sir Davy noted that a piece of cold iron held to a small jet flame issuing from a coal fire momentarily extinguished it. He reasoned that if the flame could be surrounded by cold iron it would not spread to the surrounding gases. He made a lamp surrounded by a fine wire gauze (28 wires to the inch). When taken where inflammable material is found the gas burns inside the lamp but is prevented from spreading by the gauze. If you have a gas jet hold a very fine wire gauze over it, turn on the gas, and hold a lighted match over it. The gas will burn above the gauze, but the metal will conduct the heat away and the flame will not pass below till the gauze becomes heated. Since then a number of lamps have been made, all having the gauze for the basic principle.

Ventilation is sometimes secured by means of natural heat but it is an unsatisfactory method if the workings are extensive. The oldest method was to have two shafts in one of which the air was rarefied by means of a furnace, thus causing an upward draught and drawing in air through the other shaft. While the furnace does not cost as much as other methods, and is not as apt to get out of order, yet there is great danger of firing the coal seam, and the air must be taken into the upcast some distance above the fire to prevent an explosion.

Fans are the commonest method of securing ventilation. The exhaust fan reduces the atmospheric pressure at the top of the upcast and causes a vacuum, thus causing the air to move through the mine toward that

point. By means of the blowing fan the air is forced into the mine, increasing the pressure, thus causing a current away from the fan.

Whatever system is used, the air is made to circulate through the mine by means of curtains and doors. Formerly the air was taken in at one shaft and out at the other after being passed through all the parts of the mine. But with increase of workings came increase of consumption of air. To the uninitiated it would seem that doubling the power would double the quantity of air, the airways, etc., being the same, but such is not the case. The power varies as the cube of the air, hence to double the air requires eight times the power.

The only economical way left is what is called splitting the air current, which means that the air is drawn from both directions of the airway. To illustrate, suppose a pipe ten feet long has a rope lying

in it and a force of one pound will draw the rope out in ten seconds. The velocity is one foot per second. If a hole be cut in the middle of the pipe and the rope grasped at that point the same force will remove it in five seconds as each end will be traveling one foot per second.

By placing the air shaft near the centre of the workings and drawing the air from both directions the ventilation is doubled without an increase of power.

Sulphur is present in almost all coal, usually in combination with iron.

Some faults throw the coal up or down several hundred feet, the most noted being the Whin Dykes of Scotland.

The three great coal fields of the United States are the Pennsylvania, the Illinois, and the Iowa-Kansas-Missouri.

One seventh of the coal of the United States is in Illinois, the area being 37,000 square miles of from three to sixteen seams.

The consumption of coal is greater for each decade than for all previous years.

The time may come when we will utilize solar energy directly, but we are now drawing on the stored energy of ages past.

Human life is cheap. The month of December 1907 has a gruesome record. Read the mine accidents.

Every one of these explosions was due to accumulated gas which could have been prevented by better ventilation.

The treatment of the laboring class, not alone in the coal mines, but in all the various industries, is one of the most convincing arguments of the Socialists. The number of killed and wounded in the "industrial war" on mankind exceeds the number of victims of any recent war. The time is coming, and though slowly yet not the less surely, when labor will gain better treatment. Let us hope that it will be gained peacefully.

### POOR LITTLE JACK.

HARRY B. BRADFORD.

It was a very pleasant sight to meet little Jack, riding up and down the sidewalk every fine morning in his little automobile. One would think, to see this

five-year-old, bright-faced boy, with such beautiful brown eyes and hair, that he had all he needed to make life's happiness complete.

Jack's parents moved into the flat next to ours, and in this way we became acquainted with the conditions in his life, which proved to be a great surprise to us. We could hardly believe that the mother of that dear,

bright-faced little boy could be so cross to him. She was extremely impatient and irritable.

As far as I could learn, Jack was a very obedient child, as these two following incidents show:

One day as Eleanor (one of Jack's playmates) came by, she found Jack just outside of a neighbor's front gate, crying. "What's the matter, Jack?" she asked. "My ball went in Tommy's yard," said Jack, "and mamma told me not to go in there." Eleanor recovered the lost ball, which was in plain sight, and restored it to the thankful owner.

Another time Jack appeared at our door with some car tickets, which he found near our gate, and naturally supposed someone in our house had lost them. Laura opened the door at his ring, and asked him in, but he said that his mother had told him not to go inside, and, holding up the tickets, he inquired if they belonged here. Laura's sister had dropped them and was glad for their recovery but little Jack could not come in to receive her thanks.

One day, while my wife and I were at lunch, in our flat, a surprise of the following kind came through the thin little wall which separated little Jack's home from ours. "You will ruin everything I put on you. Don't you know how to eat? Why don't you put your victuals in your mouth and not all over the tablecloth? You won't get any more lunch if you can't act better than that!" Then we heard a slap, and a spoon fell on a plate and little Jack was weeping very softly as if his little heart would break. "Now shut up your bawling, or get down from the table,—do you hear me! I can't eat my meals with you bawling all the time. Take your spoon up there and eat right or I'll take it away from you and you shall not have a bit of dinner. There you are again (another slap, on the hand this time, I imagined, as the spoon went smartly down on the floor)! Didn't I tell you which spoon you must use when you eat your soup? I never saw such a stupid child in all my born days. I wish I could have you eat by yourself and would never have to eat with you again!"

I imagined, by this time, little Jack's eyes were so full of tears that he could not tell one spoon from another, and that he would probably enjoy a meal of herbs by himself far more than anything such a mother could prepare for him. And this was a sample of little Jack's usual experience!

After the assault of this mother upon her only little son had subsided, my wife said: "If we had a pretty little boy like Jack, we would not treat him like that, would we, dear?" I replied, "I should rather hope not."

Little Jack is always very tastily and comfortably dressed, and has a nice little automobile in which to ride, but we can only say, when we think of him, "Poor little Jack," and do you still wonder why?

### RESCUING A FRIEND.

THAT the crow is a bird of more than ordinary intelligence, the following anecdote will clearly prove:

A miller saws two crows light upon his mill-pond. One obtained firm footing upon a cake of ice, but the other, less judicious in the selection of his landing place, pitched into some pulpy snow, from which he found it impossible to extricate himself. His companion immediately came to his rescue, and tried to help him out of the predicament. Finding, however, that this was impossible, he stopped, elevated his head in a position that denoted calm and mature deliberation, then chatted for a moment with his unfortunate comrade and flew off.

The miller decided that he would watch the conclusion of the whole affair. In about ten minutes the crow, bent upon the errand of mercy, returned with two others of his species, as first aid to the injured. The three put their heads together in consultation, flew around their imprisoned companion, examined his condition, and then by a joint effort raised him up and stood him on the ice. This being accomplished, they rubbed against him to warm him, brushed the frozen snow from his wings, and finally all departed together, the saved crow being in the center of the others, as though it was still necessary to watch after his welfare.

### SCHOOL FOR MOSLEM GIRLS.

MOSLEMS have never considered that women have many rights in the world other than to stay at home and do as the men say. Pretty closely confined to their houses and heavily muffled when they do appear on the streets, they are not a class that is likely to excite the envy of the women of nations where the spirit of freedom permits them to do as they wish and to go where they please. American and English women look with a good deal of commiseration upon the French girls who are kept, up to a certain age, under close restraint, but the life of the French girl is one of freedom as compared with the little Moslem houris who live in Turkey, western Asia, and on the northern coast of Africa. From time immemorial this has been the fate of the Moslem women; even as far back as the events related in the "Arabian Nights Entertainments" we see that this seclusion was imposed upon the female sex. The Mussulman does not think much of the woman who would mingle with the world and become interested in the world's affairs, and even the Koran has not much to say about the future state of women.

But an awakening is slowly coming about, owing to the closer intercourse that these Mohammedan nations are holding with other nations that are more enlightened. In Tunis, for example, a slight step is being taken toward the better education of the women; only a slight one comparatively, to

be sure, but that much. The truth of the matter is, the men of Tunis are now thrown in contact a great deal with the men of France, inasmuch as Tunis is a colony of France; a great many male inhabitants of Tunis go to Paris where they study, mix with the people of intelligence, and come to admire the intellectual qualities of the women of France. Naturally, then, when they return to their home, they are not satisfied to marry the sort of doll babies the Tunis women are, who are unable to keep pace with them in the matters that interest them.

So the French government and some of the wealthy Tunis papas have come to the conclusion that the girls may be allowed to learn a little after all, and a school has been established in the city of Tunis in an ancient and luxurious palace; a veritable Oriental fairyland, it seems to the Occidental with its great halls paved with flagstones of polychrome marble, lighted from many windowed and gilded cupolas. Here in this old palace one hundred little Tunis girls flit from chamber to chamber like the houris of the Mohammedan's paradise. They range from six to fourteen years. Two old sheiks, just such fellows as we learned about in the "Arabian Nights," with long white beards, and a few young women who act as instructors together with a directress, have charge of the school. The institution was opened as a council which teaches the pious works of the Mussulman. The two wise old fellows who have charge give instruction in the Koran, the elements of the Arabic language and the Moslem code of morals while insisting upon a spirit of tolerance. The rest of the curriculum is devoted largely to hygiene, domestic economy and needlework for which the young scholars show a great deal of taste. It is interesting also to note that the scholars show a great deal of interest in mathematics, thus retaining that aptness for a study that their forefathers, the Arabians, founded and gave us the principles of and from which has developed the most exact of all sciences. Only the daughters of the rich are found in this institution, for among the poor an educated girl is considered unmarriageable. And this is the attitude of Mohammedans in general toward education; in the main they are opposed to the spread of learning.—*Pathfinder*.

#### HILLS THAT TRAVEL.

THE formation of sand hills or sand dunes along the Atlantic seacoast of the United States is so frequent, that these eminences are common sights, especially on Cape Cod peninsula, the coast of New Jersey, as well as in the vicinity of Cape Henlopen, Cape Henry, and on the beaches of North and South Carolina. It is perhaps unnecessary to say that the dunes are created by the action of the wind upon the sand, which is washed up by the waves. They are termed fixed or

wandering dunes according to their formation; for unless one is sufficiently covered with vegetation, the force of the wind currents continually changes the position of the sand to such an extent, that the hill travels in the direction of the prevailing breezes at a rate depending upon their force and constancy. Measurements which have been taken in southern New Jersey, as well as Massachusetts, show that in a year a wandering dune may move from 15 to 20 feet. Unfortunately, the sand is continually shifting to such an extent, that there is little opportunity for seed which may be deposited upon the surface to germinate; and even where shoots appear above the surface, unless protected in some manner they are soon killed by being covered over or cut off by the contact of the flying sand particles. Consequently, the movement of a shifting dune is seldom checked until it has changed its location to such a point that it is less exposed to the wind current, when it may become fixed by the growth of vegetation upon it. The formation of the coast dune has a parallel in the sand waves, as they are termed, which are found in various localities inland, since they are due entirely to the action of the wind currents on loose material of this kind: and where the topography is favorable, so many waves are formed that they have been termed sand seas, as one can see ridge after ridge reaching backward for miles, and bearing a striking resemblance to the waves of the ocean. Not only in the United States are to be noted examples of this kind, but in some portions of the Sahara in Africa, and especially in the Turkestan desert, although the valley of the Columbia River in Oregon and Washington probably contains as remarkable illustrations of the action of the wind as any part of the world. Picturesque as is the view along these sand ridges, unfortunately they afford a perplexing problem for residents in this vicinity to solve, as they frequently overwhelm the railroad tracks, and would engulf buildings if steps were not taken to prevent their encroachment. For a considerable distance the tracks of the railway owned by the Oregon Railroad and Navigation Company are built through this valley between the Dalles and Wallula. Such is the movement of the sand, that on a windy day it is literally impossible to keep the tracks clear of the drift by means of shovels, and unless extraordinary measures were taken, the railroad would soon become buried to a depth of many feet.

An excellent opportunity has been given in the Columbia Valley to study the exact effect of wind currents blowing in different directions, since the high bluffs cause eddies and miniature whirlwinds, which also act upon the sand, as well as what might be called the direct currents. The changes made in the sand waves by various forms of barriers have also been carefully studied, and as a result some valuable data have been secured. It has been found that when the

wind sweeps over a free surface of drifting sand, it acts about equally throughout; but an obstruction of any kind, such as a log or a bunch of grass, at once modifies the action of the wind. A solid object increases the force of the wind around the sides, and hence the sand is excavated. In the lee of the object the sand will accumulate. If two such obstructions are near together, a channel is formed between them, and once formed deepens with astonishing rapidity. The carrying power of the wind increases much more rapidly than the increase in the velocity. Consequently, any increase in the velocity is immediately noticeable in the increased erosive power. The erosive power of the wind is not identical with the carrying power, for in the first place the wind overcomes cohesion, and in the second place it overcomes weight. If the velocity of the wind decreases, the sand previously held in suspension is deposited. Thus if a solid fence is placed upon the sand at right angles to the wind, the sand is excavated in front. The wind, unable to proceed, is divided into currents in all directions. Those going downward scoop out the sand, thus forming a drift a short distance in front. This increases until its height equals that of the fence, when the wind, no longer meeting with the obstruction, allows sand to be deposited in this channel, and it fills up, covering the fence. Similarly, at the ends of the fence the wind currents are increased, and the sand is scooped out. If the fence is raised so as to allow a space beneath, the sand is rapidly scooped out below. The same result occurs beneath buildings, trestles, or other works which allow a space beneath, through which the wind rushes with increased force. If, however, the obstruction is not solid, but more or less open, as a pile of brush or a bunch of grass, the action is entirely different. The wind passes through the obstruction, but with decreased velocity; hence sand is deposited within the obstruction. No excavation takes place in front or around the sides. If the obstruction is stiff and inflexible like a sand fence, the sand is deposited on both sides, the windward slope being gradual and the lee slope more abrupt. If the obstruction is flexible like a bunch of grass, most of the sand is deposited in the lee. Of course, there are all gradations between the two classes, and various circumstances may modify the usual action.

It has also been ascertained, that when the wind is blowing up an incline, the surface velocity increases with the steepness, but when the wind blows down a slope, eddies form, which usually produce a current uphill at the surface. Thus it happens that while small bodies can be blown uphill easily, it is not often that they are blown down hill, but must fall from their own weight when the slope is steep. The fact that the velocity of the wind at the surface on the windward side of a dune increases with the slope results in producing a normal incline, which represents a bal-

ancing of forces. Usually this incline is quite gradual compared with the lee side of the dune, where the slope is the greatest at which the sand will remain in place—about thirty degrees.

The Columbia River, which deposits the sand along the valley it traverses, often rises to a height of fully 60 feet during the freshet season, carrying down stream an immense quantity of fine silt, which is more mobile than the ordinary sea sand, as it consists of very fine rounded grains, easily combined into drifts by the strong winds which sweep through the valley. The movement of the wave is of course caused by the movement of the sand grains over its crest. As the direction of the winds is generally upstream, the waves have a notable uniformity, and at times attain such a height that actually trees 40 feet in height are sometimes buried to the tops. An analysis of the sand shows that it was very fertile when sufficiently irrigated, but the high winds absorb so much moisture that it is impossible for vegetation to take root in the dry season.

In fighting the sand sea, several methods of checking the movement of the sand have been tried, some of them with notable success. The first and most extensively used is the "sand panel." A panel consists of two boards, 1 inch thick by 12 inches wide, and about 20 feet long, nailed to sharp stakes at each end. The stakes are driven into the sand, so as to make the panel stand up with its length oblique to the wind, and the leeward end away from the track. The wind is thus made to carry the sand along the face of the boards and away from the track. While the wind is blowing hard, the panels must be closely watched, as they soon become undermined and fall down, or if not properly placed, are covered up. The second method can be used only where there is a considerable level space on the leeward side of the track. A vertical wall of inch boards from 10 feet to 20 feet high is built a few feet to windward of the track, with an opening of 3 feet or 4 feet at the bottom. The wind striking the wall is turned down, and passes with increased velocity through the opening at the bottom, carrying the sand with it, but soon loses its force on the lee side of the wall, and deposits the sand just across the track. From there it must be occasionally removed by teams or some other means.

A third method, invented by Mr. J. P. Newell, is a modification of the panel plan, but is intended to be of permanent construction. A tight wall from 10 feet to 16 feet high, composed of two planes, the upper inclined toward the wind and the lower away from it, is built between the track and the approaching sand drift. The upper plane deflects the air current strongly downward, and the lower one throws it down so that it cannot undermine the walls, but is turned against the sand bank. The wind is thus made to carry the sand along the wall to the end, which is located at some

point where the natural features will prevent the sand from doing any harm. Such a wall has protected one of the worst places on the road for three years. The movement of the sand has also been partly obstructed by the planting of trees at right angles to the direction of the waves. The trees, which are of a variety which will take root in the formation, are usually set out in two rows separated by a bank of sand, but the formation about them must be artificially moistened to keep them from dying.

As the photographs show, however, there are places where apparently no protection is sufficient to keep the sand from covering the right-of-way. At one point where the track passes close to the wall of rock forming one side of the valley, a force of men and teams is almost constantly employed with shovels and scrapers as illustrated.

As far back as 1832 the people of Massachusetts realized the necessity of preventing the movement of sand dunes near some of the coast towns, to prevent the latter from being literally overwhelmed. The principal form of protection has been the planting of beach grass in places where the wind currents are not too violent to check its growth, keeping the dunes from forming. Some of the dunes have also been "fixed" after formation by planting the grass, then protecting it from the wind by covering the windward side of the hill with brushwood. On a fixed dune certain kinds of trees will grow to maturity. This is illustrated by the forests in New Jersey and Virginia, some of which extend almost to the water's edge. In these States, however, are places where the dunes have reached a height of over 100 feet, and have literally buried growths of large timber to such an extent, that only a few feet of the trees can be seen projecting from the sand here and there.

## CURRENT COMMENTS

Helium, the only gas which up to a few weeks ago had not been liquefied or solidified is no longer unique in that respect. Professor Olmes, of Leyden, has solidified it. Solidified helium will, no doubt, prove the coldest thing in the world, colder even than liquefied hydrogen.

And so, "Old Glory" is to be subjected to "an operation," at least it seems that the addition of the forty-sixth star, signaling the admission of the State of Oklahoma, will soon be made to the United States flag. The General Staff of the army recently adopted an amendment to the army regulations authorizing the Quartermaster General to provide another star. As a usual thing, the addition of an extra star or two has not disconcerted the old flag in the least, but the ground has become so thickly covered with stars that it is said that this new one will necessitate an entire rearrangement of the field of the flag, and so the Navy Department, under the law,

will supply the new plan. As soon as it acts, every existing United States flag in the Service will be withdrawn and the new flags substituted. By act of Congress, April 4, 1818, the United States flag was to consist of thirteen horizontal stripes and twenty stars in a blue field; one star to be added to the number on the admission of each new State, the addition to be made on the fourth day of July succeeding such admission.

The difficulty over the registration of Hindus in the Transvaal on account of the requirement that they give finger prints of all the fingers of both hands, a means of identification used only for criminals in India, has been relieved by the Transvaal's withdrawing the obnoxious form. The Hindus who had been imprisoned for refusing to register have been released and given their promise to use their influence to get their fellows to obey the law as amended. The dispute in South Africa had a very bad reflex influence in India.

### SENATOR PROCTOR.

During its present session the Senate has been called upon to mourn the death of five of its members—Senators Morgan and Pettus, of Alabama, who passed away during the recess; Senator Mallory, of Florida, Senator Latimer, of South Carolina, and now Senator Proctor, of Vermont. Redfield Proctor, was born in Cavendish, Vermont, nearly seventy-seven years ago, graduated from Dartmouth in the class of '51, finished his education at the Albany Law School, and settled down to the practice of law in Boston. At the outbreak of the Civil War he enlisted, during his service rising to the rank of colonel. Returned from the war, he became interested in the marble business. In his hands the business expanded until he controlled the greatest marble quarrying firm in the world.

He began his career in politics by acting as selectman of his town. Thence he rose until he was Governor of Vermont. In 1889, President Harrison made him his Secretary of War, in which post Proctor instituted our present system of coast defense, abolished Sunday inspection which had made Sunday the hardest day of the week for the soldiers, and started a system of examinations for promotions which still persists. Toward the close of 1891 he succeeded George F. Edmunds as Senator from Vermont, and since then had been thrice reelected. Senator Proctor probably did more to bring on the war with Spain than any other one man. After the destruction of the Maine in Havana Harbor he visited Cuba to see with his own eyes the condition of affairs there. On the seventeenth of March, 1898, in simple, straightforward language, without exaggeration and without passion, he told the Senate what he had seen. It was a speech which made votes, votes to help the Cubans.

The late Senator was the sort of employer who postpones or makes unnecessary the advent of socialism. His firm furnished its employees with model tenements at low rent, and everyone can have a garden patch for the asking. It provides a well equipped hospital and district nursing free to employees and their families. The twenty-five hundred workmen are covered by accident insurance at the cost of the company, and without expense to the men. The company stores are on a co-operative basis: a committee of the men takes an active part in their management, and the entire profits from them are distributed to the employees. The Senator, likewise, has given a library and a Y. M. C. A. building for the use of the employees. Last year he gave his

State a sanatorium for tuberculosis. Redfield Proctor, jr. the Senator's son, and the present Governor of Vermont, is said to be anxious to succeed his father in the Senate.

### THE WORK OF PARLIAMENT.

The woman suffragists won an empty victory in the House of Commons recently when the bill to give women the suffrage passed its second reading by a large majority, but was referred to the committee of the whole, whence it is not likely to be recalled, instead of to a standing committee. The bill was introduced by a private member, and the Liberal Government neither advocated nor opposed it. In the division twelve members of the minority voted for the bill and six against it. On Thursday Mr. Asquith introduced the licensing bill which the Liberals had promised. The bill proposes gradually to reduce the number of public houses until at the end of twenty years there shall be one saloon for every seven hundred and fifty persons in cities and one for every four hundred persons in country districts. Such limitation would close about one-third of the public houses—that is, thirty-two thousand out of less than one hundred thousand. In England a license is regarded as a vested right, which should not be extinguished without compensation. The Government proposes that the other license holders shall contribute the money to reimburse the men whose licenses are extinguished. But at the end of fourteen years, licenses would cease to be vested interests, and would belong to the state as they do here in America. The bill also extends local option and Sunday closing. Local option is to govern the issuance of new licenses, and a majority of the parochial electors will be sufficient to prohibit the granting of a license for a period of three years, at the expiration of which a new vote may be taken. Mr. Asquith proposes that outside of London public houses should sell liquor on Sunday only one hour at midday and two hours in the evening. He does not believe England is yet ready for absolute Sunday closing. On the introduction of the bill brewery shares decreased \$160,000,000 in value on the stock exchange. The brewery interests are tremendously strong in England. More than half a million men and women are in the direct employ of the liquor business and another million receive indirect employment. The measure will be the center of a hard fight.

### THE TARIFF COMMISSION IDEA.

Senator Beveridge of Indiana, has introduced into Congress a bill to establish a permanent non-partisan commission to investigate all questions related to the tariff, as the cost of production in foreign countries, the comparative wages paid, and so on; and generally occupy a position relative to the tariff similar to that occupied by the Inter-Bureau of Corporations in regard to business. Senator Beveridge's bill provides that the Tariff Commission should be composed of seven members, three of whom should be identified with producing interests, one member to be a lawyer who has made a special study of customs and tariff laws, one a man with special experience of our tariff laws, one familiar with foreign commercial conditions, and one an economist and statistician who has studied prices and cost of production. The commission would simply report the facts to Congress; it would not fix or even suggest rates. That power would be left in the hands of the Senate and the House. Under the present tariff there are every year an average of thirty thousand cases in which there is a question as to

the class in which imports belong. There appears to be neither rhyme nor reason in some of the present classifications. Buttons and stoves are in the same class; so are railway cars and enameled portraits, cannon for war and bronze crosses for churches, bullets and buggies.

Senator Beveridge points out further that when the present Dingley tariff was drawn the rates fixed by the House and the Senate committees differed in many cases by one hundred per cent, in some cases even more. The House Committee, for instance, proposed a duty of one-half cent a pound on railway fish-plates, the Senate Committee one of four cents, eight times as much. The conference committee, which reconciled the two reports, sometimes disregarded the recommendations of both House and Senate Committees; all of which facts suggest that our tariff is at least not scientific. Senators and Representatives have not time to do the work needed for a scientific adjustment of the tariff, so Senator Beveridge argues, and cites an account, by Senator Vest, of the work of the Senate Committee which drew up the Wilson tariff of 1903-4. Three of the conferees, Senator Vest said, broke down under the strain of the work. He said of himself, "I have never been able to recover from the exhaustive labor to which I was subjected during that terrible struggle."

The present German tariff was the result of six years' work of investigation by thirty expert tariff commissioners. Japan, France and other countries have adopted a similar plan in dealing with the subject. The plan for a permanent non-partisan tariff commission is widely advocated in this country by manufacturers' associations, chambers of commerce, and boards of trade, among them such bodies as the National Association of Manufacturers, the American Meat Packers' Association, the Massachusetts State Board of Trade, the Baltimore Chamber of Commerce, and the Board of Trade of Chicago.

### THE PRESIDENT ON EDUCATION.

President Roosevelt, in a talk to members of the National Educational Association last week, preached to the nation what Booker Washington is preaching to the Negroes, "I trust," said Mr. Roosevelt, "that more and more our people will see to it that the schools train toward and not away from the farm and the workshop." The President went on:

"In our education we have tended to proceed upon the assumption that the educated man was to be educated away from and not toward labor. The great nations of mediaeval times who left such marvelous works of architecture and art behind them were able to do so because they educated alike the brain and hand of the craftsman. We, too, in our turn must show that we understand the law which decrees that a people which loses physical address invariably deteriorates so that our people shall understand that the good carpenter, the good blacksmith, the good mechanic, the good farmer, really do fill the most important positions in our land and that it is an evil for them and for the nation to have their sons and daughters forsake the work which if well and efficiently performed means more than any other work for our people as a whole.

"Machinery is freeing men from the least intelligent work of the hand. The men who run the steam shovels at Panama work with their hands, but work with their brains, too. To put the thought of the mind into concrete shape through the work of the hand is the ideal of work. Physical work that does not combine work of the head with work of the hand is in so far bad."

# THE INGLENOOK

A WEEKLY MAGAZINE

PUBLISHED BY

BRETHREN PUBLISHING HOUSE, ELGIN, ILL.

Subscription price, \$1.00 per Annum, in Advance.

The Inglenook stands for material and spiritual progress. Its departments are: Literary, Editorial, Home, Cream of Magazines, World News.

Its qualities are: Good Sentiment, Moral Convictions, Inspiration.

Its purpose is: To safeguard home life by supplanting and counteracting bad literature.

Its scope of matter is: Scientific, Religious, Educational, Philanthropic, Economical, Sociological and Financial.

Its field is: The World.

Liberal commission given to agents. Sample copies are given upon request. When changing address give both old and new addresses.

Entered at the Postoffice at Elgin, Ill., as Second-class Matter.

## HOW THE WORLD GROWS BETTER.

No. 2.

ONE of the strongest evidences of ethical and religious development is found in monogamy. A few thousand years ago polygamy was universal and monogamy was almost wholly unknown, while now, the ruling nations of the world all practice monogamy, and along with this has come the liberation of woman. She is no longer used arbitrarily for the lusts of man's flesh, not bought and sold, not held in ignorance and housed in harems, not looked on as an inferior being, and not held as a mere adjunct to successful housekeeping. She has a deep and abiding place in man's heart. She is adored. She is taking her stand alongside of man in all the battles of life and her courage, conviction and strength is no longer questioned. Indeed she has championed some national reforms, as is instanced by slavery and temperance. With all the new forms of vice which pester us today, there is no doubt but what there is more real, soul affection between man and woman now than there has been for many centuries past.

Along with this advance in the moral fiber of man has come another evidence in favor of a better manhood. This evidence is regard for human life. Massacres are unknown now, but there was a time, even long this side of the Roman era, when captives were killed or sold into slavery. The Roman galleys furnish an example of ancient cruelty. Today the Red Cross of the world alleviates pain on the battlefield and opposing armies give medical attention to those who fought against them. Weapons of warfare have undergone a change so as not to be so cruel as they were formerly. International arbitration has discarded useless punishment and barbarous treatment to enemies. Civil courts furnish a free defense for criminals. Dependent people are cared for today by the State. Penal institutions, instead of being one continued series of torture and shame, are being made re-

form schools in which the inmates can prepare for usefulness in life. Everywhere, regard for the life of young and old, rich and poor is being shown, and the Humane Society of Boston has extended this kindness even to the brute world. Yes, since Christ instilled his spirit into the race and man allowed woman to occupy her rightful place in his heart, he has made rapid strides in his own advancement. Freeing woman has resulted in his own emancipation. And there is yet room for development.

## INGLENOOK WEEK.

To all who are not now on the subscription list of the INGLENOOK, the week of May 4 to 9 inclusive will be a memorable one.

We propose to present three offers of such unusual value as will make it next to impossible for any one acquainted with the merits of the INGLENOOK to be without its weekly visits. If your friends and neighbors have not already subscribed for this splendid magazine send us their name and address and we will mail them a sample copy. Don't fail to call their attention to INGLENOOK Week, and its splendid opportunity to secure a week's magazine on such liberal terms.

## ANOTHER ORPHAN CALLED FOR.

It is with profound gratitude that the editor records the fifth call for an orphan since the Christmas number of the INGLENOOK. This time it is Michigan that supplies the home. Letters from every direction indicate that the work is being watched by our readers. Parents have sent us encouragement, orphans have sent us letters and children who have homes are also interested in the work.

As soon as possible we shall publish the pictures of the children and those who have given them homes. It takes a while to reduce this new work to a working basis but we will soon be able to act more promptly in this matter. The work is a worthy one and the need for workers is great.

## THE TWO ARTICLES ON TRUSTS.

DURING the past few months we gave two long articles in the Cream of Magazines which dealt with the building of trusts. The first dealt with street railway trusts, the second with the tobacco trust. There will be no more articles of that kind during the remainder of this year, and we urge every one who wishes to know something of trust manipulations to read those articles if you have not done so already. Those two articles were valuable reading and dealt with the subjects in such a masterly way that it will be a rare chance to learn so much on such subjects in the future. We could have given more but feel that the question has been treated fully enough.

**PEACE SOCIETIES IN OUR COLLEGES.**

THE Intercollegiate Peace Association (Professor Elbert Russel, Richmond, Indiana, secretary) is arranging, as a part of its work this year, a number of oratorical contests. From a circular on the subject, we learn that state oratorical contests will be held in Indiana, Ohio, Illinois and Michigan, if five or more representatives enter the contest for each State. Each institution belonging to the Association may be represented by one contestant, a bona-fide student of the institution. The orations must deal with some phase of the subject of international peace and arbitration, and must not be over eighteen minutes in length. The number of contestants at any state contest will be limited to six. If more than six institutions enter representatives, district contests will first be held to determine who shall participate in the state contest. The interstate contest, in which the winners in the state contests will complete, will be held in connection with the annual convention of the Intercollegiate Peace Association in May. Three judges will pass upon the merits of the orations. The prizes in the state contest will be \$30 and \$20 for the first and second best orations; in the interstate, \$75 and \$50. The following subjects, we venture to suggest, would be very appropriate for treatment in these orations: "The Origin and Growth of the International Peace Movement," "The History of Arbitration," "The Present Practicability and Urgency of Universal Obligatory Arbitration," "The First Hague Conference and its Results," "The Treaties of Obligatory Arbitration Already Concluded," "A Periodic Congress of the Nations," "An International State Necessary and Practicable," "The Results of the Second Hague Conference," "The Decline of War," "Commerce and Peace," "The Interparliamentary Union and its Work," "The Duty of the Churches in the Peace Movement," "Settled Peace the Measure of Civilization," "The Crime of the Present Rivalry in Armaments," "Limitation and Reduction of Armaments an Immediate Duty," "The Growing Unity of the World," "The Hague Court," "Woman and War," "The Substitution of Law for Violence," "War a Survival of Barbarism," "Great Armaments not a Guaranty of Peace," "War and the Laboring Man."

The *Peace Advocate* gives the Above information from which we learn how some "peace" people are employing their college talent. We suggest that other schools take up the question of international arbitration and spend some energy on the question of the hour. It is one thing to belong to a peace organization, but it is quite another matter to believe in peace strong enough to take a hand in advancing the principle.

The intellect will make as much development in the study of such a question as it will in any study outlined in the college course. At least international arbi-

tration and the uselessness of war could come in as elective studies, while theses and literary societies could give a place for the consideration of these questions.

**WOMEN SMOKING CIGARETS.**

ONE of the fashionable cafés of New York City has announced that its dining parlors can be used as a smoking room by the ladies who dine there. It is becoming popular among a large per cent of the wealthy society women of the city to puff away at a cigaret or two, while at the dinner table. The custom has been introduced from Europe and American womanhood seems to be demoralized enough to catch up the filthy habit as a matter of style. Every lover of righteousness ought to abhor and denounce the incoming evil, for if a mother takes only one such liberty in belittling her virtue, the daughter will take a dozen worse liberties than the mother ever dreamed of taking. This is the nature of sin. It calls for more and more, but is never satisfied. With Sunday gone, with open saloons and foul theaters open and filled on Sunday instead of the churches, with mother smoking cigarets and carousing around at night with a "gentleman friend," with the daughters living in such an atmosphere, and the houses of prostitution licensed by the public consent, how can we expect the city to reform? And since city ideals finally mould rural ideals, what of the future? This is no time for Christian people to be asleep.

**CURBING SPECULATION BY NATIONAL LEGISLATION.**

IN addition to the proposed amendment to the Constitution of the United States prohibiting the making and selling of liquors for beverages, another bill is also under consideration for the curbing of speculation on stock exchange. While neither bill will be taken very seriously by Congress yet it shows that the heaven of righteousness is not dead in the nation.

Some of the vilest persons often favor the introduction of such bills simply to make a favorable showing to the moral element of the country and appease the oncoming wrath of an outraged constituency. It is said that President Roosevelt is urging the bill against so much gambling. Hughes, of New York, has made himself clear on the question and Bryan has been preaching this doctrine for several years past. The common people ought to urge such measures upon their representatives. A letter to your congressman may turn the tide in his mind and secure his influence in favor of moral reform.

You cannot touch men as long as you think of them as masses.

## All Wrong

Martha Shepard Lippincott

The stranger is given the kindly smile  
And words that will cheer the heart,  
While those in the home oft receive the frowns  
And words that cause tears to start.  
Oh! why should such cruelty ever be,  
And hearts e'er be made to mourn,  
Where love should be making the household glad,  
And smiles for the loved be worn?

'Tis wrong, your ill humor to give to those  
To whom you should be most true,  
And love, with a tenderness ever kind,  
As all noble souls would do.

Some day, when cold death takes your own away,  
And pardon you long to gain,  
Those lips that you wish could again forgive,  
Must silent fore'er remain.

Oh! then what sad anguish will fill your soul,  
The past you will so regret;  
The sting and the sorrow your words have caused  
You never can then forget.  
And how you will wish you could try again  
And be to your loved more kind;  
But only one life with our loved we live,—  
This fact, you will ever find.  
Box 3, Moorestown, N. J.

## How Two Girls Learned to Sew

Elizabeth D. Rosenberger

"GRANDMA is coming!" shouted Christine ecstatically. "Oh, Ellan, Grandma will be here this evening!"

"My, but I am glad!" exclaimed Ellan. And their mother said, "It seems too good to be true. It is ten years since she last visited us, and how she helped me then! You girls had the scarlet fever and I don't see how we could have managed without her, she nursed you day and night."

Grandma's promised visit was heralded with delight by every one in the household. And when she came she was warmly welcomed by all. In a few days the little girls kept coaxing her to come and live with them always. She was so pleasant, so interested in their doings that they fairly grudged the time spent away from her side. She looked critically over Ellan's sketches, and gave her suggestions that were helpful, while she warmly praised her efforts. She was never tired of listening to Ellan's music, it made no difference whether she sang "School days," or that sweet old hymn, "O love that will not let me go," Grandma liked them all. And she thought this Ellan's voice was even sweeter and clearer than her own Ellan's voice had been when she was a girl.

So they were having lovely times together. One morning Ellan said, "The white sale has commenced,

mother, and I need just everything, why can't you and Grandma do some shopping these days?"

"Me, too," announced Christine cheerfully. "I must look all through the wardrobe to find a whole underskirt these days."

"Perhaps we might go," answered their mother, hesitatingly, "but it does seem too bad that your muslins wear out so soon. I had hoped to escape this bargain sale, but if you must have new things I may as well go and see about them."

The girls hurried away to school. Grandma was sprinkling the clothes, preparatory to ironing them. She folded up a white petticoat from which the ruffle was torn in many places, and the lace was, so to speak, disintegrating, in other words, it *was out*, for even the pattern could not be traced. "How long have you had this?" she asked.

"About a year," answered her daughter Ellan.

"And this?" holding up a gown which had that tawdry, thin, unfinished appearance which goes with cheap, marked down clothing.

"We bought that last summer."

Grandma made no comment. For that matter she seldom did advise or criticize unless she was urged to give her opinion. And her daughter commenced

planning for a day's shopping on State Street, in Chicago.

Grandma ironed all morning. As she laid away one article after another of cheap, flimsy underwear, her sturdy independence rebelled at the idea of her grandchildren wearing such things. "Ellan, why in the world do you put up with it?" she asked.

"Put up with what?" inquired Ellan, who had forgotten about the white sale and was thinking about something else.

"Such stuff as this for underwear, when there are three of you here to sew, and a good sewing machine in the little sewing room upstairs."

"Oh, well, it's cheaper to buy things ready made," said Ellan weakly.

"Yes, it looks it," said Grandma, showing the raw edges and ugly seams of a garment she was ironing.

"Well, the girls never learned to sew," faltered Ellan apologetically, "and I have all I can do without sewing."

"Yes, my dear, I know, but that is the most serious part of the difficulty. Do you remember how I taught you to sew?"

"I believe it was before I learned to walk, for I cannot remember the time when I could not sew. But, mother, I loved to contrive clothes for my doll. My girls are so different, they hate sewing."

Grandma was silent. Perhaps that was one reason they all loved her so, she was tactful. And she could bring things to pass without antagonizing the entire family. But that afternoon she went shopping. She bought some remnants of cambric and linen and other white fabrics, also some beautiful patterns of laces and embroideries. Last of all she bought two pretty work-baskets fitted out with needles, thread and scissors and thimbles. After tea that evening she took Christine and Ellan with her to her room, and showed them the white materials she had bought.

"How perfectly beautiful!" said Christine. "Is it for a shirtwaist?" and she held the piece of linen closer to the light.

"What a lovely dress this would make," said Ellan, as she looked at the nainsook.

Then Grandma unfolded her plan and showed them the sewing baskets. "It is all yours if you earn it. Here are patterns and finishing braid. This is to make new underwear for you. I want you to sew about two hours each evening. I'll direct you and teach you, and we'll let other girls attend the white sale this year."

"Agreed!" said both of the girls, content in the thought that any task must be delightful, if Grandma superintended it.

And how they enjoyed learning to sew. Grandma showed them how to cut out the garments, how to make French seams so that there were no raw edges anywhere. Everything was dainty, neat, and well

made, so different from the lavishly trimmed, furbelowed underwear fashioned on flimsy lines to which they were accustomed.

Grandma said, "I want you to know how to sew, then you will not be compelled to wear ill-fitting, ill-made things. More than that, each one of you must take pride in your own mending and repairing."

So she taught them how to mend their kitchen dresses, so that the patches would be as unobtrusive as possible; taught them to darn stockings and mittens. And each of the girls made herself a shirt-waist suit before Grandma went home, and proudly wore it as evidence of the fact that she knew how to sew. Christine said, "I am rather envious of the little bride in Mother Goose who was to eat strawberries and cream, and 'sit down on a cushion and sew a long seam,' for I do like to sew."

## HOW RUGS ARE MADE FROM OLD CARPETS.

D. M. HOLLOPETER.

I WONDER how many readers of the INGLENOOK know of what value their old carpets are after they have been discarded as "no good." Perhaps it may be interesting to some to know that pretty fluff rugs are made from old carpets.

Being hand-made, they command fancy prices, and are in demand, especially by the wealthy and aristocratic classes. However, anyone having old carpets can have them made into rugs—rugs that are exclusive, that add an individuality that only your own carpets can give when made into rugs.

By permission of the Rockton Rug Works, of Rockton, Pa., I take the following from their publication, "Rugs and Carpets":

"It is hard to realize the beauty of rugs made from old ingrain and brussels carpets, unless you have seen them. We cannot do you justice by trying to tell you how nice they are; therefore, we will not attempt it. We simply ask you to send us a trial order.

"It is not necessary to use extra good carpet for these rugs, although the better your carpet, the nicer the rugs will be. Ordinarily, when carpet is not fit for the floor, it makes very good rugs. A wool ingrain will make a much better rug than a cotton ingrain.

"As rug making is an art in itself and very few people have an idea of how it is done, we will briefly outline the process fluff rugs go through.

"The carpet is shipped by freight to the factory, just as it comes from the floor—about as full of dust as it is possible to be. As soon as this carpet is received, it is given an order number and passes to the cutting department. Here it is ripped apart, folded, put in a machine and cut into strips, usually about one inch wide. After leaving this machine it goes to the fraying and raveling machine. And during this process, both edges are cut and raveled, leaving a

heavy fringe, on each side of the strip. During the above journey most of the dust and dirt has been taken out, but to make the rugs sanitary, and remove beyond a doubt any disease germ that may be lurking in the old carpet, the strips are sent to the cleaning department. Here they are put in a vat and thoroughly washed and cleaned in water. After drying, these strips go through a cleaner that eradicates all dust, lint, etc. Besides being sanitary, this process revives the old, faded colors and gives the strips a 'fluffy' appearance.

"We next go to the weaving department. The strips, are woven in, in such a manner that the fringe on both edges of the strip shows through the warp, leaving a beautiful, fluffy surface on each side of the rug, making the rug from one-half to three-fourths of an inch thick. After the binding and fringe are woven in the rug is ready for the finishing department, where it is clipped and cleaned ready for shipment.

"The old, dirty, dusty carpet that came in a short time ago has been transformed into a pretty rug that will beautify the home."

#### GARDENS AND FLOWERS.

MARCH is the month of getting ready. And as getting ready is the first step toward actually beginning, I take it that the "well begun" which we are told is "half done" really applies to this preparation rather than to the garden work itself, which does not come until a little later.

Therefore get ready thoroughly. It will make the greatest difference in your garden and in you, too—in your garden because the things will do better and look better for being in the right places, rightly planted and tended—in you because twice the results will be accomplished with half the labor, and you will not get tired out and discouraged, and the garden enthusiasm will not gradually ooze away from you, leaving you a growling garden cynic by the summer's end.

Every individual has a different way of doing any given thing, and naturally this is as true of gardening as it is of anything else, so it would be preposterous for me to suppose that any hard and fast "directions" which I might give—but which I am not going to—would be followed to the letter. But in a general way I think I may be able to help some—by "suggestion," leaving each to make his own rules, if rules he wants.

To the beginner in gardening, let me say earnestly and first of all, *establish limitations*. Do not let your catalog enthusiasm swamp you with a multitude of things about which you have no idea, to say nothing of lacking room for them in the garden's allotted space. *Everything* looks beautiful in the catalog pictures nowadays, and judging by the descriptions everything is beautiful, with each indeed lovelier than the

last. Beware, therefore, the beguilements of the nursery catalog, and insure yourself against its seductive pages by fixing at the outset upon a certain definite number of things which you will have in your garden, and then let nothing induce you to add even one more—not until another year at least.

In this way, you will find it possible really to observe the plants which you have and to learn something about them, how they should be taken care of, where planted, and how treated to get the sturdiest specimens and the most blossoms.

On the other hand, I should have enough kinds to be worth while and not build all my hopes upon nasturtiums and sweet peas. Of these there is never a dearth in the land, and as there are other things quite as easy to grow, it would seem that a few intrepid spirits might dare to venture into that wilderness of the unknown which is represented by something else than sweet peas and nasturtiums.

With perennials a most attractive all summer—and all spring and autumn, too, for that matter—garden may be made by taking a variety for each month, and this seems to me an equally good method of governing one's choice in annuals. A dozen are not too many—and they are enough.

A dozen kinds of perennials will extend the period of blossom in the garden almost through the entire year, and this extended bloom is, of course, one of the first things to be thought of in planning a flower garden. Annuals cannot be ready for blossoming quite so soon as the perennials, and we do not indeed expect it of them, neither will they bear up so late in autumn under the wintry blasts, but by giving them a very early start in the hotbed or in flats indoors, they will be ready to go outside as soon as danger, from frost is passed, and by May some will begin their display, which you can keep up as long as you choose—for six months usually, weather permitting—by sowing seeds at intervals all summer, outdoors where the plants are to grow.

Under this rule of selection, you will find that you have a very complete garden, and it is a simple matter to add a new thing each year if you feel that you must have more.

The choice of twelve from such an embarrassment of riches as are offered is a staggering task, and I know what strength of mind it is going to take to keep from wading in and ordering everything in sight—therefore the following lists are given. If they help any one over this crucial period, they will not have been prepared in vain. In the list of perennials the plants are arranged under their month of bloom, though of course they are not confined strictly to the one month, but "lap on" at both ends to the month that is next. With the annuals, it is impossible to give the period of blossoming, for this depends entirely upon the time of sowing, as I have already

said. The average height is given, which will help you determine the location of the variety and also the color, which makes a difference in the position of one kind with regard to another. There is also a suggestion about soil and sunlight in each case.

1.—Pansies—of course you will have these—are one of the easiest things to grow as well as one of the most satisfactory, and they have the added interest of being one of the oldest garden flowers known. Their parentage is very obscure, but they are supposed to be descended from a wild European violet—*Viola tricolor*. The hot American climate is not the best for them, therefore give them a spot rather shaded from all but the morning sun and a soil that is rather clayey, but well enriched. You can get them in one solid color or in a mixture so varied that it is impossible to tell what the predominating color is. The average height is six or seven inches. Seed sown now will give blossoms by midsummer. It is usually best to sow seed in autumn for the next season's plants.

2.—The ragged-sailors—or bachelor's buttons—or corn-flowers or blue-bottles or sweet sultans, whichever you choose to call them—must be included, of course. I would advise the regular ragged-sailor—*Centaurea Cyanus*—for its color and general individuality. Sow these very early outdoors, and you will have bloom in a short time. They will come up from self-sown seed in succeeding years once they are established. The plants are usually about eighteen inches high.

3.—The old fashioned lady's-slipper—*Impatiens Balsamina*—comes in a double or camellia-flowered form which is quite as easy to grow as the single variety and far lovelier. Start these in the house now in a rich sandy loam, and be sure that the plants always have plenty of moisture. Pinch in the shoots to make them grow into compact specimens—this, of course, after transplanting and establishing out-of-doors. Let them have hot sun, for the plant is a native of India. The colors are innumerable; the height is from twenty-four to thirty inches.

4.—Ageratum is known to us by its true name quite as well as by its nickname of floss-flower. It blossoms all the time once it gets started, and in the blue shades it is one the finest and showiest things imaginable. It is always difficult to get good blue flowers, so have this by all means. Sow the seed now indoors and transplant in May or early June into almost any kind of soil, setting the plants about nine inches apart. Get a dwarf form; the "dwarf Princess Pauline" is excellent. It is about eight inches high.

5.—Poppies must not be transplanted, as they do not stand it well. Select a mixed strain of the Shirley variety, and you will have everything lovely that the poppy has to offer. They grow on an average from three to four feet high, and the colors are gorgeous. A sandy loam is the best soil for them.

6.—Petunias are one of the loveliest flowers in the world I am certain—not the old single kind, but the exquisite frilled and ruffled and fringed wonders of the newer double varieties. Sow the seed in a box indoors and keep it in a warm window where sunlight falls. When transplanting, put them about a foot apart. The colors are almost limitless, and once you have the seeds fairly started, the plants will grow almost like weeds. Be careful of them until they are well started, however, as the double kinds especially are delicate to keep "just right" in the matter of warmth and moisture. Water these a little more freely than the single. Give them the ordinary good soil and a sunny location and they will blossom all summer.

7.—Snapdragons—*Antirrhinum*—do not find their way into the garden lists as often as they should. Strictly speaking, they are perennials, but as they bloom the first year from seed, they are treated as annuals. Sow indoors for early bloom and again outdoors as soon as the frost is gone. They like a soil that is warm and dry and fairly rich. The height is about eighteen inches, and there is a great variety of color.

8.—Of course there is no garden complete nowadays without some salvia. The standard variety is *Salvia splendens*. Sow the seed indoors now, and set the plants out the last of May. Give them an ordinary light soil. The familiar scarlet is too well known even to need mentioning.

9.—The African marigolds are among annuals what the pompon chrysanthemums are among perennials. The warm, glowing yellows are the one color which effectually drives away the mists of autumn and cheers one up in spite of rain or clouds, blazing like a torch in the garden's midst. These will be ready for blossoming in time if they are sown in the open ground. There are different heights, ranging from eighteen to twenty-four inches, and the usual soil is suitable for them.

10.—Sweet scabious or mourning-bride, as some call them—why, I am sure, I never could guess—are beautiful in the garden and equally lovely cut and in bouquets. There are many shades and colors, and the flowers are lavishly produced. Ordinary garden soil suits them; the height is from twenty to thirty-six inches.

11.—Asters are unrivaled for variety of size as well as color, and they are almost enough in themselves to fill a garden. There is nothing in their culture except keeping them free from disease, and this is easily accomplished by care in the use of manure. Never use any but thoroughly rotted manure well mixed into the soil, and stir unslaked lime or fresh wood ashes into the surface of the ground around them. They need this for a tonic and to keep the roots free from insects as well as disease. Plant the seed indoors now and transplant outdoors when the plants have

four or five leaves, setting them about eighteen inches apart. The average height is twenty-four inches.

12.—Stocks—gilliflowers—complete the list. They are so well known that it seems superfluous to say much about them. They haven't a fault, and if you wish you can take the plants up in the fall and they will keep on blossoming all winter if the room is cool and moist. Sow the seeds now, transplant the seedlings when they are an inch high into other boxes or small pots, and transplant finally outdoors on a cloudy May day. Let them have a deep, rich soil. There are all colors, but nothing excels the white. The height is from twelve to eighteen inches.

#### A Dozen Perennials for the Flower-Garden—February, March, April

1.—*Helleborus niger*—the Christmas rose—sometimes blossoms earlier than February, warm days bringing the blooms out in December or January. Ordinarily garden soil will do nicely, but better results are obtained with a mixture of rich loam and sand with a top dressing of manure. Once started, do not disturb the plants. The color is white and the height about six inches.

2.—*Adonis Amurensis*—a form of pheasant's-eye—has large yellow flowers, is about twelve inches high, and grows in any good light, moist earth in full sun or partial shade.

3.—Trilliums grow ordinarily in a damp and shady place, but they will do well without the moisture if the shade is supplied. The variety *grandiflorum* is the great white one, very showy and beautiful.

#### May

4.—The dear old sweet-william—*Dianthus barbatus*—comes in a mixture of colors, and grows to be from eighteen to twenty-four inches tall. It will grow anywhere, and it is deliciously fragrant.

#### June

5.—Iris dominates the garden this month, both the German and the Japanese varieties being in full bloom—a wonderful riot of color. These range from eighteen to forty inches in height. Put them in a sunny place in light but rich sandy soil which is well drained, and give them plenty of water.

#### July

6.—Hollyhocks—*Althea rosea*—must be in evidence, of course. These will grow in any good soil, and come now in the most wonderful double and ruffled varieties. The colors are very delicate and beautiful; the average height is from four to six feet.

7.—This month the perennial phlox, too, will make its display. The colors are so numerous that it is only a question of choosing a favorite. Be careful, however, and do not get reds and magentas that will clash. These colors are very distinct in phlox, and a mistake is well-nigh unbearable. The plants are tall and

short—from two to five feet. It wants a warm, sunny place and rich soil, tho it will grow in very poor earth.

#### August

8.—The Chinese larkspur—*Delphinium Chinense*—in all its varying shades of blue, as well as the white variety, is beautiful this month. It is about eighteen inches high, with a pleasing foliage, and it blossoms freely. Prepare the soil quite deep. They prefer a rich sandy loam with full sun.

9.—The double white yarrow known by the name of *Achillea ptarmica*, var. *fl. pl.*, blossoms really all summer instead of during the month of August. It is one of the very best flowers for cutting that there is. It averages from twenty to twenty-four inches in height, and any garden soil suits it."

#### September

10.—The hardy asters, commonly called Michaelmas daisies or starwort, furnish a multitude of flowers during this month. Blues, amethysts, lilac shades, and white are among the colors. The height runs all the way from eighteen inches to nearly five feet, the latter being almost shrubby in their growth. Ordinary soil and almost any situation suits them.

#### October

11.—The exquisite Japanese varieties of the wind-flower—*Anemone Japonica*—begin blossoming in August and continue until frost kills them back, but not until this month does one realize their full loveliness. They are a mass of bloom, and the blossoms are large and showy, ranging from a rosy pink which is almost red up the scale through all the delicate shades until white is reached. The plants are about two feet high. Any soil will do, but they like best a rich, well-drained, sandy loam.

#### November

12.—Frosty as this month may be, the hardy pompon chrysanthemums are undaunted, and usually hang on till the end. Almost every warm shade is represented from red to deep brown, with white for a relief. The catalogs tell you that there are all colors except blue, and I do not know but that this is literally true. There are plenty to choose from anyway. The height is from twenty-four to thirty inches. The usual garden soil suits them.—*The Circle*.

#### A BREEZE FROM SOUTHLAND.

J. I. MILLER.

SPRING is here in all her splendor and loveliness. The forest trees, shrubbery and fruit trees have put on their summer gowns. Peaches, that is, early ones, are as large as hazelnuts, while later ones are not yet in blossom. Almost all kinds of spring crops in gardens and fields have been and are still being planted, except rice and cotton which will commence in a few days.

Strawberries have been a part of the bill of fare for the past ten days.

Sunday, March 1, while Indiana and other states were having sleet and snow, we had an ideal spring day. Men in shirt sleeves and children running about in bare feet. In fact some children put on shoes but very seldom in winter in the lower South.

So far March has given us almost continual sunshine. We often wonder why more people do not come south to spend their winters, in place of going through the long cold winters of the north.

*Roanoke, La.*

[The writer of the above has been so long in the South that he has forgotten about the feeling of renewed strength and vigor that the northerner receives from his bracing atmosphere. Almost without exception people like to contemplate life in a warm, sunny climate, but at the same time it must be confessed that our northern winters hold no small influence over our health and industrial departments.—The Editor.]

### SERMONS FOR UNCONVERTED NEEDED.

THAT there has been a decline of "direct, pointed, faithful and persuasive preaching to the unconverted" is the opinion of a writer in the *Philadelphia Presbyterian*. "Preaching to Christians," he notes, "has been relatively overdone, and preaching to the impenitent underdone." Those who are occupying the pulpits, he says, should remember that "the most successful preachers, from Whitefield and Wesley on to Spurgeon and Moody, were men whose chief aim was to awaken the unconverted, and to lead them straight to Jesus Christ. Spurgeon never had any 'revivals' in his great church; and for the good reason that there were no spiritual declensions to be derived from. He sowed the Gospel with one hand, and reaped conversions with the other. Unless a minister intensely loves souls, and longs for souls, he will never save souls; if he does, and uses the right means seasoned with prayer, God will give souls converted as his rich reward. In my own experience of forty-three years of pastoral work, I delivered hundreds of discourses to the impenitent, and did not limit them to seasons of special outpourings of the Holy Spirit."

If you wish to look at a portrait of Raphael's, what would you think to see only the forehead uncovered, and then only the eyes, and so on, until all the features had been separately seen? Could you gain a true idea of the picture as a whole? Yet this is the way men look at the picture of Christ in the Gospels, reading a few verses and mottoes here and there, and never considering the life in its wholeness and harmony.—*H. W. Beecher.*

### KNOCK AND IT SHALL BE OPENED.

In two passages of Luke's Gospel, Jesus sought to teach his disciples the necessity of "importunity" in prayers. In the eighteenth chapter he shows how impossible it is that prayer should be unanswered, by invoking the parable of the unjust judge. Prayer is made an argument even in the view of one who feared not God, neither regarded man. And so it must be that the Judge of all the earth, infinite in love and mercy, will honor the importunities of his children. In another chapter of the same Gospel the grounds for faith are deduced from the parable of the midnight visit. The right of friendship is urged as a reasonable incentive to prayer, and the guarantee of a kindly audience. Even though friendship's bond were not strong enough to insure the needed supply, the desire to be freed from the entreaties of his visitor will determine his consent.

God can and will interpose his direction into the business of his children. The devotion of the saints is not blind, but is based on the promise and the experience of answered prayer. Nothing is better assured in the actual sayings of Jesus. No word rings more clearly in the testimony of the apostles. Nineteen centuries of Christian discipleship have wrought the conviction of it into the life and character of the church.

There are some who hold that the events of human life are the chaotic issue of chance, that God has no personal concern in the affairs of men, that the misery and distress of the world, its woes and blessings are the gamble of inscrutable forces. There are those who attribute the happenings of time to a fixed law, beyond the influence of human agency, beyond even the power of God to disturb or amend. To the "naturalist" prayer is unreasonable, a folly of weak minds, but faith knows that God can and does answer prayer.—*Home Herald.*

### HOPE IN THE RESURRECTION.

Shall I dread the day which cometh  
As a thief in darkest night?  
Shall my coming dissolution  
Leave me not a ray of light?

Shall the grave my soul in darkness  
Hide forever in dismay?  
No! there's hope in my Redeemer,  
In him dawns the glorious day.

He has brought me joy and gladness:  
For my soul he came to save.  
He upon the cross has suffered;  
There for me his life he gave.

Glory to the Blessed Savior,  
Who expired upon the tree;  
He has triumphed over Satan,  
He has come to set me free.

Death has lost its sting and terror.  
Life eternal mine shall be;  
Glorious resurrection morning  
When my Savior I shall see.

—*Virgilla Mast.*

## CREAM OF MAGAZINES

### SALE OF STOLEN ARTICLES.

Attention has been called both by the secular and the religious press to a recent sale in New York of rare and costly objects of Chinese art owned by Mrs. Conger, wife of our Minister to China during the Boxer uprising. Quite generally the press has referred to these things as "loot," though The Congregationalist and Christian World (Boston) asserts that the objects were purchased from the despoilers by Mr. Conger "after the looting was over and the thieves sought a market for their spoil." Among the pieces of the collection were several sacred relics, and The Western Christian Advocate (Cincinnati) avers that "so anxious are the Chinese to obtain possession of some of the sacred pieces that their secret agents were at the scene of the sale to bid them in." The Congregationalist comments:

"We wish, in the interests of good neighborhood and the example which a Christian nation ought to set, that the disposal of these goods could have been managed differently. For they belonged to the intimate or the ceremonial life of the monarchs of China. There were garments of state, each in its own color, for the use of the Emperor and the princes and princesses—all ornamented with priceless embroidery. There were the adornments of the private rooms of the imperial family. There was a bell which was sacred to one of the chief religious conceptions of the Chinese people, which was rung only once a year, when the Emperor went out to usher in the spring by worship and the opening of the ground by himself holding the plow. There is something of the old days of barbarism in the exportation, under the sacred rights of an ambassador, of objects so intimate or of such religious worth, from the land where they had their meaning, to become mere objects of art held for a while for private admiration and then advertised and sold to the highest bidder at public vendue. We wish it had been possible for our Government, or at least for a voluntary association of American citizens, to have purchased the collection and returned it to the Chinese Emperor. It would have been a fit protest against the wrongs which China suffered at the hands of foreign soldiers—in which, we are glad to say, the American expeditionary force had little or no share."—Literary Digest.

### OUR SCHOOLS.

Schools are only a means to an end, and education itself, in its last analysis, is simply character building. The young man just out of college is really only beginning his real education, unless he has been unusually fortunate in his environment and in his early mental attitude toward life. He has, or should have, an advantage over his less favored fellows. Unfortunately, results too often show that either the schooling has been defective or he has failed to take advantage of his opportunities, for school is little more than an open door to opportunity in life. Thousands close this as well as other doors of opportunity and write failure against their

lives. The fault is partly in themselves and partly in our system of education. Any school may be made the best in the world if only the boy has the willing mind, and the best in the world is useless without the coöperation of student and parents.

The bulk of primary education is provided at public cost. We are proud of our "common schools"—though they are far below what from an ideal standpoint they should be. No teacher is physically or mentally competent to give proper instruction to forty children, which is the average size of a division in the public schools. Under such conditions individual instruction is largely impossible and must be devoted principally to the laggards at the expense of the brighter children—or vice versa. Nevertheless, comparatively speaking, our common schools do give good instruction. It is amazing that so much is accomplished under such difficulties. It is because the average teacher—usually a woman—gives of her vitality and sympathy and mental force to an extent which is abnormal and deplorable, that the children of tender years are so well grounded in the elements of knowledge. The time will come when no such task will be placed on the young women of this country, and when the teachers will not only be honored but well paid for their services. It may be said that primarily the need of the public schools is a reduction of the number of children in a division to twenty-five as a maximum. It would be better to place the number at twenty. It would pay in every way.—From "Educating Our Boys," in March Lippincott's.

### THE FUTURE OF RACIAL HATRED.

In regard to the anti-Japanese riots in California and Vancouver I am not inclined to look upon them as being serious from a general viewpoint. I am not prepared to state the cause of these riots from personal investigation, but judging from reports I conclude that they must be as follows:

First, the difference of traditions, customs and manners of living between the Japanese and Americans. Second, there is still a great gulf between the standard of living of these two peoples. Third, the number of Japanese immigrants has greatly increased in recent months. Fourth, these facts were used as fuel on the fire of the anti-Japanese movement by certain leaders of the American workingmen.
